# INDEX OF CONTENTS

TO THE

# GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE,

## For 1851.

A.

Accounts, farm, 9, 27, 153, 689, 765
Acer circinatum, 791 ; villosum, 791
Acineta Humboldti, 645 ; Barkeri, 645
Acre, English and Irish, 268, 317 ; Scotch, 317, 349 ; Cheshire and Lancashire, 348 ; Worcester, Stafford, and Shropshire, 429 ; Cornish, 445
Adamia versicolor, 230
Advertisers, hints to, 358, 390
Aerides crispum, 612 ; odoratum, 612 ; affine, 612 ; maculosum, 612 ; roseum, 612 ; virens, 612
Æsculus rubicunda, 406
Agapanthus umbellatus, 694, 710
Agriculture, experiments in, 9 ; Calvert's pamphlet on certain Laws Affecting, rev., 26 ; improvement in, 43, 91, 171, 395 ; in North Devon, 73, 90 ; English, 57, 74 ; Scotch, 11, 57, 89, 171 ; Irish, condition of, 92, 187, 204, 235, 268, 300 ; Mr. Pusey on, 89, 140, 171 ; Liebig's critique on ditto, 443 ; Tullian, 138, 141, 153, 186, 236, 267, 282, 362 ; improved, 170, 238 ; use of salt in, 187 ; Prof. Way's lecture on ditto, 365 ; on the employment of gypsum in, 412 ; on lime in, 540, 589 ; Johnston's Notes on North American, rev., 265, 317 ; and steam power, 393 ; and protection, 444 ; Word in Season respecting, 445, 669, 698, 745 ; Russian, 523 ; examples of, 522, 538 ; French, 538, 572 ; in North Yorkshire, 621 ; in Australia, 635, 700 ; in Canada, 699 ; in Lancashire, 700 ; Irish, 729 ; Dr. Daubeny's lecture on what chemistry has done for, 730 ; systems of, 793
Agricultural carriages, 13 ; height of, 77 ; in the Crystal Palace, 458
Agricultural chemistry, 425, 441, 457, 474, 504, 627, 730, 763
Agricultural education, 27, 219, 265, 268, 278, 281, 297, 332 ; Mr. Lawrence on, 73
Agricultural labourers, 106, 364, 411, 428, 444, 505, 572, 604, 617, 652 ; cottage for, 75 ; plan of stove for, 454, 518 ; beer for, 475, 522, 636
Agricultural implements, grease for, 13 ; chaff cutters, 28 ; Oat bruisers, 28 ; grubbers, Scoular's improved, 53 ; Tennant's ditto, 461 ; subsoil ditto, 475 ; subsoil ploughs, 221 ; at the Crystal Palace, 281, 297, 314, 315, 330, 345, 361, 363, 364, 373, 394, 410, 426, 441, 458, 474, 490, 508, 509 ; list of prizemen for, at ditto, 429, 477, 490, 559 ; Agricultural Society's schedule of prizes for 1852, 573
Agricultural geology, 313
Agricultural Physiology, by Dr. Kemp, rev., 38
Agricultural statistics, 668 ; of Ireland, 537
Agricultural tour, 61 ; Mr. Mechi's to North Devon, 73, 90
Allamandas, 534 ; culture of, 71
Almanack, Glenny's Garden, rev., 759
Aloes, hardy, 518 ; American, 518, 597, 614
Allotments, culture of, 269, 459 ; rotation of crops for, 316
Alumina, action of, on vegetation, 283
America, horticultural meetings in, 23 ; gardening in, 88 ; Johnston's Notes on North, 265, 317 ; Wheat soils of, 413 ; phosphate of lime of, 539, 555 ; reaping machines, 538, 553, 554, 585, 606, 700, 717, 746, 747, 781 ; Baily on, rev., 551 ; Victoria regia in, 743
American blight, 56
American Poulterer's Companion, rev., 236 ; Poultry Book, rev., 284 ; Flora, Popular Nomenclature of, rev., 662
American plants, Mr. Waterer's exhibition of, 359
American churn, 411 ; ditto and English, 765
Amherstia nobilis, 39 ; at Frogmore, 167 ; at Ealing-park, 231
Ammonia, absorption of, by soils, 164, 195, 212 ; escape of, 809 ; to fix, 822
Analyses, 396 ; of common Sedges, 43 ; of Carex muricata, 40 ; of Oak husks, 109 ; of Barley ashes, 170 ; of clay soils, 283 ; of Australasian guano ; 381, 761 ; of Bolivian guano, 510 ; of gypsum, 412 ; of America phosphate of lime, 555 ; of peat, 535 ; of pinguedo, 716
Angræcum bilobum, 549 ; caudatum, 645
Anguloa Ruckeri, 517
Animals, Irish moss as food for, 10 ; and plants, difference between, 28 ; nourishing fluid of ditto, 28 ; uses of salt in the food of, 187 ; sugar in, 323 ; Prof. Symonds' lecture on the action of salt on, 379 ; periodic phenomena of, 484 ; apparatus for milking, 590 ; flesh of, as manure, 650
Animal substances, to preserve, 552
Animal and vegetable life, 515
Animal manures, 505
Annihilator, Phillips' fire, 231, 723, 773
Annuals, length of fibrous roots of, 70
Ansellia Africana, 500
Antennaria Stephensii, 563
Ants, to kill, 71, 293, 424
Aquatics, 5, 147, 197, 280, 310, 420, 469, 485, 501, 502, 517, 536, 614 ; stove, 197, 214, 215, 230 ; depth of water for ditto, 502 ; for a pond, 728
Aquilegia seed, to sow, 168
Aponogeton distachyon, 296
Apples, for a sea-side garden, 24 ; to keep, 72 ; Blenheim Orange, 228 ; Normandy Pippin, 344 ; singular bloom of, 406 ; Ribston Pippin, 614 629 ; Redstreak, 614 ; for espaliers, 648 ; table, 808 ; kitchen, 808 ; fungi on, 819
Apricots for a sea-side garden, 24 ; disease in, 664
Araucaria imbricata, 501
Arboriculture in Scotland, 692
Arctic voyage, by R. A. Goodsir, rev., 23
Arpophyllum giganteum, 517
Art v. nature, 454
Artificial manures, 10, 164, 331, 435 ; adulteration of, and the means of detection, 477
Artichokes, globe, 117
Arums, 88
Arundina densa, 517
Asparagus, 84, 391 ; to force, 134, 245, 277, 326, 341, 373 ; to salt, 168 ; cutting of, 357, 440 ; to transplant, 712
Aspasia lunata, 480
Association, British, 452, 468, 484, 516, 533, 548, 564, 595, 612
Astyages, Pear tree, 357, 373, 390
Atmosphere, 569 ; of plants, 403, 419
Atriplex hortensis, 51
Auckland Islands, vegetation and climate of, 103
Auricula, properties of, 424
Australia, guano of, 380, 686 ; analysis of ditto, 381, 761 ; flora of, 503 ; emigration to, 550 ; agriculture in, 635, 700
Aviaries, fountains for, 22
Azalea gardens, Chinese, 5, 228

B.

Baily's America, rev., 551
Baily on the Dorking fowl, rev., 284
Balsams, 376 ; from cuttings, 388 ; seed of, 390
Banana, the, 805
Banks, penny saving, 278, 310, 358
Bantams and woodlice, 277
Barkeria spectabilis, 693 ; Skinneri major, and Skinneri, 693
Barley, culture of, 169 ; analysis of ashes of, 170 ; seed, 219 ; after Wheat, 827
Barometers, to place, 408
Bats and fireflies, 789, 806
Beans, 100 ; culture of, 10, 138, 668 ; as food for cattle, 61 ; French, 68 ; drill culture of, in Belgium, 347 ; disease in, 531
Beech on an Oak, 757
Beech trees, 118 ; bleeding in, 740
Beer, 475, 522, 636 ; bitter, 733
Bees, 38, 87, 182 ; swarming of, 519 ; robber, 533 ; wild, to remove, 568 ; gas-tar walks and, 822
Beehives, 358, 504 ; in the Crystal Palace, 755 ; construction of, 755, 789
Beet, expenses and returns of an acre of, 601 ; sugar, 329, 332, 521, 539, 571, 587, 601, 620 ; field, 587
Beetle, scarlet-backed cowled, 85
Beetle traps, 680
Begonia fuchsioides, 87, 118, 134, 166 ; cinnabarina, 760
Belgium, drill culture of Beans in, 347
Bement's American Poulterer's Companion, rev., 236
Berberis aquifolium, to sow, 696 ; nepalensis 807
Berberry wine, to make, 197
Bermuda, Oranges, &c., in, 339
Binns' Notes on Lancashire Agriculture, rev., 700
Birds, British song, 392, 405, 422, 438, 502, 596, 612, 629, 645, 660, 677, 692, 708, 724, 739, 756, 772, 788, 820 ; management of, 4, 20, 36, 53, 68 ; canaries, 85, 100, 116, 149, 165, 181, 196, 212, 228, 244, 260, 308 ; nightingales, 275, 292, 325, 341, 356, 388, 404, 421, 436, 469, 486, 501, 517, 534, 759 ; Virginia ditto, 566 ; blackcaps, 452, 468, 500, 517, 532 ; garden warbler, 548 ; white-throat, 564 ; babillard, 581 ; whydak, 8, 24 ; and white fruits, 70 ; fountains for, 22 ; skylark, 203, 219, 268, 283, 300, 317, 332 ; longevity of ditto, 87 ; to keep from fruit, 134 ; migratory, 277 ; canaries in the open air, 534 ; cuckoo, 309, 454, 469, 485, 741, 770 ; to keep off Gooseberry and Currant tree buds, 438, 806 ; hedge sparrow, 502 ; swallows, 501 ; parrots, 822 ; disease in ditto, 438, 454, 469 ; swifts and hornets in Yorkshire, 566, 597 ; mocking, 610, 661, 678 ; rooks, habits of, 629, 646 ; thrush, performances of a, 742 ; Knox on Game, &c., rev. 774 ; singing hens, 790 ; robin, audacity of, 822
Birds' nests, 455
Biscuit, Borden's meat, 629, 662
Black-caps, 452, 468, 500, 517, 532
Blaine's Canine Pathology, rev., 637
Bletia patula, 693
Blight, 501 ; American, 56 ; in Wheat, 92 ; Peach tree, 486
Boilers, Cornish steam engine, 283 ; incrustations in, 327
Bones as manure, 650, 715
Bone dust as ditto, 430
Books reviewed : Townshend's Rambles and Observations in New South Wales, 6 ; Dickson on the Breeding and Management of Animals, 13 ; Goodsir's Arctic Voyage, 23 ; Kemp's Agricultural Physiology, 28 ; Calvert's Pamphlet on certain Laws affecting Agriculture, 26 ; Rivers' Orchard House, or Cultivation of Fruit Trees under Glass, 35 ; Lawrence on Agricultural Education, 73 ; Robin on the Reproductive Organs of Plants, 103 ; Fresenius' Contributions to Mycology, 119 ; Linné's Nemesis Divina, 135 ; Pusey on what ought Landlords and Farmers to do ? 140 ; Ehrenberg on the Dust carried by the Trade Winds, 151 ; on Sugar, 168 ; Hooker's Rhododendrons of Sikkim Himalaya, 163, 787 : Richardson on Domestic Fowl and Ornamental Poultry, 173 ; Payer on Cryptogams, 183 ; Deman on the Cultivation of Flax, 205 ; Considerations for extending the Cultivation of ditto, 205 ; Warnes on ditto, 205 ; Brown on ditto, 589 ; Cotton, 205 ; Bement's American Poulterer's Companion, 236 ; Johnston's Notes on North American Agriculture, 265 ; Donald on Land Draining, 269 ; Baily on the Dorking Fowl, 884 ; Cook's American Poultry-book, 284 ; Sanders on the Vine, 327 ; Dean's Land Steward, 361 ; Paul on the Culture of Roses in Pots, 391 ; Dixon's Dovecote and Aviary, 407 ; Brown's Pamphlet on Fumigation, 413 ; Irmisch on the Classification of Bulbs and Tubers, 423 ; Vasey on the Delineation of the Ox Tribe, 429 ; Morris's Naturalist, 439 ; Eyton's Herd Book of Hereford Cattle, 461 ; Boswell's Poultry Yard, 471 ; Reid on the Steam Engine, 487 ; Latham's Ethnology of British Colonies, 503 ; Traveller's Library, 503 ; Knight's Curiosities of Industry, Historical and Pictorial Half Hours, 503 ; Miss Carlow's Drops of Water, 503 ; Gilbert's Guide to London, 503 ; Hunt's and Jerrold's Hand Books to the Great Exhibition, 503, 597 ; Bingham's Photogenic Manipulation, 503 ; Murray's Modern London, 519 ; Colonial Magazine, 525 ; Wight's Indian Orchids, 534 ; Baily's America, 551 ; Cuthill's Market Gardening, 551 ; ditto, Instructions on the Potato, 606 ; Manchester Agricultural Society's Journal, 573 ; Ward's World and its Workshops, 598 ; Midland Florist, 599, 727 ; Beck's Florist, 39, 599, 727 ; Floricultural Cabinet, 599, 727 ; Gardeners' Magazine of Botany, 599, 727 ; Hogg's British Pomology, 614 ; Turner on Training Horses, 622 ; Blaine's Canine Pathology, 637 ; De la Beche's Geological Observer, 646 ; Seeman's Popular Nomenclature of the American Flora, 662 ; Paul on the Hollyhock, 663 ; Word in Season, or a pamphlet on Corn Growing, 445, 669, 698, 745 ; Lady Clutterbuck's Cookery Book, 679 ; Murray's Railway Literature, 679, 743 ; Longman's Travellers' Library, 679 ; Wheatley, on the Rod and the Line, 695 ; Bian's Notes on Lancashire Agriculture, 700 ; Prince Albert's Portrait, 710 ; Hooker's Species Filicum, 711 ; Pulman on Trout Fishing, 711 ; Crabb's Technical Dictionary, 711 ; Book of the Salmon, 726 ; Ferguson and Vance, on the Tenure and Improvement of Land in Ireland, 729 ; Ivory on the Chrysanthemum, 742 ; Fly Fishing in Salt and Fresh Water, 743 ; Layard's Nineveh, 743 ; Sir Joseph Paxton's Portrait, 775 ; Glenny's Garden Almanac, 759 ; Knox on Game Birds, &c., 774 ; Country House (the Poultry-yard), 807 ; Moore's History of Ferns, 823 ; Family Economist, 823 ; Paxton's Flower Garden, 823 ; Birmingham Magazine, 823
Borders, fruit tree, 54
Borneo, vegetation of, 695
Bostrichus capucinus, 85
Boswell's Poultry Yard, rev., 471
Botanic gardens, Edinburgh, 6, 56 ; Cambridge, Mr. Stratton's appointment to, 71 ; Swedish, 307 ; Chelsea, 391
Botanical geography of part of the Himalaya and Thibet, 612
Botanical names, 309 ; old, 502
Bouquet trade in New York, 118, 150, 182
Box-feeding of cattle, 221
Brassia Wrayæ, 500 ; caudata, 500 ; verrucosa major, 500 ; Lanceana, 500 ; macrostachya, 500 ; maculata major, 645
Bread, to obviate the bitter taste in, 526
Brewing, 43, 139, 636
Bridges, moveable, 557
Bricks, embossed, 685
Brickmakers, hint to, 54
Britain, climate of, 323, 339
British Association, 452, 468, 484, 516, 533, 548, 564, 595, 612
Broccoli, 117, 132, 694, 742 ; Snow's, 118, 214 ; fungi on, 379 ; select, 710, 726
Browæa coccinea, 70
Broughtonia sanguinea, 580
Brussels Sprouts, 117
Buckwheat, culture of, 363, 422
Buds, growth of, 259
Budding, Foulstone's new instrument for, 326
Plums and Cherries, 406
Buildings, farm, 284, 285, 300, 667 ; paint for ditto, 170, 187 ; new mode of ventilating public, 781
Bulbs, Cape, 184 ; garden, 229 ; and tubers classification of, 423 ; common hardy, 742
Bullocks, to clip, 748, 779
Bunny's (Mr.) nursery noticed, 519
Butter, Turnipy, 827

C.

Cabbages, 37, 44 ; Enfield, 69 ; Shantung, 87 Drumhead, 93, 398 ; club in, 136 ; crops of 314
Cacti, 134, 454 ; to graft, 22, 70
Calanthe veratrifolia, 532 ; flava, 532 ; bicolor, 693
Calceolarias, 262, 278, 293, 310, 328, 341, 358, 373 ; bedding, 200, 232, 661, 709
Calico, glaze for, 184
California, Pine and Cedar forests of, 103
Calla æthiopica, 822
Calves, slipping, 140 ; drop after, 334
Calvert's (Mr.) pamphlet on the Laws Affecting Agriculture, rev., 25
Camarotis purpurea, 645
Cambridge Botanic Garden, Mr. Stratton's appointment to, 71
Camellias, culture of, 21 ; method of compelling the buds of reticulata to develop, 71 ; Messrs. Chandler's, noticed, 151
Campanula vidalii, 136, 150
Canada, horticulture in, 535 ; agriculture in, 694
Canaries, management of, 85, 100, 116, 149, 165, 181, 196, 212, 228, 244, 260, 308 ; in the open air, 534
Canna, to grow in water, 551
Canvas, composition for waterproofing, 104
Cape bulbs, 184
Cape Pelargoniums, select, 536
Carbonic acid, 403, 419
Carriages, agricultural, 13 ; grease for, 14 ; height of, 77 ; in the Crystal Palace, 458
Carnations, in pots, 166 ; duration of, 440 ; show of, 502
Carrots, 53 ; Siamese, 67 ; culture of, 202, 218 ; winter, 645, 661 ; fatting early lambs on, 652
Caterpillars, to kill, 71
Cattle, Dickson on Breeding of, rev., 13 ; linseed as food for, 28 ; Beans as, 61 ; early spring, 253 ; best method of storing Turnips for, 61 ; hides of, 73 ; qualities of ditto, 106 ; on boarded floors, 154, 682, 748 ; shorthorned, 173 ; use of salt in food of, 187 ; to feed, 109, 221, 348, 444, 602, 748 ; report of the Agricultural Society's meeting of, 459, 475, 492 ; analyses of, 461 ; ditto from 1847 to 1851, 476 ; fat and imperfect, 572 ; Eyton's Herd Book of Hereford, rev., 461 ; West Highland, 523 ; Birmingham show of, 286, 701 ; report of ditto, 797, 812, 825, 827 ; Smithfield, 27 ; report of ditto, 796, 811, 825 ; summer feeding of, 590 ; marketing of, 602 ; paving for stall of, 829 ; clipping, of, 748
Cattleya Skinneri, 453 ; Mossiæ, 453 ; crispa, 453 ; superba, 453 ; labiata, 453 ; pumila, 453 ; Loddigesii, 453 ; Harrisoniæ, 453 ; violacea, 453 ; guttata, 453 ; candida, 453 ; intermedia, 453 ; granulosa, 453 ; Walkeriana, 581 ; citrina, 693

Cauliflower, 37 ; cultivating and preserving of, 247
Ceanothuses, 310
Celery, 37 ; and Onions, 582 ; to blanch, 661
Cells, plant, composition of the walls of, 199
Cement, for tanks, 166 ; for stone, 599
Cereus, night blowing, 358
Chaff-cutters, 28 ; in the Crystal Palace, 410, 426 ; Ferrabee's, 523
Chandler's (Messrs.) Camellias noticed, 151
Chapman's (Mr.) forcing ground, 87
Charcoal, peat, 12, 84, 132, 150, 231, 238, 342, 459, 518, 589, 621, 713, 733, 811 ; Rogers' patent for making, 241 ; preparation of, 268 ; to make, 397, 428, 509 ; and guano, 468 ; chemical products of, 535 ; to burn, 691
Cheese, cream to make, 781, 827
Cheiranthus Cheiri, monstrosity of, 564
Chelsea Botanic Garden noticed, 391
Cheltenham Flower Show, 421, 437
Chemistry, organic, 323 ; agricultural, 425, 441, 457, 474, 564, 627, 730, 763 ; of vegetation, 643
Cherries, for a sea-side garden, 24 ; to train, 213 ; for marketing and succession, 120 ; Morello, 259 ; to bud, 406, retarded, 678, 694, 821
Chestnut, Spanish, 182, 198, 211, 214, 230, 262
Chicory, 187, 536, 633 ; to force, 134 ; soil for, time of sowing, seed required for an acre, cultivation and harvesting, 154, 251 ; culture of, 379
Chinese Azaleas, 5, 228 ; Primulas, 215 ; Glycine, 340, 343 ; horticultural shows, 679
Chiswick, exhibitions at, 291, 371, 467 ; report of ditto, 293, 374, 469 ; list of awards at, for May, 290, 310 ; for June, 370 ; for July, 466 ; schedule of prizes for 1851, 130 ; ditto for 1852, 530 ; remarks on ditto, 583, 711 ; new regulations at, 115, 168 ; v. Rokham temperature, 118 ; garden noticed, 39, 263, 359, 598 ; fruit at, 373, 389 ; yellow Roses at, 391, 405, 422 ; Fellows' rights, 388 ; exhibitions, 517 ; Orchids at, 740 ; Pelargonium growers at, 244
Christie (Mr.), death of, 71
Chrysanthemums, 69, 262, 310, 695, 823 ; descriptive list of, 69 ; cultivation of, 151, 183, 261 ; spring, 214, 230 ; shows, 151, 183, 647, 727, 743, 775, 790, 807 ; Ivory's, 742, 757 ; Mr. Salter's, 807
Church leaseholds, 509
Churns in the Crystal Palace, 458 ; American, 411 ; ditto and English, 765
Chysis bractescens, 549
Cinerarias, 711 ; select, 136, 599, 711
Cirencester agricultural college, 265, 826 ; examination paper of, 458 ; answers to ditto, 521
Cirrhopetalum Thouarsii, 581
Citrus japonica, 40
Claremont, gardens at, noticed, 679
Claussen, Chevalier, on the cultivation of Flax and Hemp, 107, 123, 155
Clay soils, 41 ; analyses of, 283
Climate of Auckland Islands, 103 ; of Britain, 323, 339 ; remarks on, 341 ; of Torquay, 391, 406

Garden walks, to make, 245, 518, 533, 550 ; Fleming's machine for killing weeds on, 275, 357, 372, 390, 452, 533 ; to salt, 391, 406, 452, 484, 502, 517 ; quantity of ditto to apply to a gallon of water for killing weeds on, 520 ; asphalte, 501, 659 ; tarred, 677, 678, 694, 822 ; lead refuse, 694
Gardeners' Benevolent Institution, 151, 213, 326, 340, 647 ; anniversary of, 372, 389 ; Mr. Aiton's bequest to, 516
Gardnerian herbarium, 343
Gas, carbonic acid, 403, 419
Gas lime, 430
Geography, Botanical, of part of the Himalaya, and Thibet, 612 ; ditto, of Western Thibet, 612
Geology, agricultural, 313
Geological Observer, rev., 646
Geraniums at sea, 55 ; fancy select, 72 ; scarlet, 807
Gladioli, select, 759
Glass, uses of, 38 ; rough plate, 38, 263, 390, 406, 758, 773 ; quarry, 695 ; horticultural, 741
Glass walls, 757, 771, 790
Glass water pipes, 355
Glass houses, to erect, 180 ; to move the air in, 182 ; ventilation of, 184, 327 ; ridge and furrow, 310 ; shading for, 373 ; winter covering for, 756, 773.
Glazing, new mode of, 437
Glycine in China, 340, 343
Goodsir's Arctic Voyage, rev., 23

Gooseberries, 552; prize, 70; for succession, 792; to keep birds from, 806
Gooseberry trees, 83
Gorse, 717; and Fern, to transplant, 200
Gorteria rigens, 390
Grafting, 3, 504; history and utility of, 4; affinity of grafts and stocks, 21; analysis of kinds of, 37; inarching, observations on, 37; ditto on stems and branches, 37, 53; ditto hymeneal and sylvain, 53, 69; ditto small plants on large stocks, 69; cleft, observations on, 85; ditto with one scion and the stock cut sloping, 101; with single and double scions, and with stock of scion of equal size, 117; English cleft, 133; cleft in the side of young stems, branches, and shoots of the same size as the scion, 133; crown, observations on, 148; budding, observations on, 166; ditto with pushing eye, 180; ditto with dormant eyes, 196; with the shield removed without alburnum, 196; with the shield placed in an opening made in the form of a T reversed (⊥), 196; ditto square stamped out shield of, 212; tubular, 212; ditto with shooting eyes, 212; ditto with dormant eyes, 212; Cacti, 22, 70; Vines, 104; peg, 152; plants, 501
Grain, harvesting and preserving, 589
Grapes, shows of, 87; scissors for, 87; summer treatment of, in greenhouses, 214; rust in, 360; quick growing, 662; effect of airing well, 694; Josling's St. Alban's, 758; Reeve's Muscadine, 808
Grape mildew, 438, 469, 547, 551, 628, 643, 644, 707
Grass by inoculation, 189; to lay down for permanent pasture, 204, 205, 813; sheep on, 283; Doab, of India, 597; Pampas (Gynerium argenteum), 757
Grass seeds, 39, 141, 174, 205, 523; Italian Rye, to sow, 750
Grass land, 72; not to be broken up, 252; management of, in Fifeshire, 426
Greenhouses, how to smoke effectually, 38, 70; galvanised iron, 198; model of a, 215; summer treatment of Vines in, 214; in the Crystal Palace, 499; climbers for, 680; plants, to expose, 550, 566.
Groom's (Mr.), nursery, 103
Grubber, Scoular's improved, 53; Tennant's, 461; description of a new subsoil, 475
Guano, experiments with, 13; Norwood (loam), 246; trade, 72, 169, 243, 267, 284, 300, 451, 467, 491, 508, 547; new source of, 349; Australian, 380, 686; analysis of ditto, 381, 761; and charcoal, 468; adulteration of, 490, 589; Bolivian, analysis of, 510; normal, 508; Mr. Alcock's motion respecting, 467, 649; frauds, 825
Gutta percha, 376; piping, 6
Gynerium argenteum, 757
Gypsum, influence of, 164, 165; limestone, to convert into, 93; Prof. Way's Lecture on the employment of, in agriculture, 412; advantages of, 446

H

Hair manure, 650
Harrows in the Crystal Palace, 315, 364
Harvest in South Hants, 571
Harvesting grain, best method of, 589; root crops, 714
Harvesting machines in the Crystal Palace, 377; Hashish, 616
Haymaking, 445; time of cutting, 621; treatment in the field, 621; management of the rick, 621
Heat of plants, 375
Heating, 6, 22; cement tanks for, 166; Polmaise, 326; stove for ditto, 628; Grant on, 328; by waste steam, 403; by hot water pipes, 742
Heaths, to dry, 248
Hedera Rægneriana, 597, 661
Hedges, Yew, 358
Hemp, Chevalier Claussen's communication on, in favour of an extended cultivation of, 107, 123, 155, 410
Henderson's (Messrs.) nursery noticed, 71
Hens, singing, 790
Hepaticas, 152, 182; hybridising of, 86
Herbaceum giganteum, 70, 710; sphondylium, 428

Oat husks, analysis of, 109
Obituary, Mr. Wilmot, 23; Mr. Christie, 71; Sir Francis Lawley, 92; M. Wahlenberg, 263; Dr. Kunze, 328; Dr. Neill, 567, 663; Mr. Cunningham, 695
Odontoglossum Bictonense, 660; cordatum, 660; maculatum, 660; pulchellum, 660; Rossii, 660; Insleayii, 660; Egertonianum, 660; leucochilum, 677; Cervantesii, 677; membranaceum, 677; grande and citrosmum, 693
Oil, linseed, as a cure for scale, 453
Oncidium leucochilum, 467; sphacelatum (grandiflorum), 467; ampliatum (majus), 467; ornithorhynchum, 467; incurvum, 467; guttatum, 467; Barkeri, 467; bicallosum, 467; ciliatum and concolor, 581; Lanceanum, 645; flexuosum, 645; flexuosum majus, 645; bifolium, 645; longifolium, 645; unguiculatum, 660
Onions, 53, 293; and celery, 582; winter, 645, 661; select, 725; Potato, 805
Onion fungus, 595, 646
Orache, 51
Orange trees, substitute for, 131; Bermuda, 339; French, 503
Orchard houses, 35, 216; Rivers on, rev., 35; temperature of, 518
Orchards, preparing ground for, 693, 726
Orchard trees, effects of sea weed upon roots of, 214
Orchids, 469; sale of, 232, 263, 343, 359, 375, 391, 453, 647, 792, 808; European, 309, 693; for the million, 324, 340, 356, 389, 404, 406, 421, 437, 467, 483, 500, 517, 532, 549, 564, 580, 595, 611, 645, 660, 677, 693, 756; shows, 325, 389; Dr. Wight's, rev., 535; terrestrial, 309, 693; at Chiswick, 740; blocks of, 774; Mr. Rucker's, 776
Osiers, 62
Ostrich, the, 789, 821
Oxalis Bowei, 39
Oxford Botanic Gardens, new houses, &c., in, 744
Oxide of iron, action of, on vegetation, 299
Oxide of manganese, action of, on vegetation, 299
Ox tribe, Vasey on the delineations of, 429

P.

Pæonies, to propagate, 119; tree, 356
Paint for timber, 39; cheap and durable for farm buildings, 170, 187; for inside walls, 318; Fleming's tar for iron, 405, 421, 437, 453, 485, 502, 518; for out-door woodwork, 558
Pampas Grass (Gynerium argenteum), 757
Panama, eatable plants of, 599; candle tree of, 728; Cedron tree of, 791; ornamental trees of, 790
Pansies, seedling, 679
Paris, gardens round, 437; horticultural show at, 662; price of corn at, 829
Parrots, 822; diseases in, 438, 454, 469
Parsley, 68
Parsnips, 198; cow, 428; culture of, 650
Pastures, hints on laying down permanent, 140, 813; improving old, 140; Grass seeds for, 813
Paul's (Messrs.) nursery noticed, 455; their new Roses, 518, 535, 550
Paul (Mr.) on Roses in pots, rev., 391
Paulownia imperialis, 519, 630; flower-buds of, 822
Paxton, Sir Joseph, 755
Payer on Cryptogams, rev., 183
Peaches, to force, 118, 405, 437; retarded, 678
Peach trees, to root prune, 376; blight of, 486

Pear trees, for a sea-side garden, 24; to train, 21; to protect, 38; deformed, 99; late, 104; for espaliers, 120, 648; and frost, 373; ringing, 632
Pear shaped weevils, 229, 261
Pear tree astyages, 357, 373, 390
Peas, early, 72, 100; late, 56, 72; winter, 358; green winter, 390; shells of, 387; skinless, 455; new, 519; culture of, 603; to keep from mice, 648; select, 725
Pea mildew, 227, 467
Peat, value of, 84
Peat charcoal, 12, 84, 132, 150, 231, 238, 459, 518, 589, 621, 713, 733, 811; Rogers' patent for making ditto and fuel, 231; preparation of, 268; to make, 397, 428, 509; chemical products of, 535; charred, to winter Potatoes in, 611
Peat ashes, as manure, 491
Pelargoniums, growers of, 244; fancy select, 72; new, 375; select, 726; Cape ditto, 536; scarlet, 897
Penny savings' banks, 278, 310, 358
Peristeria elata, 500
Peruvian guano trade, 72, 169, 213, 267, 284, 300, 451, 467, 491, 508, 547
Phaius albus, 517; Wallichii and grandifolius, 532
Phalænopsis grandiflora and amabilis, 549
Phillips' fire annihilator, 231, 723, 773
Phloxes, to hybridise, 342
Phosphate of lime, American, 539, 555
Phosphate nodules, 764
Picotee seeds, 453; show of, 502
Pigs, 684; cure for scour in, 382; ditto in young, 366; to fatten, 411; Berkshire, 491; carcase and living weights of, 523
Pine-apples, bottom-heat for, 40; standard weights of, 405; Black Jamaica, 422; history of, 695
Pinguedo, as manure, 716, 811; analysis of ditto, 716
Pink showing, 485; select, 679; culture of, 679
Pineries, span-roofed, 252
Pinuses, rate of growth in, 214, 230, 240, 246, 262, 534
Pit, forcing, 134
Planchon's (Dr.), appointment, 759
Plane tree timber, 725, 757, 805
Plants, aquatic, 5, 147, 197, 280, 310, 420, 469, 485, 501, 502, 517, 536, 614; stove ditto, 197, 214, 215, 230; depth of water for ditto, 502; ditto for a pond, 728; effect of locality on, 22; and animals, difference between, 28, 515; nourishing fluid of ditto, 28; washing, 35; collecting British, 39; absorption of nitrogen by, 52, 88, 739; thawing frozen, 53; mulling among, 55; sea-side, 55; perspiration of, 67; wall, 72, 407; Robin on the Reproductive Organs of, rev., 103; effects of putrifying matter on, 116; buying, 134; vinegar, 136; spring flowering, 182, 199; spurring hard-wooded, 197; cells of, 772; ditto, composition of the walls of, 199; hardy, 214; for "Crystal Palace," 211; in ditto, 295; cellular tissue of, 227; roots of, 243; rock, 248; microscopic examinations of, 260; for shade, 280; to dry, 188, 350, 405; to keep mould from ditto, 136, 392; names of, 209, 739; old ditto, 502; to acclimatise, 341; American, Mr. Waterer's exhibition of, 359; heat of, 375; hop, 398; and the atmosphere, 403, 419; variegated, 423; in dwelling-houses, 424; growth of, in various gases, 468; periodic phenomena of, 484; grafted, 501; descent of sap in, 516; summer treatment of, 553; greenhouse, to expose, 550, 566; direction taken by, 567; eatable of Panama, 599; flower-garden, 645; inclosed in coal-pits, 694, 742; bedding, 710; naming, 739; effect of frost on, 789; old esculent, 791
Plant houses, to erect, 180; to move the air in, 182; ventilation of, 184, 327; ridge and furrow, 310; shading for, 373; winter covering for, 756, 773
Plant sales, 135, 232, 263, 324, 343, 359, 375, 391, 453, 647, 696, 792, 808
Planting, forest trees, 326; ditto on waste land, 86; preparing ground for ditto, 724; style in, 101; shrubberies, effective, 675; quick, 741; fruit trees, 741
Plantations, young, 293; Larch, 387
Plantains, Mexican, 563
Ploughs, new subsoil, 221; in the Crystal Palace, 297, 314, 330; steam, 665; and spades, 829
Plumbago Larpentæ, 694, 710
Plums, 277; for a sea-side garden, 24; Reine Claude de Bavay, 213; to train, 213; to bud, 406; late, 695; Coe's Golden Crop, 710, 726, 742
Poisons, 29
Poisoning by mushrooms, 675, 772
Poinsettia pulcherrima, 22
Pollard tree, artificial, 102
Polmaise heating, 326; stove for, 628
Polyactis fasciculatis, 707
Ponds, green, 534; aquatics for, 728
Portugal Laurels, standard, 131
Potatoes, 518, 614, 636; early, 20, 152; to protect ditto, 430; diseased, 70; varieties of, 71; Jackson's Kidney, 71; baked, quantity sold in the metropolis, 263; seed, 342; to cook, 358; in New Zealand, 486; German, 381; waxy, 550, 566; Cuthill's plan of wintering, 533, 550, 582; to store, 550, 597; culture of, 597; early planted, 661; to keep in charred peat, 661; in Kent, 668; prolific, 741; long stalk of, 749; in Perthshire, 753; manure for, 778, 811; and emigration, 826
Potato disease, 373, 390, 422, 452, 453, 469, 501, 518, 521, 531, 551, 566, 611, 629, 759; Prof. Mitscherlich's observations on, 199; in Ireland, 518, 531; in Germany, 599
Potato crop, 634; in Ireland, 570, 588
Pots, Carnations in, 166; Vines in, 293, 725; late Plums in, 695
Poultry, 43, 44, 91, 105, 123, 171, 236, 345, 445, 509, 523, 588, 604, 606; houses and walks, 27, 44; to pinion, 60, 218; Richardson on, 173; breeding and rearing, 28, 250, 586; Boswell on, 471; pilgrimages, 618; disease, 667, 716; Birmingham show of, 286, 701, 766; report of ditto, 827; Yard (Knight's), rev., 807; cramp in, 782; Baily on Dorking, 284; to mark, 444, 459; Cochin China, 526; food for young, 285
Poulterer's Companion, Bement's American, rev., 236
Preserving timber, 3, 54, 86; eggs, 141; Cauliflowers, 247; fruit, 355, 390, 616; animal and vegetable substances, 552; grain, best method of, 589; filberts, 616
Prices of goods in 1810 and those in 1851, 667
Primula, Chinese, 215
Prince Albert's portrait, 711
Promenæa stapelioides, 517
Pruning, hedgerow trees, 284; Peach trees, 376; summer, 456; forest trees, 516, 532, 566, 596, 614, 630, 708, 758, 788, 805; Wistarias, 712; fruit trees, 806
Pumps, centrifugal, in the Crystal Palace, 570
Pusey's (Mr.), speech, 89, 171; on farming, rev., 140; Liebig's critique on, 443

Q.

Quercus aquifolia, 311
Quick, to plant, 741

R.

Rabbits, management of, 60; on open-boarded floors, 171; to keep from barking trees, 342, 343
Radishes, horse and winter, 53
Railroads, farm, 349; Mr. Neilson's, 186
Railway Literature (Murray's), rev., 679, 743, 823
Rain, at Witham and Arundel, 22; at Cirencester, 28; at Bognor and Carlesgill, 55; at Goodamoor and Cobham, 71; at London, Ham, and Broadenburg, 87; at Pembroke, 102, 199; at Thurston, near Dunbar, 134; at Bowness, 199; at Itchen Abbot, 214
Rambles in New South Wales, rev., 6
Ranunculuses, 341; select, 24
Rape, 571; utility of an early crop of, and the best means of obtaining it, 445; culture of, 475; to sow, 750
Rape cake, as manure, 505
Raspberries, ripe in January, 55; vitality of seeds of, 515, 549, 565; double bearing, 694
Rats, 189, 204; to kill, 597
Reaping machine, 604, 621; American, 538, 553, 554, 585, 606, 700, 717, 747, 749, 781; Garrett's, 555
Reed on the Steam Engine, rev., 487
Rent, reduction of, 12; payment of, 252
Reviews, miscellaneous, 503
Rhododendrons, 406; Himalayan, 645; of Sikkim Himalaya, by Dr. Hooker, rev., 163, 787; Aucklandi, Thomsoni, pendulum, pumilum, lanatum, glaucum, Maddeni, and triflorum, 163; hybrid, 197; large, 231; at Upton House, 279; scarlet, 293; arboreum, 326; to hybridise, 342; sale of, 696; javanicum, 758; Edgworthii, Dalhousieanum, æruginosum, fulgens, nivale, 787
Rhubarb, 100; Mitchell's Prince Albert, 118; to force, 134; to cook, 135; to protect, 230
Ribston Pippin Apple, 614, 629
Rivers' (Mr.) Orchard Houses, rev., 35
Robin, on the Reproductive Organs of Plants, noticed, 103
Robin, audacity of, 822
Rockwork, to colour, 214; plants for, 248
Rod and the Line, by Wheatley, rev., 695
Rollisson's nursery, noticed, 662
Rocks, habits of, 629, 646
Rookery, establishing a, 150
Roses, continuous bloomers, 5, 22, 70; catalogues of, 6; Ma-au-ga, 55; autumn, 168; spurring of, 197; for forcing, 279; Cloth of Gold, 310, 358, 566, 613; Tea, 326; yellow, at the Chiswick Exhibition, 391, 405, 422; Paul's pamphlet on, 391; new, 439; Lane's noticed, 439; Paul's noticed, 455; at Regent's Park, 455; old double yellow, 550; for exhibition, 676; yellow, climbing, 728; late, 773

Statistics of Ireland, 537; agricultural, 668
Steam, heating by waste, 403; cultivator, 393, 665, 686; farming, 762
Steam engine, 204; flue boilers to, 60, 154; in crustations in boilers of, 327; management of, 249, 283; in the Crystal Palace, 490
Reid on, rev., 487
Stock, Dickson, on breeding of, rev., 13; linseed as food for, 28; Beans as, 61; early spring, 253; best method of storing Turnips for, 61; hides of, 73; qualities of ditto, 106, on boarded floors, 154, 682, 748; short-horned, 173; use of salt in food of, 187; to feed, 109; 221, 348, 444, 590, 602; report of, at the Agricultural Society's meeting, 459, 475, 492; analysis of the exhibition of, at ditto, 461; ditto, from 1847 to 1851, 476; fat and imperfect, at ditto, 572; Eyton's herd book of Hereford, rev., 461; West Highland, 523; show of, at Birmingham, 286, 701, 812, 825, 827; report of ditto, 797; Smithfield, 28; report of ditto, 796, 811, 825; marketing of, 602; clipping of, 748; feeding of, 590, 829
Stocks, 213, 712
Stone, cement for, 599
Stove, plan of a cottage, 454, 518
Stratton's (Mr.) appointment to the Cambridge Botanic Gardens, 71
Straw, for plaiting, 797
Strawberries, 149, 454; to force, 358; early and late, 440; culture of, 534; Beach's ditto, 485; classification of, 648; new, 740, 757, 789, 804
Subsoil, 777; plough, 221; in the Crystal Palace, 330; grubber, description of a new, 475
Suffolk Agricultural Relief Association, 621
Sugar, books on, 168; Beet, 329, 332, 521, 539, 571, 620; in animals, 323, 587, 601; refiners' refuse of, as manure, 650
Sulphurator, Epps's, 468
Superphosphate of lime, 180, 382; to apply, 216, 280; adulteration and detection, 621
Sutton's (Messrs.) nursery noticed, 279

Swallows, 501
Swedes and Mangold Wurzel, 539
Swedish botanical gardens, 307
Sweet-williams, monstrous, 550
Swifts in Yorkshire, 566, 597
Syringes, garden, 565

T.

Tacsonia mollissima, 6
Tanks, lead, 38; cement for, 166; material for, 376; liquid manure, 622
Tar paint, Fleming's, 405, 421, 437, 453, 485, 502, 515
Tares, winter, 633; to sow ditto, 574; and Vetches, 563
Tarts, fruit, 551
Taxation, 219
Tea culture, in India, 339
Temperance, 604, 668
Temperature, 569, 697; high winter, 38; Chiswick v. Holkham, 118; in-door v. out-door, 246; Grant, on regulating, 328; of orchard houses, 518
Thatch, incombustible, 253; v. permanent shelter, 299
Thermometers, to place, 408
Thibet, botanical geography of part of the, and western, 612
Thin seeding, 9, 10, 171, 734
Thistles, 621
Thorn, scarlet, 613
Threshing machines, 398; in the Crystal Palace, 394
Thrush, performances of a, 742
Tiles, draining, 284; kiln for, 410
Timber, preservatives of, 3, 54, 86, 580, 820; paint for, 39; to season, 102; ripening, 120; trees, 134, 150, 261; Spanish Chestnut, 182, 198, 211, 214, 230, 262; old, to renovate, 262, Van Diemen's Land, 275, 276, 291, 307; durability of, 342; Plane tree, 725, 737, 805; effect of soil on, 806
Tithe commutation, 27
Toad, poisonous qualities of, 325; in flint, 534
Tobacco, Guatemala, 248; Irish, 587
Tomato sauce, to make, 632
Torenia asiatica, 134
Torquay, climate of, 391, 406
Tours, agricultural, 61; Mr. Mechi's, to North Devon, 73, 90
Townshend's Rambles in N. S. Wales., rev., 6
Trade memoranda, 117, 133, 166, 197, 213, 245, 389, 421
Transplanting, 536; trees, 19; theory of, 179; Gorse and Fern, 200; in autumn, 246; evergreens, 630; Asparagus, 712
Traps, beetle, 689
Traveller, notes of a, 5, 228, 340
Traveller's Library (Longman's), rev., 679
Trees, gigantic, fossil, 24; to transplant, 19; Fir, 39; twigs of ditto eaten by squirrels, 182, 198, 213; precocious, 518; forest, to plant, 326, 724; ditto, waste lands with, 86; reinvigorating old ditto, 87, 293; pruning ditto, 516, 532, 566, 596, 614, 630, 708, 758, 788, 805, 822; ditto in Scotland, 692; ditto and underwood, 694; pollard, artificial, 102; in the Crystal Palace, 99, 133, 707; Beech, 118; bleeding in ditto, 740; ditto on an Oak, 757; for timber, 134, 150, 261; preservatives of ditto, 3, 54, 86, 580; seasoning of ditto, 102; ripening ditto, 120; Spanish Chestnut as ditto, 182, 198, 211, 214, 230, 262; old, to renovate, 262; durability of, 342; Blue Gum (Eucalyptus globulus), 275; hedgerow, 316, 640; pruning ditto, 284; to keep rabbits from barking, 342, 343; to withstand the sea breeze, 472; law of overhanging, 483; formation of wood in, 516, 708; Maiden Hair, 614, 646, 661; Conifer, varieties of, 150; ditto and cattle, 214; sizes of ditto, 214, 230, 246, 262, 534, 630; names of ditto, 774; Judas, to remove, 648; Oak, law relating to, 168; Turkey, ditto, 230, 246; Parliament ditto, 519; meaning of Dunmast, 677; road-side, 711; leaves of, 742, 757; Panama, 790; candle, 728; Cedron, 791; fruit, for a sea-side garden, 24; Pears, to train, 21; to protect ditto, 38, 56; deformed ditto, 99; late ditto, 104; ditto for espaliers, 120, 648; ditto and frost, 373; ringing of ditto, 632; Gooseberry and Currant, 83; ditto disbudded by birds, 438, 806, for succession, 792; Peaches, to force, 118, 405, 437; to root prune ditto, 376; blight of ditto, 486; retarded ditto, 678, 694; Orange, substitute for, 131; Bermuda ditto, 339; French ditto, 503; Rivers' orchard houses for the cultivation of, rev., 35; for a south east aspect, 120; Cherries, to train, 213; ditto, for marketing and succession, 120; Morello ditto, 259; to bud ditto, 406; retarded ditto, 678, 694, for an east wall, 200; to cover ditto, 309; Plums, 277; to train ditto, 213; Reine Claude de Bavay ditto, 213; to bud ditto, 695; Coe's Golden Drop ditto, 710, 726, 742; for a south-west aspect, 216; Apple, Belleheim Orange, 228; Normandy Pippin ditto, 314; ditto singular bloom of, 406; Ribston Pippin ditto, 614, 629; Redstreak ditto, 614; ditto for espaliers, 648; table ditto, 808; kitchen ditto, 808; sea-weed for, 214; summer pruning of, 456; Apricot disease, 664; ringing, 680; Fig, late, 694, 709, 725; double digging ground intended for, 726; planting of, 741; for an east aspect wall, a northern part, 776; pruning young, 806
Trenching, 121
Trentham, standard Portugal Laurels at, 131; machine for killing weeds on walks at, 275, 357, 372, 390, 452, 533
Trichophila tortilis, 500
Tropæolum tuberosum, 214
Tropical forests in British India, physical and economical effects of the destruction of, 548
Trout Fishing, Pulman on, rev., 711
Tuberoses, 392
Tubers and bulbs, classification of, 423
Tullian culture of land, 138, 141, 153, 186, 236, 267, 282, 348, 362
Tulips, 711; early, 70, 86; Mr. Groom's, 327; amateurs', show of, 359; to plant, 695; ditto, offsets, 583; breaking, 743
Turkeys, breeding and rearing of, 586
Turner on Training Horses, 622
Turner's (Mr.) nursery noticed, 295, 407
Turnips, manures for, 11, 75, 365; best method of storing for spring feeding of cattle, 61; early, 53; and Mangold Wurzel, 316, 445; culture of, 389, 439, 635; to sow, 364; green caterpillar, flies and slugs on, to destroy, 555
Turnip crop and drainage, 173
Turnip cutters in the Crystal Palace, 395, 426
Turnip moths, 473, 484, 489, 491, 499, 503, 523, 555, 650
Tussac Grass, 23

U.

United States, horticultural meetings, 23; gardening in, 88; Wheat soils of, 413; phosphate of lime of, 539, 555; reaping machines of, 538, 553, 554, 585, 646, 709, 717, 747, 749, 781; Daily on, rev., 551; Victoria regia in, 743

V.

Vanda teres, 549; cristata, suavis, tricolor, 612
Van Diemen's Land, blue gum tree of (Eucalyptus globulus), 276; timber of, at the Crystal-palace, 275, 276, 291, 307
Vasey, on the Delineations of the Ox Tribe, rev., 429
Vegetables, to earth up, 54; to dry, 183; for exposed gardens, 72; Masson, on preparing, 359; improvement of, 378; for different soils, 440; to preserve, 552; shows, 748
Vegetable and animal life, 515
Vegetable Marrows, 520
Vegetation of Auckland Islands, 103; researches in, 147, 148; influence of gypsum on, 164, 165; action of fine earthy matter on, 282, 299; chemistry of, 643; Himalayan, 646; of Borneo, 695; theory of, 741
Vegetarians, 604
Veitch's (Messrs.) nursery, 579
Ventilation of glass houses, 184, 327; of stables, 780; of public buildings, 781

Vetches and Tares, 363
Victoria regia, 182, 420, 485, 501; name of, 7; houses, 19; at Messrs. Veitch's, 167; at Messrs. Knight and Perry's, 215, 407; at Messrs. Weeks', 199, 327, 439, 700; scent of, 549; at Hamburgh, 728; in United States, 743; in Calcutta Botanic Garden, 805
Vienna, shooting near, 792
Villa and suburban gardening, 5, 21, 37, 68, 104, 180, 213
Village lectures, 42; education, 278; clubs, 411; Eydon industrial ditto, 765; excursions, 587
Vinegar plant, 136
Vines, culture of, 6; cure for bleeding in, 22; out door, 38, 70; to graft, 104; summer treatment of, in greenhouses, 214; for succession, 248; in pots, 293, 725, 822; Sanders on, rev., 327; management of, 803, 805, 819
Vinery, Vacca, 744, 789
Vine mildew, 438, 469, 547, 551, 628, 643, 644, 707
Vine borders, 792; to cover, 54, 165
Vine leaves, scorching of, from dryness of the air, from condensation, 803, 819
Viola lutea, 422
Violets, 485
Viper bite, cure for, 398
Vitality of seeds, 70, 515, 533, 549, 565, 597

W.

Wages of gardeners, 136, 216; of labourers, 617
Wagnorn, Lieutenant, 54
Wahlenberg, death of, 263
Walks, edgings for, 38 70, 86; flower garden, to make, 245, 518, 534, 550; Fleming's machine for killing weeds on, 275, 357, 372, 390, 452, 533; to salt, 391, 406, 452, 484, 502, 517; quantity of ditto to apply to a gallon of water, 520; asphalte, 501, 659; tarred, 677, 678, 694, 822; lead refuse, 694
Walls, east, fruit trees for, 200; to cover, 309; to stud, 230, 246, 278; paint for inside, 318; Ivy on exterior, 712, 725; ditto on brick, 742; glass, 755, 771, 790; fruit trees for an east aspect, in a northern part of, 776; meaning of different aspects explained, 776
Wall plants, 72, 407
Wall fruit, 579
Wallflower, common, monstrosity of, 564
Ward's World and its Workshops, 598
Warnes' on Flax v. Cotton, rev., 205
Water, gutta percha piping for conveyance of, 6, 247; glass, 355; syringing with cold, a remedy against the effects of frost, 6; quantity running from main drains, 205; London, 259, 371; gardens to, 438, 469; depth of, for aquatics, 592; Canna, to grow in, 551
Water filters, Price and Whitehead's, 247
Water pipes, glass, 355; gutta percha, 6, 247
Water plants, 5, 147, 197, 199, 280, 310, 420, 469, 485, 501, 502, 517, 536, 614; depth of water for, 502; tender, 197, 214, 215, 230; for a pond, 728
Water-cresses, 165
Water-butts, Conferva in, 120; to remove ditto, 166
Waterer's (Mr.) Exhibition of American plants, 359
Waterproofing composition, 104, 184
Way's (Prof.) lectures on the use of common salt in agriculture, 365; on employment of gypsum in, 412; of lime in, 540, 589
Weald of Kent, Sussex, and Surrey, improvement of, 217
Weather, 789; at Dorchester, 14, 29, 45, 61, 77, 93, 125, 140, 173, 189, 205, 221, 237, 253, 269, 285, 301, 317, 333, 349, 366, 381, 413, 429, 461 478, 494, 502, 526, 542, 558, 574, 590, 606, 622, 638 653, 670, 686, 718, 734, 749, 766, 781, 798, 814, 830; at Pembroke, 102; mildness of the, 71, 87, 102, 122, 135, 150, 166; wet Marches, 245; the equinoxes, 379; at Warrington, 725; in the far north, 741; at Norfolk, 758
Weeds, 595, 614, 755; and manure heaps, 116, Fleming's machine for killing, 275, 357, 372, 390, 452, 533; on walks, to salt, 391, 406, 452, 484, 502, 517, 518; quantity of salt to apply to a gallon of water for killing of, on ditto, 520; burned, as manure, 716; on lawns, 788
Weevils, Pear shaped, 229, 261
Wexford, Bean culture in, 10; crops of, 603
Wheat soils, 41; ditto of America, 413; blight in, 92; sheep on, 204; in beds and alleys, 348; Tullian growth of, 348; black, 364; stacks, covering for, 395; April, 557; to dibble, 571; produce of, on good and inferior land, 589; expenses and returns of an acre of, 601; price and yield of, in South Hants, 668; prices of, in England, France, and Belgium, for the five preceding years, 715; growing, 745; Ward on ditto, 775; price of, in 1202 and 1851, 779; before Barley, 827
Whitewash, to make, 376
Widow bird, 8, 24
Wight's (Dr.) Orchids, rev., 534
Willich's tithe commutation table, 27
Wilmot (Mr.), death of, 23
Winds, Trade, Ehrenberg on the Dust deposited by, rev., 151
Wine, Berberry, to make, 197
Winter temperatures, 38; gardening, 38; gardens, 19, 70; Crystal Palace as ditto, 419, 438, 458; Mr. Paxton's pamphlet on ditto, 421; ditto, his letter to Lord Campbell on, 453; Smithfield as ditto, 531; Carrots, 645, 661; Onions, 645, 661; Flax, 668; Tares, 683; to sow ditto, 574; scorching of Vine leaves during, 803, 819
Wire-worm, to destroy, 134, 150, 376; to clear from leaf-mould, 24
Wistaria sinensis, 340, 343
Wood, preservatives of, 3, 54, 86; ripening of, 120; paint for, 39; to season, 102; Turkey, 230; bark, 230; coppice, 309; formation of, 516, 708
Wood-lice, to kill, 277
Word in Season, or pamphlet on corn growing, rev., 669, 698, 745
Wrench's samples of seed, 634, 646, 669, 677

Y.

Yeast, bitterness of, to remove, 781, 814
Yew hedges, 358
Yorkshire, swifts and hornets in, 566
Young's (Mr.), nursery noticed, 775

MESSRS. J. AND J. FRASER'S PRICED CATALOGUE OF STOVE AND GREENHOUSE PLANTS is ready, and will be forwarded, gratis, to all applications. They also beg to observe that most of the fine specimens shown at the Chiswick and Royal Botanic Exhibitions are grown from plants supplied from their collection. The great attention paid to the plants while in a young state (without which they never make good specimens) renders this Nursery a most desirable market for purchasers.—Lea-bridge-road, Essex, Jan. 4.

TO GARDENERS, FLORISTS, AND SEEDSMEN.

CLASSIFIED CATALOGUES OF 800 GARDEN, FLOWER, and other SEEDS for 1851; with time of Sowing, &c, may be had of TAYLOR and TABBERER, Printers, &c., East-street, Brighton; in demy folio, 2 pages, at 1*l.* 5*s.* per 1000; 15*s.* per 500; or 2*l.* 2*s.* per 2000. Carriage free to London, including name and address of any gardener, &c., requiring them. Specimen copies sent on receipt of 1*d.* stamp.

CARTER'S CATALOGUE OF SEEDS.

J. CARTER, SEEDSMAN and FLORIST, 238, High Holborn, London, announces the appearance of his new CATALOGUE FOR 1851, which will be forwarded, gratis and prepaid, on application by post or otherwise. He begs leave to state that the Floricultural section comprises, as usual, the Scientific and English Name of each plant, the Linnean Class and Order, and Natural Order to which it belongs; its hardiness, duration, time of flowering, and colour of the flowers, and other necessary information. The collection of Flower Seeds will comprise several splendid novelties.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.
January 4.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

NEW EARLY PEAS, &c.

BASS AND BROWN have a very fine Stock of the undermentioned early Seeds, which they are enabled to offer at the following low prices:—

| | Per quart.—*s.* *d.* |
|---|---|
| PEAS, Taylor's new Prolific, very early, hardy, and productive, sent out by Barnes ... ... ... ... | 1 6 |
| Essex Champion, hardy and very productive ... ... | 0 8 |
| Dancroft Rival, very early ... ... ... ... | 1 3 |
| Bishop's new Long-pod, great bearer ... ... ... | 1 0 |
| Early Warwick, Early Frame ... ... ... ... | 0 6 |
| Early Emperor, very early and hardy ... ... ... | 0 10 |
| Fairbeard's Champion of England ... ... ... | 1 0 |
| BEANS, Long-pod and Windsor ... ... ... ... | 0 6 |
| RADISH, early Short top Salmon ... ... ... ... | 1 6 |
| Wood's new early Scarlet ... ... ... ... ... | 2 0 |

Their Wholesale List of Prices of the above and all other description of Seeds will be forwarded on application.
Seed and Horticultural Establishment, Sudbury, Suffolk.

KNIGHT AND PERRY, EXOTIC NURSERY, King's-road, Chelsea, London, deeply grateful for the distinguished patronage so long conferred upon them, beg to intimate that their NEW CULINARY AND FLOWER SEEDS, all of the first quality, are now ready, and they most respectfully solicit a continuance of that support which has been extended to their house for the last 50 years.

For the above—as well as for their AGRICULTURAL SEEDS, to which they pay great attention, Stove, Greenhouse, and Herbaceous Plants, Bulbous Roots, imported annually by themselves from Holland, Conifers and other Hardy Ornamental Trees and Shrubs in great variety, and including many valuable novelties, Grape Vines of all the best sorts, from eyes, Fruit Trees of choice sorts, both trained and untrained, and which are this season of very fine growth—there are lists specially appropriated, and which they respectfully solicit permission to forward.
Exotic Nursery, King's-road, Chelsea, London.

GARDENERS AND OTHERS having any quantity of CHOICE CUT FLOWERS, can meet with a purchaser by applying to Mr. SLAYMAKER, Centre Row, Covent-garden Market.

N.B.—Bouquets made of the choicest Flowers for Wedding and other Parties, and sent to all parts of the kingdom.

J. G. WAITE'S CATALOGUE OF VEGETABLE SEEDS is now Ready, with Prices to suit the times, and can be had on application.
181, High Holborn, London.

J. G. WAITE'S CATALOGUE OF FLOWER SEEDS is also Ready, and can be had on application.
181, High Holborn, London.

SION-HOUSE DWARF FRENCH BEAN, new, early, buff speckled. This is the earliest Bean known, and can be had in any quantity, price 21*s.* per bushel.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London, where every other kind of Seed in cultivation can be had, on better terms than at any other House in the Trade.

RHUBARB ROOTS TRUE TO NAME.—Myatt's Victoria, 6*s.* per doz.; Myatt's Linnæus, 9*s.* per doz.; Mitchell's Albert, 9*s.* per doz.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

STRAWBERRY PLANTS.—Kitley's Goliah, 10*s.* per 100; Myatt's Eleanor, 4*s.* per 100.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

NEW GIANT ASPARAGUS PLANTS, 5*s.* per 100.
LARGE GIANT SEAKALE PLANTS, 8*s.* per 100.
At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

MESSRS. STANDISH AND NOBLE have to offer the following very desirable plants:

AZALEA INDICA, "GLORY OF SUNNING-HILL."—In general appearance this plant, when in bloom, reminds one of Nerium splendens, producing large double rose-like flowers of the richest pink; good plants, 3*s.* 6*d.* to 10*s.* 6*d.* each.

CRYPTOMERIA JAPONICA SEEDLINGS.

| | |
|---|---|
| 2 years ... ... ... ... | 18*s.* per doz., or 105*s.* per 100. |
| 3 years ... ... ... ... | 30*s.* „ 210*s.* „ |
| 1 foot 6 inches to 2 feet 6 inches high, | 60*s.* per dozen. |
| 2 feet 6 inches to 3 feet 6 inches high, | 90*s.* „ |
| 3 feet 6 inches to 4 feet 6 inches high, | 126*s.* „ |

And larger plants in proportion.
The whole of the above, with the exception of the two years seedlings, were planted into the open border last spring, are fine robust specimens, and fit for immediate planting.

CRYPTOMERIA JAPONICA, var. NANA, a very singular dwarf variety, 10*s.* 6*d.* to 21*s.*

CUPRESSUS FUNEBRIS, or WEEPING CYPRESS. (North of China.)
6 inches high, 10*s.* 6*d.* each; 12 to 15 inches, 21*s.* each.
These plants are from the open border—robust specimens fit for immediate planting.
15 ins. to 24 ins., 31*s.* 6*d.* each; 24 ins. to 30 ins., 42*s.* each.

CUPRESSUS GOVENIANA. (California.)
6 to 9 inches, 7*s.* 6*d.* each; 9 to 15 inches, 10*s.* 6*d.* each.
15 to 24 inches, 21*s.* each; 2 to 3 feet, 31*s.* 6*d.*

CUPRESSUS LAMBERTIANA, 2 feet, 3*s.* 6*d.* each.

CUPRESSUS THURIFERA, var. ELEGANS, perfectly hardy. 1 foot to 2 feet high, 3*s.* 6*d.* to 5*s.* each.

CEPHALOTAXUS FORTUNII, strong plants, 31*s.* 6*d.* each. For description, see "Botanical Magazine," by Sir W. Hooker.

FORSYTHIA VIRIDISSIMA.

| | |
|---|---|
| 1 foot 6 inches to 2 feet ... ... | 1*s.* 6*d.* to 2*s.* 0*d.* each. |
| 2 feet to 3 feet ... ... ... | „ 2*s.* 6*d.* „ |
| 3 feet to 4 feet ... ... ... | 3*s.* 6*d.* „ 5*s.* 0*d.* „ |

Fine bushy plants from open border fit for immediate planting.

JASMINUM NUDIFLORUM ... ... 1*s.* 0*d.* each.
Flowering plants ... ... ... ... 3*s.* 6*d.* „
This is a very desirable winter flowering hardy plant, producing a profusion of flowers of the richest yellow from December to February.

QUERCUS SCLEROPHYLLA. (North of China.)
This is undoubtedly the most remarkable of all evergreen Oaks, having foliage as large as the Spanish Chestnut, and more than twice the substance. Strong seedling plants, 42*s.* each.

QUERCUS INVERSA. (North of China.) Also evergreen, with smooth entire leaves, having remarkably large male inflorescence. Seedlings, 42*s.*

FORTUNE'S YELLOW ROSE, a distinct species, admired by all who have seen it. It would be impossible to describe the combination or richness of the bronze and yellow tints which the flowers present. It is an excellent pillar Rose, and its foliage is distinct. It blooms freely, and in general habit resembles Rugæ. Dwarfs, 5*s.*; Standards, 10*s.* 6*d.* each.

TAXODIUM SEMPERVIRENS.

| | |
|---|---|
| 1 foot to 1 foot 6 inches ... ... | 2*s.* to 2*s.* 6*d.* each. |
| 1 foot 6 inches to 2 feet 6 inches ... | 3*s.* 6*d.* to 5*s.* „ |
| 3 to 4 feet ... ... ... ... | 7*s.* 6*d.* to 10*s.* 6*d.* „ |

Larger in proportion.

VIBURNUM PLICATUM. (North of China). A noble shrub, producing in great profusion large globular heads of flowers of the purest white. Strong plants, 21*s.* each.

WEIGELA ROSEA.

| | |
|---|---|
| 6 inches high ... ... ... ... | 1*s.* 0*d.* each. |
| 1 foot to 1 foot 6 inches ... ... | 1*s.* 6*d.* to 2*s.* 6*d.* each |
| 1 foot 6 inches to 2 feet ... ... | 3*s.* 6*d.* to 5*s.* 0*d.* „ |

These last are fine bushy flowering plants.

Selections of the finest Autumnal Flowering Roses.

| | |
|---|---|
| Standards ... ... ... ... | 15*s.* 0*d.* per dozen. |
| Half Standards ... ... ... ... | 12*s.* 0*d.* „ |

N.B.—We have a large quantity of very fine common Laurels, from 2 feet to 6 feet high; also Spruce Fir, from 2 feet to 4 feet high; which can be sold very cheap, particulars of which can be had on application.
Bagshot Nursery, Jan. 4.

DOUBLE LILY OF THE VALLEY.—In answer to numerous inquiries for the above, and the great satisfaction given by the plants sent out by J. REID last season, he begs to state he has this year a few strong Flowering Roots to dispose of. The graceful habit, delicate appearance, and delicious perfume which the flower possesses, render it equally suitable for the Lady's Posey or the Drawing-room Bouquet. By enclosing 24 penny postage stamps, 12 strong Roots will be sent free to any part of the United Kingdom.—J. REID, Nurseryman and Seedsman, Richmond-street, Weston-Super-Mare, Somerset.

ROSES.

ADAM PAUL AND SON beg to inform their friends and the public in general that they have still a good stock of most of the leading kinds of ROSES, which, when the selection is left to them, they offer on the following advantageous terms:

| | | |
|---|---|---|
| Standard Roses, in 12 superior vars., | 18*s.* to 24*s.* | per doz. |
| Dwarf Standard do. | do. 12*s.* to 18*s.* | „ |
| Climbing Roses | do. 9*s.* to 12*s.* | „ |

A priced descriptive Catalogue forwarded on application.
All packages delivered free of carriage to London.
Nurseries, Cheshunt, Herts, Jan. 4.

NURSERY CATALOGUES.—The following priced Catalogues may be obtained from the Cheshunt Nurseries, free by post.

A. Descriptive Catalogue of Roses.
B. Catalogue of Hardy Ornamental Trees and Shrubs.
C. „ Fruit Trees.
D. „ Hardy Herbaceous Plants.
E. „ Forest Trees.
F. „ Greenhouse Plants, &c.
G. „ Agricultural, Garden, and Flower Seeds.

N.B.—The prices are attached to every article. All packages delivered free of carriage to London.
ADAM PAUL and SON, Nurseries, Cheshunt, Herts.

COLE'S SUPERB SOLID RED CELERY.

W. COLE begs to inform his Friends and the Public generally, that he can supply them with the above article, new and genuine, in sealed half-ounce packets, free by post, for 12 postage stamps.
N.B.—The Trade supplied on liberal terms.
Dartford, Kent, Jan. 4.

WILLIAM H. MAITLAND, SEEDSMAN, 41, Great George-street, Liverpool (late Landscape-gardener to Mr. Skirving, of Walton Nursery), respectfully informs his friends and the public, that he has opened the above premises with a Stock of GARDEN and AGRICULTURAL SEEDS, carefully selected from the best markets; and hopes by sending out none but genuine Seeds of the best quality, and by a strict attention to business, to merit a share of public patronage.
N.B. Designs given for laying out grounds and for Horticultural Buildings. Experienced Gardeners, Foresters, and Farm Servants recommended.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem ... ... ... ... | 42*s.* to 60*s.* |
| Extra superior selected Standards ... ... ... | 18*s.* to 24*s.* |
| Fine Dwarfs and Dwarf Standards ... ... ... | 10*s.* to 16*s.* |
| Superb do. do. (for exhibition) ... | 18*s.* |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 ... | 50*s.* |
| Good do. do. without names, per 100 | 30*s.* |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

MESSRS. J. AND H. BROWN'S NEW PRICED CATALOGUE OF PLANTS FOR 1851, will be sent to all Applicants, for Six Postage Stamps. It includes Orchidea, Stove and Greenhouse Plants, Roses, Geraniums, Fuchsias, Camellias, Azaleas, Conifers, &c. They also offer the following Choice Plants:—

Choice Fruit Trees of all kinds at moderate prices.
Gardeners are especially invited to send us their list of seeds required, as they will be liberally treated.
Albion Nursery, Stoke Newington, London, Jan. 4.

TAME SWANS AND BLACK NORFOLK TURKEYS.—The Advertiser has for sale a pair of very fine 3 year old tame SWANS (Male and Female), in perfect plumage, and very Domesticated, price 3 guineas the pair.—Also a pair of Pure Bred BLACK NORFOLK TURKEYS, year off Birds, fit for Breeding; 25*s.* the Pair.—Orders addressed to ISAAC BRUNNING, North End, Great Yarmouth, will meet with prompt attention.

IT is our painful duty to inform the readers of the *Gardeners' Chronicle* of the Death of our deeply lamented Father, WILLIAM MAY, of the Hope Nurseries, Leeming-lane, Bedale, Yorks. We take this opportunity of stating that the business will still be continued in the same name, under the superintendence of his Sons, and we earnestly solicit a continuance of those favours so liberally bestowed upon our late Father. These Nurseries have long been celebrated for the choice collection of Ornamental Trees and Shrubs, containing also an unrivalled collection of Hardy Herbaceous Stove and Greenhouse plants, extending together over 2000 species and varieties. A choice assortment of Fruit Trees (*Scions obtained from the Horticultural Society of London*). The Vegetable and Flower Seed department is very extensive; every article is of the best quality and warranted genuine. Catalogues will be forwarded gratis on application. All Orders that we may be favoured with will be thankfully received, and meet our best attention. Purchasers may rely upon the best quality of articles being forwarded.

*Orders above 5l. will be carriage paid to London, or within 150 miles, Forest Trees excepted. Post-office Orders should be made payable to* JOHN MAY, *the Hope Nurseries, Leeming-lane, Bedale, Yorks.—January 4.*

---

GEORGE BASSIL'S PHEASANTRY, HEMEL HEMPSTEAD, Herts, within 1 mile of the Boxmoor Station, on the London and North-Western Railway. G. B. respectfully invites inspection and early orders. Having a large quantity, he can supply almost any number of Tame-Bred Pheasants, or Pheasants' Eggs, in the Spring, laid by his own Birds.

---

SUPERIOR BOG EARTH, OR PEAT, SAND, TURF, GRAVEL, and LOAM of the best quality supplied by HENRY BREDEN, Gardener and Seedsman, Canterbury-place, Shirley, near Croydon.

N.B. A large supply of very fine Prince Regent Potato fit for immediate planting.

---

TO BE SOLD, by Private Contract, two substantially built GREENHOUSES in excellent repair, 70 feet by 12 feet, and Front Sashes, Bricks and Tiles, Flues, with stages, and was built seven years ago, at considerable expense; now to be parted with at a great sacrifice, owing to the East and West India Dock and Birmingham Junction Railroad Company requiring the ground for their works. Price low, and by inspection cannot fail to attract the attention of any who may be in want of such materials.—For particulars, apply to Mr. THOMAS STRACY, Florist on the premises, near the Station, Church-street, Hackney, near London.

---

GLASS WATER PIPES.

MESSRS. COATHUPES AND CO., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ¼ an inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

---

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT-FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes.

6 by 4 ins., 6 by 4½ ins., 6½ by 4 ins., 6 by 5¼ ins., 6½ by 5 ins., 12*s.* each.

6½ by 5½ ins., 6 by 6 ins., 6½ by 6 ins., and under 8 by 6 ins., 13*s.* each.

9 by 7 ins., 9½ by 7½ ins., and 10 by 8 ins., 15*s.* each.

Large sizes, 16 oz., 2*d.* and 2½*d.* per foot.

Large sheets, in 200 and 300 feet cases, 2¼*d.* to 2⅝*d.* per foot.

16*s.* per box; or 2⅝*d.* per foot if less than one box be taken:

| | | | |
|---|---|---|---|
| 11 inches | by 9 inches | 13 inches | by 9 inches |
| 12 ,, | by 8 ,, | 12 ,, | by 10 ,, |
| 12 ,, | by 9 ,, | 14 ,, | by 10 ,, |

Boxes charged 1*s.* each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

CUT TO ORDER IN PANES.

GLASS SHADES FOR ORNAMENTS.—Our price is 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the quality of Milk: four tubes in frame, 6*s.* each. Wasp Traps, 3*s.* per dozen. Stands for Pianofortes, 9*d.* each.

MILK PANS 2*s.* to 6*s.* each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Pastry Slabs; Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

N.B. The moderate charge of 1*s.* for each packing case will be made, which we think will be an inducement for parties to retain them; but if sent back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

---

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

---

HARTLEY'S PATENT ROUGH PLATE GLASS, FOR CONSERVATORIES, &c.

See Article in the GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

Supplied Wholesale, Retail, and for Exportation; cut to order in panes of

8 by 6 under 10 by 8.....4½*d.*; 10 by 8 under 14 by 10 .....5*d.*

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

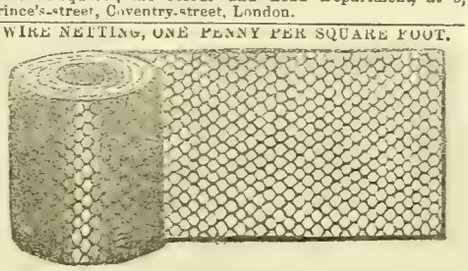
PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

---

SMITHFIELD CATTLE SHOW.—MILK PANS, in stout Glass, of every size and variety of shape, were exhibited as usual, Nos. 148, 149, 150, Bazaar, by Messrs. COGAN and Co., whose collections were honoured (among other Prizes) with the Silver Medal of the Dublin Society in April, as also with the Silver Medal of the Liverpool and Manchester Society, at their meeting, held at Warrington in September last.

NOBLEMEN, FARMERS, and the Public generally, are respectfully invited to notice the NEW GLASS CHURN. LORD CAMOY'S MILK SYPHONS for separating Milk from Cream, GLASS LACTOMETERS for ascertaining the quality of Milk, New Bee Glasses invented by Lord Keane, Glass Cream Pots and Pans, Glass Milk Trays, Glass Tiles and Slates, and every description of Dairy Glass.



Durable Farm Paints, Glass for Hothouses and Garden purposes, may be had (safely packed) for any part of the kingdom, or for exportation, on application at the Stands, 148, 149, and 150, or at the Warehouse, 48, Leicester Square, London.

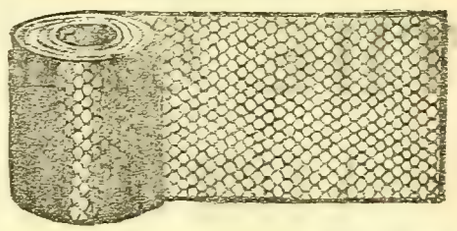
Small Glass for Melon Pits of every size, from 10*s.* 6*d.* per 100 feet; Hartley's and Swinburne's PATENT ROUGH PLATE at the Manufacturer's prices,

Glass Ornamental Shades, Fern Shades, Lamp and Gas Glasses, Patent Glass Pens; Patent Texturalized, Silicated Marble, and other Ornamental Glass, supplied, as usual, at 48, Leicester-square; the Colour and Lead Department, at 5, Prince's-street, Coventry-street, London.

---

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.



| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 ,, ,, | 4½*d.* ,, | 36 ,, ,, | 9*d.* ,, |
| 14 ,, ,, | 6*d.* ,, | 48 ,, ,, | 1*s.* ,, |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

---

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| ¾-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

---

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

---

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

Admission, One Shilling; on Mondays, Sixpence.

---

AGRICULTURAL EDUCATION.

GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN SEED ESTABLISHMENT,

**For Supplying Genuine Home-Grown Seeds Carriage Free.**

JOHN SUTTON AND SONS, SEED-GROWERS, Reading, Berks, being extensive Growers of Seeds, and having many Customers in the Southern, Midland, and Western Counties of England, and in South Wales, have made arrangements with the Directors of the above named Railways (all of which converge at Reading), whereby they are enabled to deliver their Goods *Carriage Free* to any Station on either of these Lines; or to any Railway Terminus in London; or Packet Office in London or Bristol.

SUTTON'S NEW PRICED CATALOGUE OF HOME-GROWN SEEDS, being a careful selection of only the very best kinds of KITCHEN GARDEN, AGRICULTURAL and FLOWER SEEDS, *with prices affixed to each article*, will, it is presumed, be found the *most useful* and convenient of any yet presented to the public, the prices being remarkably low, while the sorts are the best in cultivation. *It will be sent post paid on application, enclosing one penny stamp.*

SUTTON'S COLLECTIONS OF GARDEN SEEDS.

*For the convenience of Gentlemen who may not be well acquainted with all the best kinds of Garden Seeds, and the proper proportions of each generally necessary to stock a large or small Garden,* Messrs. SUTTON *have during the last seven years been in the practice of making complete Collections for one year's supply, the economy and other advantages of which system have been fully appreciated by the purchasers, as indicated by numerous recommendations and annual increase of orders.*

The Collections are increased in quantity this year, and are far superior to any others yet offered to the public, both in quantity and quality.

| | £ | s. | d. |
|---|---|---|---|
| No. 1. A COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS FOR A LARGE GARDEN, for one year's supply | 2 | 10 | 0 |
| No. 2. A COMPLETE COLLECTION OF DITTO, in quantities proportionately reduced ... ... ... ... ... | 1 | 10 | 0 |
| No. 3. A COMPLETE COLLECTION OF DITTO, equally choice sorts ... ... ... ... ... ... ... ... | 1 | 1 | 0 |
| No. 4. A SMALL AND CHOICE ASSORTMENT OF DITTO ... ... ... ... ... ... ... ... ... | 0 | 12 | 6 |

*Choice Collections of Flower Seeds* may also be had, either all hardy or half hardy sorts, and will be sent carriage free with the above, or free by post if Flower Seeds only are required, viz.:—*The best 50 Sorts*, 10s. 6d.; *the best 30 Sorts*, 7s. 6d; *the best 24 Sorts*, 5s.

N.B.—*It is not necessary that remittances should accompany orders from Clergymen, Resident Gentlemen, or their Gardeners.*

Address, JOHN SUTTON AND SONS, SEED GROWERS, READING, BERKS.

FIR CONES.—A Gentleman desirous of completing a collection of rare Cones, such as Araucaria, Cryptomeria; Mexican, Californian, and Himalayan Pinus; Picea, Cedar, &c., would be glad to hear of any one willing to part with them. No objection to the Seeds being out if the Cones are in a good state.—Direct to T. G. P., care of Mr. WELLS, Highnam-court, Gloucester.

AN UNLIMITED STOCK OF REMARKABLY FINE SEEDLING AND TRANSPLANTED LARCHES AT REDUCED PRICES.

WM. WOOD AND SON, being very extensive holders of the above, and all other kinds of seedling and transplanted Forest trees, will be happy to furnish prices on application.

N.B. Catalogues of General Nursery Stock will be forwarded free.—Woodlands Nursery, Maresfield, near Uckfield, Sussex.

SEEDS OF THE BEST QUALITY, CARRIAGE FREE.

J. C. WHEELER AND SON have had the honour of being appointed Seedsmen to the Gloucestershire Agricultural Association. Their Priced List of Seeds for this season is just ready, and will be forwarded free by post to any address on receipt of two postage stamps. This Catalogue is not a long list of useless names; it is really what it professes to be, a List of the best Seeds in cultivation, and will be found a safe guide to all purchasers.

Dr. LINDLEY, in the *Gardeners' Chronicle*, of the 2d March last, strongly recommends it in the following terms:

"THE CATALOGUE OF SEEDS SOLD BY J. C. WHEELER AND CO., GLOUCESTER, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless, incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."

J. C. WHEELER and SON, deliver their Seeds CARRIAGE FREE. Kingsholm Nursery; and 99, Northgate-street, Gloucester.

CUCUMBER—"PHENOMENA."

EDWARD TILEY begs to offer to Cucumber-growers generally the above superb CUCUMBER, which he feels confident will give the greatest satisfaction to them, as did the former kinds sent out by him during the last seven years, being Victory of Bath, Gordon's White Spine, and Lord Keynon's Favourite.

The above splendid Cucumber, "Phenomena," was a hybrid between Hamilton's Black Spine and Mills's Jewess, which it surpasses, both for its prolific qualities and length of fruit, generally growing from 22 to 28 inches. It is a beautiful black spine, of a dark green colour, and free from ribs or shrivels; it also grows quickly, carries its bloom well, and will be found first-rate for exhibition. As a proof of its prolific qualities and length, the following may be vouched for, viz.:—There were cut from two plants, grown in a one-light box, the size of which was 4 feet by 6, 24 brace of Cucumbers, each fruit averaging 22 inches long—total length of the whole amounting to 29 yards 1 foot. It is solid, and eats very crisp. Sold in packets containing seven seeds, 5s.; or three seeds, 2s. 6d.

E. T. has also seed of his three other superb Cucumbers at the following prices:

| | |
|---|---|
| Victory of Bath, per packet ... ... ... | 2s. 0d. |
| Gordon's White Spine, ditto ... ... ... | 1 6 |
| Lord Keynon's Favourite, ditto ... ... | 2 6 |

This last is the best for winter cultivation.

MELONS.

BROMHAM HALL GREEN-FLESH MELON.—This has again this season surpassed all others for its superior flavour; it was placed first and second for flavour at the Chiswick Exhibition last season, and obtained a great number of first prizes throughout the country where exhibited. Sold in packets at 1s. 6d. each.

E. T. has also seeds of the following superb Melons, which he can with confidence recommend:

| | |
|---|---|
| Camerton Court Green-flesh ... ... | 1s. 0d. per packet |
| Queen Melon ... ... ... ... | 1 0 " |
| Blackall's Green-flesh ... ... ... | 1 0 " |
| Bailey's Green-flesh... ... ... ... | 1 0 " |
| Bowood Green-flesh... ... ... ... | 1 0 " |
| Beechwood Green-flesh ... ... ... | 1 0 " |
| Windsor Prize ditto... ... ... ... | 1 0 " |
| Emperor ... ... ... ... | 1 0 " |
| Fleming's Trentham Hybrid ... ... | 1 0 " |
| Duncan's Green-flesh do. Improved ... | 1 0 " |
| Hampton Court Green-flesh ... ... | 1 0 " |
| Egyptian do. do. Improved ... ... | 1 0 " |

Any quantity of the above will be sent postage free to any part on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

CUTHILL'S "BLACK SPINE" and SNOW'S PRIZE CUCUMBERS at 1s. each packet: also his early Scarlet-flesh Melon, 1s. per packet. CUTHILL'S Pamphlet of 56 pages, containing the Belgian Prize Essay on the best way of producing Potatoes; with 12 more articles on fruits and vegetables, among which are Asparagus, Rhubarb, and Seakale. The pamphlet has been very favourably reviewed by Dr. Lindley and others. Price 2s., or by post, 2s. 4d. The trade supplied with the Cucumbers.—JAMES CUTHILL, Denmark-hill, Camberwell, London.

An Apprentice Wanted, aged 17. A small premium required. Two Shillings a week, with board and lodging.

**The Gardeners' Chronicle.**

A CORRESPONDENT of experience and good judgment draws our attention to THE PRESERVATION OF WOODEN FENCES, a subject of no small importance to persons engaged in rural affairs; and he thinks its discussion in the *Gardeners' Chronicle* may be the means of obtaining much useful information, and of removing some of the erroneous impressions which exist respecting the utility of the various compositions that are commonly applied as preservatives of wood-work in general. He considers this to be the more necessary at the present time, from having recently had his attention directed to a statement which appeared in a late number of the *Builder*, and which in his opinion is calculated to mislead those who may place reliance on it.

It is there mentioned, on the authority of a person who is said to have had much experience, and for years watched the effect of the atmosphere on wooden fences, that in all cases—*wood itself*—without any paint, or dressing whatever, had been found the most durable. In proof of this, an instance is adduced of a fence of thin, feather-edged boards, six from the 3-inch deal, having been found, after standing 17 years, perfectly free from any appearance of decay. The same authority also observes with respect to Oak-fencing, that, when put up new, and tarred or painted, a fungus will vegetate through the dressing and rapidly destroy the interior of the wood; but when undressed the weather will gradually dry up the sap, and so harden the wood as to render it more durable by years than when coated by any composition.

"Now, this," says our correspondent, "is so contrary to the generally received opinion on the subject, and to the usual practice, that I think it desirable to ascertain how far the experience of others may tend to confirm or refute the preceding statements. In so far as my own experience enables me to form an opinion, I am decidedly against this novel doctrine, and in favour of using some outward preparation by way of a preservative to all wood-work that may be exposed to the weather. Where good well-seasoned materials are used—whether for fencing, or anything else out of doors—and coated in a proper manner, either with paint, or any of the numerous mixtures of coal-tar, I feel satisfied that wood so treated will be found, after the lapse of several years, to be in much better condition than wood-work which has been exposed under similar circumstances, and left without any paint or outward application. The chief point, however, that ought to be attended to in this matter, and which is too often neglected, is the nature and quality of the fencing material. On large estates, where there is a great extent of fencing to look after, and keep in repair, due care is taken to have always a good supply of wood sawn up and ready for use; but this cannot be done in a general way, and hence it is not unusual, when a fence is required, for green wood to be used as soon as it comes off the saw-pit; and before it has had time to dry sufficiently, the brush is put over it, for the sake of appearance, with paint or coal-tar. I need scarcely say that a fence so treated will not be of long duration, as the very process which was intended to preserve the wood will have the opposite effect, and more speedily hasten its decay. In such a case as this I would readily admit that a fence of common deal, without any dressing, will in all probability be more durable; but what I contend for is, that a fence of dry seasoned wood, when dressed with coal-tar or any similar substance, is better calculated to withstand the weather, and will invariably prove more lasting than one that is undressed."

The best answer that can be given to this expression of opinion must be furnished by actual experiment; and, as our readers include all persons who have much practical experience in the United Kingdom, we venture to hope that they will favour us with the facts within their knowledge. In doing this it will be important to mention—1, the kind of wood referred to; 2, the state of the wood when made into a fence, whether seasoned or unseasoned; 3, the number of years that it has stood; and, 4, its present condition. By way of exemplifying how this may be done most advantageously, for the public information we will ourselves name the following cases:

No. 1. The Hospitium at York consists principally of Oak timber, which has *never been painted*. It is many centuries old, and is sound to this day.

No. 2. The Oak timber employed in old churches for pews, and found in old ruined castles where it was used for beams, as for example at Stone House in Herefordshire, and in our most ancient buildings for roofs, has *never been painted;* all these are many centuries old, and yet they are sound in most cases.

No. 3. The wooden fence, of rent Oak, fixed about 27 years since round the Garden of the Horticultural Society, was *never painted*. The pales are as sound as ever. The only decay is in the posts, where they go into the earth; and there the sap wood is rotten, as usual.

No. 4. About 28 years since a slight fence was put up near where we are writing; it was cut out of Lombardy Poplar, just felled, and was immediately fixed. After being erected it was *coated well with boiling coal-tar*, which sunk deeply into the soft wood. That fence was sound for full 20 years, and exists now, though in a decayed condition. *Question* 1. Would it have stood at all without tar? *Question* 2. Would it have stood longer had it been seasoned before being tarred?

We believe that a series of cases of this kind might be easily got together, and that they would be found extremely useful as guides in forming a settled opinion. Hereafter we shall discuss the matter with reference to general principles, irrespective of evidence either one way or the other.

IN anticipation of the arrival of the GRAFTING season, we commence in another column a careful translation of the theory and practice of the art, as expounded by one of its most eminent modern investigators. Incidentally, we have repeatedly referred to this subject; but we have long felt that the English gardener requires something beyond an explanation of principles, and the meagre statements relating to this most interesting and important art, as they are to be found in books of English gardening. We shall, therefore, now place before our readers, in a series of articles, the views of one of the most refined and skilful continental operators, illustrating his descriptions with woodcuts, drawn expressly for this purpose, and with such truth as, we trust, will render the subject as clear as the processes of any art can be.

The French have long been famous for the variety, singularity, and ingenuity of their modes of budding and grafting. In THOUIN'S "Monograph of Grafts," all that were known to that great gardener were carefully represented and described. But to his pupil, D'ALBRET, belongs the honour of separating the essential from the non-essential, and of reducing his master's long practice to greater method and precision. It is D'ALBRET whom we are about to produce in an English dress, and we feel confident that our readers of every class will agree with us in thinking, that by the publication of his views, a real service will be rendered to practical horticulture. It will then be seen that our cleft grafting, whip grafting, saddle grafting, inarching, crown grafting,

and budding, form but a small part of the methods which the great continental gardeners find it useful to employ, one for one purpose, one for another. And it cannot be denied, that superior as English cultivation is in some respects, it is very far behind that of France, in what relates to the management of fruit trees. Of course, we say this in a general sense only; for we are bound to admit that in some cases the English gardener is not behind his continental rival. These cases are, however, the exception, not the rule; but we believe it is only necessary to teach the gardeners of this country something more than the meagre routine which they learn while young, in order to place them at once on a level with their friends across the channel.

## MARKET GARDENING ROUND LONDON.

GENERAL REMARKS TOUCHING ROTATION OF CROPS, &c.—If we take a five-acre piece of ground, say in November, we shall find it full of Cabbages, which being planted out about the 25th of October, will be strong healthy plants. The moment these are off, the land is again trenched and cropped with early Celery, in well dunged trenches 6 feet apart, with two or three rows of Lettuces or Coleworts in the middle; for market gardeners do not mould up Celery until it is very large (often 18 inches high), so there is plenty of time for a crop of Cabbages, Coleworts, or Lettuces to come to maturity. When the Celery is removed, the ground is cropped with winter Greens, and again cleared off, for nothing pays so well as the London Greens or young unhearted Cabbages. In November Mr. Fitch, of Fulham, has often upwards of 20 acres of these, besides 20 acres of Cabbages; every hole and corner under trees, and all spare places being full. When the five-acred piece is cleared of Coleworts, say by the 1st of March, it is again dunged and trenched and sown with Onions, and very often Lettuces are planted in the beds as well as in the alleys. When the Onions are off, the ground is trenched and planted with Cabbages or Coleworts, &c.; next spring a crop of Cauliflowers, Gherkin Cucumbers, French Beans, or Scarlet Runners is taken off; but the grand point in the course of rotation is to be continually sowing, and whatever plants are ready when the ground is empty to plant these. The land can well sustain so much cropping on account of the heavy dungings, trenchings, and hoeings which it receives. If you ask a market gardener what is to succeed this or that crop, the answer is, "Don't know, it depends upon what is ready for planting." Continued trenching two spades deep for any crop seems expensive; but a strong Irish labourer will turn over from 12 to 14 rods a day, with comparative ease, and I may here state that if it were not for the Irish labourer the prices of vegetables would be much higher. Market gardeners know that after an active crop the top soil for several inches deep is entirely exhausted, and hence the reason for continual trenching, in order to bring up the top soil, that but a few months before had been turned down, with a large proportion of dung, to enrich it and fit it for active use along with the half decayed manure.

Market gardening is well conducted about London, and if young gardeners were to spend only one year with such men as Messrs. Fitch, of Fulham, it would teach them a lesson which would amply repay a twelvemonth's hard labour. They would there be taught how to grow digestible vegetables, and not those stunted blue Cabbages and other things that are, in too many cases, huddled up in walled-in gardens. I am almost certain that the day will arrive when the latter will be converted into forcing grounds, and when vegetables will be grown in the open fields, which are their proper places. If a farmer were to send his son to be a labourer in a market garden for a year or two, the value of such a school to such a man in after life would be great to himself, his landlord, and to the country at large. The expensive system of a market garden would not be required in a farm; it could not be maintained; but it would show him that one acre cultivated by the spade is equal to five by the plough. We know that some market gardeners use the plough; but how does it pay? Their things are always the last sold, and that for the most part to the hawker, whose name will tell the price obtained. It is, however, necessary to have a scarifier plough in all market gardens, in order to tear up the earth after the carts in wet weather. Some years ago I took the late Mr. Smith, of Deanston, over Messrs. Fitch's grounds. Till then he had no knowledge of the enormous expenses of keeping a large garden. "I have not seen," said he, "on the whole 150 acres, a weed; all the ground exhibits a fine level surface; every inch is cropped; all the paths regular; the cart-roads in good order; the hedges of the boundaries very dwarf; no ditches, and all the large plantations of Apples, Pears, and Plums, amounting to 50 acres, with every young shoot made during the summer, pruned down to a couple or three buds from last year's wood." Pruned after the manner of Currant bushes, they look well, and bear enormous crops. The ground under the trees is all cropped with Rhubarb, Currants, Gooseberries; and during the winter with Coleworts and Cabbages. I have seen eight acres of Cabbages in seed beds, after the rest are all picked out for spring Cabbages. Every spare piece of ground is filled; when the Asparagus haulm is cut down, the ground is forked over, and all planted with Coleworts, alleys and all; and when the Rhubarb leaves die down, this ground is also filled, so that altogether, besides the other crops, there must be several hundred thousand heads of Greens for winter market. All liquid manure from dunghills is collected into a large tank; this is conveyed to and distributed over the ground before digging; but the great objection to the use of sewage water after the crop is in, is that it fills up the pores of the earth, cements the mould, and prevents heat and air from acting on the roots.

Some market gardeners keep large herds of pigs, which live night and day amongst the hot dung, and subsist upon the corn that they pick out of the straw and dung, as well as on green food. Mr. Fitch keeps 12 horses, whose whole employment is to cart goods to the various markets, bring home dung, and convey it to vacant pieces of ground, which occur every week. The carts and waggons in use in market gardens have generally broad wheels. The waggons are very large, and the carts will hold as much as a Suffolk waggon. The labourers employed by Messrs. Fitch on 150 acres, amount to about 70 during winter, and in summer to about 150. The rent per acre is from 9*l.* to 10*l.*, the tithes being from 10*s.* to 12*s.* per acre. Men's wages are 2*s.* per day; women, from 1*s.* to 1*s.* 6*d.* Some idea of the amount of labour in small matters will be conceived, when I state that the whole of the frames, amounting to 1000 lights, are all painted and repaired every autumn. The whole of the hand-lights, 4000 in number, are also repaired; and every description of vegetable is washed before it is sent to market. When men are at piece-work, they receive 2½*d.* per rod, for trenching two spades deep; thus an acre highly manured, using cart-loads instead of barrowfuls, and trenching with spade, instead of shallow digging, or what is worse, using a plough, pays just in proportion to the way in which it is treated.

I have now thrown out a few general hints as to the management of a 150 acre garden. In my next and following articles, I shall proceed to particularise some of the leading crops. *James Cuthill, Camberwell.*

## GRAFTING.

No. I.—A WORD ON THE HISTORY OF GRAFTING.—Many authors have written on grafting, and some of them have treated the subject with great clearness. Much has been contributed to it by the celebrated A. Thouin, who published in 1821 an excellent monograph, in which we find the best documents on its history; after his death that work was incorporated with his "Cours de Culture," published in 1827 by his estimable nephew, Oscar Leclerc Thouin. The author of this monograph states, that the discovery of the art of grafting is of the highest antiquity, but its inventor is not known. The Phœnicians transmitted it to the Carthaginians and Greeks; the Romans received it from the latter, and spread the knowledge of it in Europe, where it has become such as we find it at the present day. He adds, that the authors who have treated of the art in some detail are Theophrastus, Aristotle, and Xenophon, among the Greeks; Mago among the Carthaginians; Varro, Pliny the naturalist, Virgil, Agricola, in Italy, and Sickler, in Germany; Bradley, Miller, and Forsyth in England; Olivier de Serres, La Quintinie, Duhamel, Rosier, Cabanis, and the Baron Tschudy among the French; and to these we now add, with veneration, the name of the late André Thouin, whose remarkable monograph contains all the principles and details essential for the guidance of writers and practical men with reference to the art of grafting; for my part I could wish for no other. During the last 13 years of his long and honourable career, he entrusted me with the execution of all the models of grafts which he had collected, to the number of 119,* in his "School of Practical Agriculture," founded in the Jardin des Plantes of Paris in 1797. This fine and judiciously-formed collection is altogether admirable; but I shall here demonstrate only such portions of it as I consider most essential to amateurs and to practical men, who daily experience the necessity of propagating plants, either for the agreeableness of their flowers or for the quality of their fruits, produced by species or varieties which frequently cannot be propagated except by grafting them on wild stocks, or on such as are, in other respects, of little value or interest; but they must naturally belong to the same family, as we shall subsequently explain.

OF THE UTILITY OF GRAFTING.—Gardeners and connoisseurs in horticulture are aware that by grafting many trees can be made to assume very picturesque forms; and it is the means of propagating numbers of woody, resinous, soft, or herbaceous plants, for use or ornament, of which very many give few or no seeds, and are difficult to strike from cuttings or layers; by grafting we make sure of preserving the originals, whether valued for the quality of their fruits, the structure and form of their flowers, their colours, the perfumes which they exhale, or as regards the nature of their wood, the aspect of the trees, the shades and variation of their foliage, &c. &c. Productions obtained by chance, or by fertilisation, either natural or artificial, or in consequence of accidental disease, and many other sports of nature, which would otherwise be lost, or could be but rarely, and after long delay obtained from seed—are readily perpetuated by the art of grafting. It may therefore be viewed as a celestial boon for increasing the amount of our enjoyment. By this mode of propagation we can accelerate the fructification of species or varieties of fruits which are annually obtained from seeds, without however increasing their size, as some have asserted, but falsely, as will be demonstrated by the following experiments. I budded annually, for 15 years, a St. Germain Pear-tree trained as a pyramid. It received the first operation in August, a bud being taken from one of the lateral branches produced by the original, which had then been two years grafted. This bud was inserted about 10 inches from the base of the central shoot. Every year, at the same period, a similar operation was performed; and when the tree had received the fifteenth, it was about 19 feet high. At the age of 18 or 20 years, all the lateral branches from the respective buddings produced an abundance of fruits, which differed nothing from each other, and their flavour was the same as that of the original sort. A similar experiment was also made at the same time on the Reinette Franche, with corresponding results.

I cannot therefore say that grafting increases the size of fruits. Their increase of size is always limited by Nature, as are likewise all the variations which they sometimes take in form. Their fertility, the greater or less perfume and succulent quality of their flesh, are generally caused by the influence of the stocks which nourish them; nevertheless the situation in which these are placed, the quality of the soil from which they draw their nourishment, &c., frequently modify the assertion I have just made, inasmuch as a sort grafted on a stock originally disposed to give large fruit of indifferent quality, and forced to live in a bad locality, cannot possibly give the result we might reasonably expect, were it placed in a more favourable position. *Translated from the French of D'Albret.*

* In a compilation published in 1825 we find a more extensive nomenclature, in consequence of the application of the same operations to different plants. This multiplicity of names seems to have been badly received by the public, the work being still in its first edition.

## BRITISH SONG BIRDS.

No. XII.—In speaking of the Proper Food necessary to be provided for an aviary, I shall take it for granted that the season of the year of which we are treating is summer; and that the united tribes of granivorous and insectivorous birds are together, under one roof. When they are separated and collected into distinct families, in the autumn, of course there will require some alteration of diet; but of this, we shall speak in its place.

Having so large a family to provide for, and so many tastes to consult, it is sufficiently obvious that there must be an ample supply of provisions that may suit the whole. Nature will teach each bird to partake of that only which is easiest of digestion, and best adapted to its constitution. You need be under no apprehension on this head. As for physic, which *some* bird-fanciers prate so much about, I say—"throw it to the dogs." Even they, however, will refuse to swallow it.

Medicine need very seldom be resorted to. There are extreme cases where a little Saffron may be serviceable; but it never cost me more than one penny for Saffron in my life; and that was, one half it, not used. Alterative food with the feathered race, as with us, is far more efficient than physic. The one acts gently, and naturally; the other deranges the system for several days, and if often repeated, injures the entire system. I have already mentioned the "hoppers," or seed boxes. These should be half filled with a mixture of Canary, Flax, and Rape seeds; all of the newest and best. Old seed is very injurious. Of these, the proportions should be—Canary, one half; the other half consisting of Flax and Rape. A small quantity of the latter will suffice, it being eaten principally and sparingly by the linnets. Flax is good for all the seed birds, keeping their stomachs in a healthy state. The "hoppers," as I have before noted, should be carefully examined, at least once a fortnight, and the seed remaining in them should be sifted, to cleanse it from dust and refuse matter, before re-filling.

For the soft-billed or insectivorous birds, the general or "universal" food must be made as follows:—German paste,* 1 lb; 6 eggs, boiled hard; half a pint of Hempseed, well bruised; 6 plain stale buns; 2 table-spoonfuls of best moist sugar. These ingredients, after being placed in an earthen pan (glazed), should be well incorporated with the naked hand, till they amalgamate. Throw in a small quantity of Maw-seed before putting the above into the birds' pans, and place the latter on the floor of the room. Above all, bear in active remembrance that the food must be fresh every day.

In addition to the above, one or two of the pans should contain grated bullocks' liver (from the part called "the nut") boiled hard, and some grated Cheshire cheese, both rubbed fine, and mixed with stale sweet buns, of which all birds are excessively fond. The buns should be purchased of a first-rate confectioner, otherwise they stand every chance of being manufactured from "kitchen-stuff." Many a school-boy's stomach, at this season ("digestive" though it naturally is), will give satisfactory evidence of the truth of my remark.

All your birds, from a canary upwards, will freely share in this soft food; and they will thrive nobly on it. By leaving it to their own option what to select, you will find they seldom, if ever, will have any ailments.

The room must be kept well supplied with ripe Chickweed and Groundsel; Lettuces (in season), Cherries, Strawberries; ripe, mellow, juicy Pears; and now and then a boiled mealy Potato, bruised. The "warblers" eat greedily of the two last; also of soft, boiled, tender Cabbage. Nightingales and blackcaps are dearly fond

* The German-paste, as "made up for sale" in London, is horrible stuff, the whole of it. It is marvellous how birds can be brought to eat it. I have first-rate "receipts" for making a genuine article, which will be given anon.

of the latter; also of Elderberries when ripe; and they greatly luxuriate in a little raw, scraped, tender beef, free from fibre. The beef, when scraped, should be moistened with water, but not made too "pappy;" and it must always be sweet. If tainted in the slightest degree, do not attempt to introduce it.

In the way of live food, throw in occasionally ants' eggs, small red worms, spiders, earwigs, mealworms, livergentles, *et hoc genus omne*. The windows being kept constantly open, hundreds of flies, gnats, and other minute ephemera, will find their way in; and no small amusement is it, to watch the gyrations of the birds as they topple over to catch their prey. The wagtails, whitethroats, and tit-larks, in particular, are most elegant in their motions, while thus occupied.

There have been many opinions on the subject of giving your birds Hemp-seed. It certainly does tend, homœopathically, to shorten the duration of their lives; but still, strange though true, they cannot live without it! It warms their stomach, and possesses an oleaginous peculiarity of flavour, which, mixing with the other food, forms a good general diet. It must be given sparingly. Many people feed goldfinches, in cages, with Hempseed; this is quite a mistake. Canary and Flax is all they should be allowed. They thrive well on it, and escape getting over-fat—the ruin of half the race. Their plumage, too, is always in beautiful order.

To prevent the necessity for "medicine," properly so called, let some crumbs of bread be scalded with boiling milk; into this put some grocers' currants, after previously soaking them some hours in cold water. All softbilled birds, nightingales, blackcaps, garden-warblers, and whitethroats in particular, eat voraciously of this dish; and as boiled milk acts medicinally on all birds, its curative properties will speedily became apparent.

If my instructions be fully carried out, and plenty of old mortar, well bruised, be kept constantly on the floor, no Sanitary Commission need ever be appointed. It is with birds as with ourselves—air, exercise, temperance, and proper diet, will "pull us through" to a good old age. *William Kidd, New Road, Hammersmith.*

## ROSES IN CONTINUOUS BLOOM.

As a wind-up to the few papers which I have written upon the classification of Roses, I now offer a list of those which, out of all the varieties of Roses recommended to me by different nurserymen, have been most constantly in flower; and permit me to say, formed the most pleasing objects for the longest time. I am far from satisfied that I have mentioned all, or even nearly all that deserve a place among those comprised in my favoured list, but I should feel greatly indebted to the more extensive cultivators if they would turn their thoughts to improving it, or giving us a better. In a general flower garden, or in a Rosery, I hold that the great feature of bloom should be never impaired, but let it not be supposed that I would discard the many noble varieties which flower for a month and depart, but they should have a place to themselves, and not assist in throwing a gloom over borders, or making blanks among the family of ever-blooming kinds. Let us suppose that we were actually confined to two colours, red and white, and that a row of these on each side of a path, or a bank of them formed of dwarfs, half-standards and whole ones were on each side, these two kinds being always in flower during several months, would look infinitely better than a general collection half or two-thirds of which were without a bloom. But we are not confined to two varieties, nor ten; I only wish to show that it is better in a place where Roses form a principal feature, as they ought in all gardens, to have 20 of a sort in flower, than 20 sorts without five or six in good bloom.

As a class which has disappointed me most I would mention the so-called Hybrid Perpetuals. They are anything but perpetuals, and if I must follow the sections or families as now classified, I like best the Noisettes, the Bourbons, and the Chinas; but there are exceptions, and marked ones, and I cannot help repeating my wish that the Rose nurserymen would reclassify, if I may so express myself, the whole family of Roses. At all events, let those who want a hundred, or five hundred, or a dozen, confine themselves to particular kinds for all that have to figure in the general scenery of a well kept garden, and not be afraid of half a dozen or half a hundred of a sort, and let them grow the summer varieties, no matter what family they belong to according to the catalogue; but I mean all those which only bloom a month, in a portion of the garden out of the general scenery. I strongly recommend every body who has a hundred or two varieties planted for ornament, to remove all the summer kinds at once to some place adapted for a general collection, and order continuous flowering varieties, 20 of a sort, if necessary, to fill their places.

I hope I have said enough to induce Messrs. Rivers, Wood, Paul, Curtis, Hooker, Francis, and other Rose-growers, to turn their attention to the subject of publishing catalogues with some note showing which are continuous bloomers; for all the world ought to know that perpetual means, at the best, only temporary; hybrid perpetual no better, while many other families embrace Roses as contrary in habit as any two different sections. I likewise hope they will reiterate such of my notions as they approve, and add their powerful influence to mine to induce amateur Rose-growers to follow so much of my advice as they may deem wholesome. The following are the varieties which bloomed the most continuously; they were planted in good loam and dung, and I did not make my final notes till they had flowered the second season.

Fellenburg, Noisette.
Jaune Desprez, do.
L'Amie Vibert, do.*
Lucida Duplex, Macartney.*
Maria Leonida, do.
Pourpre de Tyre (Fafait of some), Bourbon.*
Madame Desprez, do.*
Bourbon Queen, do.*
Paul Joseph, do.*
Madame Nerard, do.*
Souvenir de la Malmaison, do.*
Bouquet de Flore, do.*
Proserpine, do.*
Acidalie, do.*
Madame le Charone, do.
The Crimson China.*
Princess Wurtemburg, China.*
Mrs. Bosanquet, do.*
Géant des Batailles, Hybrid Perpetual.
Duchess of Sutherland, do.
La Reine, do.
Madame Laffay, do.
Marquess Boccella, do.
Doctor Marx, do.
Baronne Prevost, do.
Robin Hood, do.
William Jesse, do.
Rose du Roi, Perpetual

Those which are marked with a * are the most constant; but all those not marked were, in respect to continuous flowering, the best of their family. *Crito.*

## VILLA AND SUBURBAN GARDENING.

In pursuing the subject of Pear training, I shall begin by explaining the mode extensively adopted by the great market-gardeners in the vicinity of London, whose contributions constitute the chief supply of Covent-garden Market. The plan which they adopt may not be the most beautiful that could be devised, or one that we would wish to see in gardens of high pretensions, still it appears to answer their purpose; and there may be many amateurs who pursue gardening upon economical means, looking forward to a remunerative result rather than to nice appearances. The market gardeners usually plant the large and finer kinds of Pears by the sides of roads and pathways in their orchards, and they are trained horizontally, without much regard to regularity. Horizontal training, when carried out perfectly, requires the leader to be kept down until the number of shoots requisite to form a perfect symmetrical tree is induced. The market gardener pays no regard to this. His object is the rapid production of a tree, from which he expects to reap his reward; and he finds that these rude espaliers are quite as productive as the wire-drawn looking examples of high artificial gardening on a gentleman's garden wall.

The materials which they use for the purpose of training upon are of the rudest possible kind, being frequently mere stakes cut from their hedges. Little regard is paid to their uniform thickness or straightness, the only point being to keep the trees in a direct line; as the extremities of the branches meet, they fasten them together, and within a short distance of where I now write there are actually walls of these espaliers supporting themselves without either stakes or anything else. One of the most important advantages of this mode of training is, that when the trees are in full blossom, and when frost is apprehended, a temporary covering may be thrown over these espaliers without much trouble or difficulty, and the crop, in spite of all atmospheric influences, is positively secured. This is a matter which deserves the attention of all Pear cultivators. Much care is bestowed on the Peach; but the Pear is a more valuable fruit, for at this season, when we have few other fruits for the table, some Pears are in high perfection, and their value is just enhanced, in proportion to their excellence, in conjunction with the absence of other native fruits. *Pharo.*

## NOTES OF A TRAVELLER.—No. XV.

Chinese Azaleas and Azalea Gardens.—These gardens, in the neighbourhood of Shanghae, are not less interesting than those in which the Tree Pæonia or Moutan is cultivated, and which were described in my last letter. About five miles north from the city there are two nurseries, each of which contains an extensive and valuable collection. They are generally known as the Pou-shan gardens, and are often visited by the foreign residents at Shanghae. A few days after my visit to the Moutan district, I set out to see the Azaleas, which I knew were then in full bloom. My road led through a country, which is perfectly level, and in a high state of cultivation. It was spring time, and everything teemed with vegetable life. Deciduous trees were now covered with fresh green leaves, as yet uninjured by the attacks of the insect tribe; Wheat and Barley were in ear, and in some places tinged already with a yellow ripening hue, and the air was scented with the field Bean, which was in full bloom. Clumps of trees were dotted over the country, generally divided pretty distinctly into two kinds—deciduous and evergreen. The deciduous clumps marked the spots where the villages and farm houses were situated; the evergreens, consisting chiefly of Cypress and Juniper trees, were growing about the tombs of the dead.

Little more than an hour's walk brought me to the garden I had come to visit. There were no external marks, such as name or signboard, to direct the stranger to the garden; indeed, a person unacquainted with the customs of the Chinese would never have dreamed of finding such a beautiful place as this is, in a poor country village. Going up a narrow passage between two houses, I reached the residence of the nurseryman. He received me with great politeness, asked me to sit down in his house, and called to one of his sons to bring me a cup of tea. Having sipped the favourite beverage, I then walked out with him to inspect his garden.

In the front of the house where we had been sitting, three or four flat stages were covered with Japanese plants, of which the old man had a good collection. A small species of Pinus was much prized, and when dwarfed in the manner of the Chinese, fetched a very high price; it is generally grafted on a variety of the Stone Pine. The Azalea obtusa, and some varieties of it with semi-double flowers, were in full flower, and highly prized by the Chinese. The colour of this species is much more brilliant and dazzling in China than I have ever seen it in England. A beautiful variety, quite new, had small semi-double pink flowers, which it produced in great profusion. This will be a great favourite in England when introduced to our gardens. Its novel colour, small leaves, and neat habit will render it most desirable for bouquets and other decorative purposes. I have named it Azalea amœna. On the stage with this plant I observed a new species of Holly, which is likely to be of some value to English gardens. I have named this species Ilex Reevesiana,* and thus describe it:—A dwarf shrub; leaves entire, elliptical, acute, slightly wavy; dull green, and covered over with small dots, somewhat like Elæagnus; flowers on short spikes, terminal; fruit large, of a deep red colour. A very ornamental bush, which flowers in the winter months, and ripens its fruit during the following autumn like our common English Holly. It is the Wang-sang-qui-wha of the Chinese, and said to have been brought from Wang-San, a celebrated mountain in Hwuy-chow.

After looking over the plants upon the stage, I passed on to the main portion of the nursery, which is situated behind the house. Here a charming view was presented to the eye. Two large masses of Azaleas arranged on each side of a small walk were covered with flowers of the most dazzling brightness and beauty. Nor were they common kinds. Generally they belonged to the same section as A. indica (the varieties of A. variegata do not flower so early), but the species so common in Canton and the south were comparatively rare here. A most beautiful kind having the habit of A. indica and half deciduous, had its flowers striped with pale blue or lilac lines, and sometimes blotches of the same colour upon a white ground. Another species allied to this had red stripes, and a third was mottled and striped in its flowers, the colours being still the same. These are all quite new, and they flower early in the season, fully three weeks or a month before that section to which A. variegata belongs. A red variety, which flowers later, is particularly worthy of notice. Its habit is different from any known species, its leaves are dark green, shining, and evergreen; and its flowers are of a deep clear red, and very large. Each flower measures from 3 to 4 inches in diameter. It is said to be a Japanese species.

I now passed over a little wooden bridge to the third compartment of the nursery, which contained a collection of the common shrubs of the country. Along the banks of a ditch, through which the tide ebbs and flows, there is a row of the far-famed Qui-wha, or Olea fragrans. In England we know nothing of the beauty of this charming plant. Here it is a fine evergreen bush, always handsome, and in the months of September and October literally covered with its fragrant blossoms. One tree is enough to scent a whol garden. I have often sat down under the shade of these very bushes, in the midst of this perfumed atmosphere, and almost fancied myself in the garden of Eden. *R. F.*

* Named in compliment to Mr. Reeves, whose kind introductions have been of great assistance to me in China.

## Home Correspondence.

*Aquatic Floriculture.*—I would gladly learn what has been ascertained, and see fresh experiments made, concerning aquatic plants. It is worthy of enquiry what character distinguishes palustrian from aquatic plants. Certainly not alone the natural habitat, for we know that plants will flourish where they are not found wild. A plant whose roots grow under the water level is, *quoad*, its roots, aquatic; only its stem, or the lower part thereof, is embraced by air and not by water. The tendency of a plant to have its stem or leaves corrupted and macerated by immersion, while its roots are proof against it, would seem to me to be the distinctive palustrian character. But is it not an interesting field of experiment to try in how many instances such a distinction really exists, prejudicially to the beauty of our ponds and tanks? This is remarkable in some aquatics, that they are not so, and that in the extreme degree. Crinum capense grows, flourishes, and blows in my pond, rejoicing in water and ice, with boys and girls skating over its bulbs; and it does all the same in the south border against my house through the long droughts of spring and summer. Calla æthiopica flourishes in deep water, and lives well enough on a neglected shelf of a greenhouse, in a brick of dry earth. Iris Pseud-acorus will live for years in raised borders and unwatered. Epipactis palustris grows in a raised border against my house, watered by me when I remember it, and by nobody when I do not, or when I am absent for weeks. Since absolute subaqueous aquatics are patient of drought in its utmost degrees short of growing like a Snapdragon on a wall, there is surely reason to doubt whether the nature of many plants will not bear stretching in the other direction. For only consider how vast is the distinction between plants growing in a pond, and plants baked in a pot, or roasted under a dry south wall; and how trivial seems the distinction which separates plants rooting under the water-level from those which grow under a water surface. The wild yellow Iris (Pseud-acorus) is common in muddy ditches, and I read that it is also found in shallow ponds. It may be the only Iris

of the section called by nurserymen the English Iris, abounding in such various and beautiful colours, that will bear water. But the probabilities, *à priori*, must be rather the other way. I have planted in ground which, when the springs rise, will be the shallow edge of a pond, a very strong tall-growing yellow and white Iris, name unknown to me. Also the Epipactis, and plants of the common Agapanthus, deep. I shall try Orchis latifolia next year, for I cannot find it at this season. But my curiosity extends farther, to know how many plants, not even reputed palustrian, such as Canna, Dodecatheon, Funckia, Hemerocallis, &c. (you can suggest better than me), may not peradventure be found as hard drinkers as Crinum capense, though now considered as sober as that was when people called it Amaryllis longifolia. Patience of water I consider very distinct from patience of air between wind and water; and I wish to learn the average and the maximum ice depth in still water. No doubt there are works in which the whole matter is discussed in a knowledgeable manner. But there must be many persons who share my ignorance of those branches of literature, and to whom any mental illumination you are willing to pour into them will be highly acceptable. *A. H.* [This letter suggests so many important inquiries that we gladly submit it to the consideration of our readers. Hereafter we shall recur to it.]

*Rose Catalogues.*—It appears to me that, if our large Rose-growers had their lists printed in alphabetical order, placing the class to which each Rose belongs in a column to the left or right (instead of having each class by itself), it would do away with the great difficulty which is now experienced in finding any particular variety, when ignorant of its family; and also prevent errors, as a sort in one class frequently bears the same name in another class. *C. C., Dec.* 19.

*Material for Fountains.*—Your correspondent on aviaries recommends zinc; now, any chemist will tell him that it is very dangerous, depending much on the nature of the water, whether it be not absolutely poisonous. I am surprised that I do not see among your advertisements, any for fountains made of stoneware; although this substance would not do for statues, or even vases, from its refracting too much light, that would not be so objectionable in a fountain which, from being always wet, is in the same predicament; it is very cheap, does not get mossy, or decompose, as do all cement fountains, and can, by "toning" the glaze, be made, at first setting up, to look reverend. Another material is "Peake's terro-metallic clay," or whatever it may be; this need not be so dark as it is usually made; it can be burnt rather ruddy, and nothing endures longer. *Jay, Somerset.*

*Tacsonia mollissima.*—At page 805 of your last year's volume a correspondent complains that this plant does not flower well with him, and states that he has discarded it from his conservatory. I consider that he has acted hastily in throwing away such a valuable plant. With me this Tacsonia commenced blooming about the middle of May, and from that time till the middle of October it has had daily from 50 to 100 fully expanded flowers on it. A few blossoms continue to open up to the present time; and we are of opinion that they are better formed and of a richer colour each successive year. The specimen here, which has been the admiration of every one who has seen it, was planted in the summer of 1847; though small it soon reached the top of the house, and now it spreads in four different directions on the roof, each branch being about 70 feet from the root of the plant. I pruned it very closely some time in February, and during the summer its shoots (which are often elegantly festooned) nearly reach the border of the conservatory; they commence flowering when about a foot long, and blossom at every joint during the whole period of growth. *J. Pringle, jun., Stoke Rockford Gardens.*

*Royal Botanic Garden, Edinburgh.*—I have seen lately in the *Chronicle* some notice respecting this Botanic Garden (more especially by "Dodman" and "G., Hammersmith") which would seem to imply that matters are conducted by us here in a very illiberal and exclusive spirit. Now I am anxious that the public and your correspondents should be set right in the matter, by a plain statement of facts. The garden is open to the public every lawful day. Anyone may walk in the garden who chooses. The hours of admission in summer are from 6 A.M. to 6 P.M.; and in winter from daylight to dusk. The houses are open to the public on Saturdays from 12 to 4 in summer and from 12 to 3 in winter. I wish I could have them open every day, but I have not the means of employing a sufficient number of hands, so as to enable me to do so without injury to the other work in the garden. I hope to be able to make arrangements so as to open the houses two days a week to the inhabitants of Edinburgh. Any stranger coming to Edinburgh is admitted to see the houses on any of the other days of the week, on mentioning his wish to the porter at the gate. Your correspondent "G." has made a mistake as to the hour when the houses are open on Saturday, and his statement would almost lead to the belief that the garden itself was closed against him. The day of his visit was Saturday, and as that is the day when the public are admitted, it is not convenient to allow any one to visit the houses in the forenoon when the watering and syringing of the plants and the washing of the floors are going on. This will account for Mr. M'Nab requesting "G." to delay till 12, and asking him in the meantime to visit the winter house in the experimental garden. There was no wish to do anything illiberal on Mr. M'Nab's part. He acts, I believe, precisely in the way in which his worthy father did as regards the admission of strangers. I have always advocated the importance of having gardens and museums open to the public. I am particularly desirous to see the working classes take an interest in them, and with that view I throw open the houses on all general holidays. I trust that this statement will show that I do all within my power to accommodate the public. *J. H. Balfour.*

*Vine Culture.*—I beg to offer the following replies to "W. C. E.'s" queries, at page 806 of your last year's volume. First, the age of the Vine has nothing whatever to do with the colour of the Grapes. The latter, I imagine, depends principally on the kind of atmosphere maintained in the house. As regards stopping, they ought not to be allowed to make more than one leaf beyond the bunch of fruit; if they are permitted to ramble beyond this, the Vine exhausts itself in making useless wood and leaves. As to liquid manure, it should be applied while the fruit is swelling; all fluids should be entirely withheld at the ripening season. Respecting temperature, I should not attach much importance to it at ripening time, but in dull damp weather I should light fires and give plenty of air at the same time, for the purpose of keeping the atmosphere in motion. Grapes are both better coloured and flavoured when the growth of the Vine is suspended than when it is permitted to be continued. As regards the late bunch being better coloured than the early ones, possibly more air was given at the time of its ripening, and probably the Vine was altogether in a more mature condition. The fact of the Vine making a late bunch is a proof that it had been kept growing at the time of ripening the first fruit, which, in my opinion, sufficiently accounts for the crop not ripening well. If by any accident the growth of the plant is suspended, fruit of any kind, even if not half swelled, will always partially assume the colour and flavour of ripeness. This is easily acted upon in a Vinery, where the conditions are so completely under the control of the gardener. *Anon.*—My experience supplies me with the following answers to "W. C. E.'s" questions. 1. Young Vines require rather more judgment than old ones in their management, to cause them to produce the finest Grapes. 2. Old Vines, like old Melon seed, are sure to produce fruit with less management than young ones, the vigorous sap being checked in having to find its way through so many wounds (?)—inducing the production of short-jointed firm wood; but neither old Melon seed, nor old Vines, will produce so fine fruit as when they are fresh and vigorous. 3. The shoots ought to be stopped at the first joint above the fruit; then as they break stop a joint further, and a joint further, by which time the extremity of the shoot will be nearly exhausted. Laterals under the fruit should be taken clean away; and if there are any above the fruit, stop them at the leading shoots. 4. It is a barbarous practice to let Vines ramble, and then cut off great quantities of shoots; some say it strengthens the shoulder of the bunch, but that is wrong. 5. Give abundance of liquid manure, with heat at the time of swelling; as they approach ripening lessen both gradually. 6. As they approach ripeness, as I have just stated, the temperature should be gradually lessened, and more air given, and when ripe the house ought to be as dry as a sitting room. 7. The production of the black bunch after the main crop was cut is, I have no doubt, owing to the house having been kept cooler, and to the bunch being brought forward in a more natural way, though perhaps the berries were smaller than those of the first crop. *D. Kidd.*

*Syringing with cold Water, a remedy against the effects of Frost.*—Your leading article last week, on the manner in which cold acts on plants, reminds me of the following circumstance:—In the spring of 1826, or 1827, when I resided at "the Cedars" at Putney, the only border which my next door neighbour and myself had for growing early Peas, had an east aspect. A very severe frost (10°) came over that district about the 15th of May. The Peas were in full bloom on my neighbour's border, as well as mine. I syringed all mine with cold water. My neighbour, on witnessing the operation, said that he would not kill his in that way. I saved all mine, he lost all his. This taught me a lesson which I never forgot; and by the same means I have often saved the Peach, Pear, and other fruits, as well as Gooseberries, after they were a good size. I have, however, failed in the case of a continuance of frost, such as has occurred during the last two or three springs. *James Cuthill, Camberwell.*

*Gutta Percha Piping.*—A gentleman has just called our attention to an article on this subject in your Paper of the 28th December; we therefore beg to inclose you copies of some of the letters which we have received from persons who have used our tubing for the conveyance of water, which is the best answer we can give to the inquiry of your correspondent. With regard to the question of "rats," the reply we may give is, that we have yet to hear of the first case of their attacking gutta percha. The Canal adjoining our works abounds with rats, and we have never found them to touch any of our material. *The Gutta Percha Company; W. T. B. Smithies.*

## Societies.

LINNEAN, *Dec.* 17.—R. BROWN, Esq., in the chair.—Mr. Westwood made a communication on the subject of a wingless bird, discovered by Captain Poole, of the East India army, in Lord Howe's Island. This island, which was situated about half-way between New Holland and Norfolk Island, was formerly uninhabited. It had, however, been visited by Captain Poole, who thinking it capable of becoming useful as a port for provisions for whalers, was induced to attempt to colonise it, and had succeeded in inducing half-a-dozen Irish families to settle on it. The British Government had not claimed it, and it was now Captain Poole's property. On this island they had discovered a wingless bird, about the size of a rail, and which had turned out very good eating. Such a bird was not hitherto known among naturalists, and it was interesting in connection with the discovery of the great group of extinct wingless birds in New Zealand, and the recent specimen of the Notornis. No specimen of this bird had yet been sent to this country, but some were on their way.—The conclusion of Mr. Benjamin Clarke's Paper on the position of the carpels, as a means of classification of plants, was read. Mr. Jones, of Dalston, called the attention of the Fellows of the Society, after the meeting, to the presence of an Acarus in almost every specimen of moist sugar that could be obtained. Seven specimens were sent for and exhibited, and in each the presence of the Acarus was detected. In each case the animal was dead. It was stated that in the sugar, as imported from the West Indies, this creature had been found.

BOTANICAL OF LONDON, *Nov.* 29 (14th Anniversary).—The President in the chair. Various donations were announced as having been received since the last meeting. The Secretary read the report of the Council, from which it appeared that 13 new members had been elected since the last anniversary, making the Society now include 255 members. The distribution of British and foreign plants had been carried on regularly and numerously, and many valuable parcels had been received recently, the results of exertions made by members during the past summer. The Council had requested Mr. Hewett C. Watson and the Secretary to prepare a 3d edition of the "London Catalogue of British Plants," a copy of which, in proof, was laid on the table. The report was unanimously adopted, after which a ballot took place for the election of officers for the ensuing year. Mr. A. Henfrey, Vice-President, then read a brief report on the progress of botany and botanical literature during the year 1850, to the following effect: "The present year has not been signalised by any remarkable discovery or publication in the department of physiological botany. Many interesting papers have appeared on various subjects in the journals, contributing to increase our knowledge of development, and of the character of the elementary structures; but the phenomena of cell formation still present a wide field for investigation. The third German edition of 'Schleiden's Principles of Scientific Botany' has been completed, and offers one point worthy of note, namely, the author's continued assertion of the truth of his original view of fertilisation on the Phanerogamia, in opposition to almost all recent observers. A new edition of Dr. Asa Gray's useful 'Manual' has also been published. In the department of systematic botany much more activity has been displayed, so far as publication is a criterion. In addition to the numerous fragmentary notices in the botanical journals, many important separate works have appeared. A fifth volume of Kunth's 'Enumeratio Plantarum' has made its appearance since his death. Professor Unger has published a synopsis of all known fossil plants. Mr. Woods has brought out the 'European Flora,' in which he has been so long engaged. Several local European floras have been presented to the world; many of which may be noticed: 'Mayer's Flora of Hanover;' the completion of 'Fries' Summa Vegetabilium;' and the commencement of a new illustrated work, called 'Plantæ Scandinaviæ,' by Mr. Andersen. Of new editions, we have one almost constituting a new work, in the sixth edition of 'Hooker's British Flora,' by Dr. Arnott, a most valuable contribution to British botany; and a second illustrated edition of Professor Harvey's excellent 'Manual of British Algæ;' numerous other works of less general importance have contributed to swell the list. Botanists have to lament the death of many active followers of the science during the last twelve months. Professor Kunth, of Berlin, Dr. Corda, Prof. Raffeneau Delile, of Montpellier, Dr. Dietrich, well known by his horticultural works, together with Professors Moritzi, George Hecker, and Drs. Berger, Hagenbach, and Martius, the father of Professor Martius. We have more particularly to deplore the loss of a young and zealous aspirant for botanical honours, Mr. J. H. Wilson, whose awfully sudden death came like a thunder clap on those who saw him full of life, and apparent health, at our last monthly meeting."

ROYAL HORTICULTURAL IMPROVEMENT OF IRELAND.—A meeting of members was lately held at the Rotunda, for the purpose "of considering the propriety of establishing a Benevolent Fund in connection with this Society, for the relief of aged gardeners and their widows, and also, in extraordinary cases of unforeseen necessity, young men." Several resolutions in favour of the project were proposed and adopted, and at the close of the meeting a sub-committee was appointed to carry out the objects which it had in view.

## Notices of Books.

*Rambles and Observations in New South Wales.* By J. P. Townshend. 8vo, pp. 312. Chapman and Hall.

THE object of the author of this amusing book is to add something to the information accessible to persons in-

tending to emigrate to New South Wales. He gives an account of what he saw while in the colony, expresses his opinion pretty freely upon an emigrant's chances, and takes a dispassionate but, upon the whole, a favourable view of the advantages to be found in a settler's life, under particular circumstances. It is, however, to be feared that even here we have not a perfectly fair view of the New South Wales question, even although Mr. Townshend may, as he says, have finally quitted the colony, have no land to sell, and no interest in puffing any particular locality; for we find him admitting that he has "contracted a perfect horror of colonial government," and we do not see how, with such feelings, he can take any other than a one-sided view of colonial affairs.

Passing this by, we are glad to be able to say that there is much good sense in Mr. Townshend's work, and that to intending emigrants it cannot be otherwise than useful. That they will be surprised at some of his statements we entertain no doubt; for few think of paying 10*l.* an acre for land, or believe that 20,000*l.* is the necessary capital for a squatter, which our author assures us is the case. We must, however, leave the reader to examine for himself in the book the grounds upon which such opinions are founded, and confine ourselves to a string of extracts.

In speaking of the much-debated assignment system, he remarks:

"For my own part, I have arrived at the conclusion that the assignment system had not a fair trial until transportation to the colony was abolished. When convicts were annually landed in Sydney, in large numbers, as many as possible were thrust upon the public—but a small community—to relieve the Government of the burthen of maintaining them; but thousands were, nevertheless, employed in gangs, in public works—a certain method of effectually depraving them; and bush-rangers and highway robbers were generally those who had escaped from such gangs. Hence, also, on some large farms, two or three hundred convicts were assembled together, instead of being dispersed as they ought to have been; and we can hardly hope that, when they were a drug in the market, they were as well treated as when it was announced that no more would arrive in the colony; indeed, we may be sure they were not, and dreadful stories are current of cruelties suffered by the convicts, principally by means of excess of corporal punishment. Some, on the other hand, received no punishment at all, being assigned to their wives, who would precede them, and, in some cases, actually with the fruits of the crime for which the husband was transported; whilst others were made clerks in the offices of the Government, or attained some other easy berths; but it would be tedious to detail all these abuses. If the men, however, were not properly dealt with, what was once the fate of the women?"

The following bits of advice to emigrants are, we doubt not, much needed:

"The emigrant, however, should not lay out his money in the extravagant outfits that are often procured. He requires little else than bedding, three dozen shirts, a shooting-jacket or two, and a great coat. If he procure many other articles, he will find them only an incumbrance. Bush clothes he can procure at a reasonable price in the colony; and the best tailor in Sydney is Mr. Alderman Broughton.

"The emigrant should always take a handful of sovereigns with him, lest the ship may call at some port; but, beyond this, he should carry all his cash to the office of the Union Bank of Australia, in Old Broad-street, and exchange it for a letter of credit on Port Phillip or Sydney."

"On going on board some of the ships bound for New South Wales, it would be easy to imagine that one had boarded a pirate, all the passengers seeming to think it necessary to be armed to the teeth. Double guns, duck guns, rifles, pistols, swords, &c., adorn the different berths, and the passengers themselves are often in full piratical costume. But the expense of buying these arms is useless; and, if the owners of them could be followed to their destination, such weapons would probably be soon found rusting neglected in a corner. A good gun, a few bags of large shot, and a few pounds of powder will, however, be found useful in the bush; and in Sydney a good gun can sometimes be bought for a few shillings, the piratical gentlemen aforesaid being often anxious, in the course of time, to sell their weapons. Powder and shot are comparatively dear in Sydney.

"Some emigrants expend their money in buying the most absurd luxuries, such as champagne, pots of preserves (the latter lest they should be sea-sick), polished boots, and musical boxes; but these follies must be avoided. Others take out bulls and stallions. I do not think that it is worth while to take out horned cattle; but any one taking out a good stallion, as much as possible the style of the English hunter, could, by letting him, or by taking in mares, make a good thing of it. Many, again, take with them the most frightful and savage-looking dogs they can pick up, thinking therewith to frighten the blacks; but this also is unnecessary. A stallion should, of course, be insured against sea-risk."

"It is useless to say much on the subject of the books an emigrant should take with him, but I think no one would repent taking out a few standard works, and a set of the 'Edinburgh,' the 'Quarterly,' or 'Blackwood.' The most acceptable present that could be made to any friend already in the bush would be a cask of English beer; the next, a copy of 'Pickwick.'"

"Nothing ought to be more firmly impressed on a new hand in the colony, than that he must first understand the colony before he can hope to commence operations in it with success; and I know no means whereby he can obtain information so well as by travelling; and the expense of this is trifling."

"A settler must never get into debt. Money is not to be procured in New South Wales as readily as in England, and a small debt may ruin a family, as many unfortunate people who have been in arrear for their quit-rents have found to their cost. Hence, the settler must avoid debt as he would the pestilence, and never expend his whole capital, but keep a reserve fund as a sheet anchor."

"In buying land the emigrant must ascertain that it does not form part of a grant on which arrears of quit-rent are due, or the Government will quietly allow him to take possession, and then levy on him for the amount due on his purchase, and on all the remainder of the original grant also. He must also be careful that his title is not derived through a convict under sentence."

We have only to add, that of matter of this quality Mr. Townshend's book is full.

## Miscellaneous.

*Victoria regia.*—For many years this plant has been allowed to bear the name which was first given to it by an authority which we at least shall not presume to question. But some attempts have been lately made at effecting an alteration, which he, to whom the high honour was assigned of rendering the plant known, under the name of Victoria regia, is bound to resist. In "The Annals of Natural History" for August, 1850, Mr. John Edward Gray asserts that its proper name is that imposed by himself, namely Victoria Regina; because, in a Report of the Proceedings of the Botanical Society, in the *Athenæum* of the 9th of September, 1837, a description is printed of a "new genus of Water Lily named Victoria Regina, by permission of Her Majesty;" because at a meeting of the British Association, on the 11th of September, 1837, he "remarked, that it would form a new genus intermediate between Nymphæa and Euryale, and proposed to name it Victoria Regina," &c. &c. &c. He then goes on to say that in the index to the *Athenæum* for 1837, under the head of Botanical Society, there occurs, "Schomburgk on the Victoria regia, p. 661," which is evidently an error of the press, as the name in the page referred to is V. Regina. He further states that, "Shortly after the appearance of the description and figure in the 'Annals of Zoology,' the Secretary of the Geographical Society borrowed from the Botanical Society the original description and drawing of the plant; that the papers found their way into the hands of Dr. Lindley, who printed, for private distribution, 25 copies of an essay on this plant; that he adopted the view which had been stated before the Botanical Society and British Association, that it formed a genus intermediate between Euryale and Nymphæa; but that he called the plant Victoria regia, thus continuing the error of the printer of the *Athenæum*."

This is answered in the last number of "Paxton's Flower Garden," by the production of the following *précis* of the letters, &c., relative to this transaction, as they appear in the records of the letter-book of the Geographical Society:—1837, July 18th.—Letter from Schomburgk, announcing the discovery of a Water Lily, stating that he has sent two sets of drawings home, with a request that, if a new genus, he might be permitted to append to it the name of Victoria July 21st.—A packet, containing these, arrives. The president of the R.G.S. communicates with Sir Henry Wheatley. July 26th.—Sir H. W. signifies the Queen's commands that the drawings be sent to the palace. July 27th.—The president, to Sir H. W., sending drawings, and adding request that the flower may bear the name Victoria. July 29th.—Sir H. W. to president, signifying Her Majesty's pleasure, that the name of *Victoria Regia* should be affixed to the flower. Drawing returned for the purpose of enabling this to be done. July 30th.—The Sec. of the R. G. S. to the Botanical Soc. forwarding one copy of the drawings, &c., and adding, that as Mr. S. was travelling entirely under the control, and at the cost, of the G. S, the Council were of opinion that whatever drawing he may wish to present to Her Majesty should pass directly to the Queen through the hands of the R. G. S., and they therefore relieve the Botanical Society from any further trouble on that account. Aug. 1st.—Sec. of R. G. S. to Mr. S., stating that his drawing had been presented to the Queen, that Her Majesty had accepted the dedication under the name of *Victoria Regia*. Aug. 3d.—Sec. of R. G. S. to Dr. Lindley, transmitting the Queen's copy of the drawings, and requesting him to superintend the publication of the flower, and a correct description of it. Also stating, that the Queen had been pleased to accept the dedication of it, and to signify Her pleasure that it should bear the name of *Victoria Regia*, if, as believed, the flower should prove to be an undescribed genus.

Thus it is manifest that Mr. Gray's statement is a tissue of mistakes; as he has, indeed, been subsequently obliged to admit in the "Annals of Natural History" for December last. 1. The plant received the name it bears, by Her Majesty's permission, before Mr. Schomburgk's drawings were even in the hands of the Botanical Society. We may add, that it was generally known to the Council of the Royal Geographical Society, and to the numerous visitors that called to see the drawings within the first fortnight, by the name of Victoria Regia, and by no other; and that, consequently, Mr. Gray might have informed himself of that circumstance had he made any inquiry, as we think he was called upon to do, before he ventured to make public a document which the Botanical Society had been officially informed was forwarded by a traveller "entirely under the control and at the cost of the Geographical Society,"—a tolerably intelligible, although courteous hint, which most men would have known how to receive. 2. That the Editor of the *Athenæum*, in changing the words Victoria Regina to Victoria Regia, in the Index of the year 1837, did not commit "an error of the press," but silently corrected one, by employing the name which he, as a well-informed man, knew was that by which the plant would be in future called. Possibly, too, as a scholar, he saw the absurdity of the name Victoria Regina. 3. That Mr. Schomburgk's papers did not "find their way into the hands of Dr. Lindley," as Mr. Gray pretends, but were officially communicated to him for the express purpose of publication, and by the only Society which had any property in them. 4. That the Geographical Society could scarcely have afterwards borrowed drawings which they already possessed, and most certainly did not do so, if they borrowed them at all, for any such purpose as Mr. Gray asserts.

But Mr. Gray's inaccuracy does not terminate here. He says, that Dr. Lindley adopted his view, that the plant forms a genus intermediate between Euryale and Nymphæa; and in support of this assertion he quotes the "Botanical Register" for 1838, p. 11. But if the reader will consult that work, he will find nothing of the sort. Dr. Lindley's statement, before examining the plant personally, and judging merely from Mr. Schomburgk's drawings, was this:—"This noble plant corresponds with the genus Euryale in the spiny character of the leaves and stalks, and to a certain extent in the great development of the former organs; but it is, in fact, most nearly related to Nymphæa itself." At p. 12, where the result is given of an examination of some decayed flowers, it is stated that "Victoria is quite distinct from Euryale;" and the whole of the succeeding observations are made for the purpose of showing that Victoria is very different from Euryale; the last words of the little dissertation referred to being these—"notwithstanding a *primâ facie* resemblance to Euryale, Victoria is, in fact, more nearly allied to Nymphæa."

So much for Mr. John Edward Gray. Another proposal, made by Mr. Sowerby, to change the name of Victoria regia to that of V. amazonica, because it now appears that the plant was originally called Euryale amazonica, we do not think worth serious consideration. *Paxton's Flower-Garden for January.* [In order to save room, we have condensed Mr. Gray's charges, omitting what is irrelevant, and in like manner have shortened the *précis* of the correspondence.]

*Exotic Nursery, King's-road, Chelsea.*—We understand that Messrs. Knight and Perry gave the annual festival to all who are employed in their establishment, on Tuesday last, when, after regaling themselves from a bountiful supply provided for the occasion the evening was spent in great sociality.

## Calendar of Operations.

*(For the ensuing week)*

GENERAL REMARKS.

From now until the end of February is the most trying period to tender plants, placed throughout the winter and spring in pits and frames, to be preserved for the summer decoration of the flower garden, the beauty of which so much depends upon their being brought carefully through the trials that now await them, that too much attention can scarcely be paid in guarding them from excess of cold and damp. This is not the time to discuss the best way of wintering tender plants, as every one who has any to preserve, will have put his favourite or most convenient plan into use long before this. The great point to aim at now, is, to take care that no injury comes to the stock; and that whatever plan has been adopted, it be made to answer by strict attention and diligence in preventing the plants from suffering by frost, or damping off for want of air. Every opportunity should be seized to admit light and air to the inmates of all pits and frames, and to pick off every leaf that shows symptoms of decay, before the evil is communicated to others. Should severe frost continue for several days, so that no light or air can be admitted to cold pits containing such plants as Geraniums, Calceolarias, Petunias, &c., be cautious in uncovering after the frost goes, lest the too sudden exposure to the action of light should prove injurious to them. Remove the greater part of the covering first, leaving a little to shade the plants for a few hours, while air is admitted by tilting the sashes an inch or two at the back, which will enable them better to endure the sudden change from total darkness to a bright light. In giving water, much caution should be used not to cause more damp than is unavoidable inside the frame or pit, as the drier both it and the covering material is kept, the less will frost be attracted, and the healthier will the plants continue. The kitchen garden frames which are occupied with Salads, Cauliflowers, early Radishes, &c., should also share our attention; and every means we can devise should be put in practice to ensure the safety of these useful plants from slugs, and from the mould and damp, so apt to result from long confinement. The ashes of garden refuse, prunings of shrubs and hedges, or any consumable matter, sifted fine and sprinkled among young Lettuces or Cauliflowers, will

can only dry up damp, but snails and slugs will be made uncomfortable by its adhering to them, and these ashes are very fertilising. Many operations can be carried on during frosty weather with much greater facility than when the ground is soft and wet. Manures, fresh soils for reinvigorating exhausted compartments and fruit borders, and draining materials where required, can all be conveyed to their places in a much more handy and cleanly manner while the surface is hard. By forethought and activity much may now be done to forward the work of a garden, and all the hands can be fully employed even in the severest weather. Pruning the hardier kinds of fruit-bearing plants, as Gooseberries and Currants, and dressing and tying Raspberries, may be safely carried on during frost; and if snow falls so as to prevent out-door work, there will be a host of things to be done in-doors, such as making brooms, preparing flower stakes, tallies, &c. In the plant department, Orchid baskets may be made, trellises painted, crocks broken and sorted, and soils got in while in a frozen state, by which insects and their injurious larvæ are destroyed; besides a great variety of other things which may be put in readiness for the busy time of potting in the spring.

### PLANT DEPARTMENT.

The principal thing to be attended to in this department during the present month is to keep the plants perfectly free from decaying leaves and insects, and to avoid excess of heat and moisture during dull weather; but whenever there is a clear day, take advantage of it to increase the temperature a few degrees, accompanied with more air, by which the plants will be much invigorated. Avoid watering until you can moisten thoroughly the whole of the soil in the pot; and endeavour to keep a moderately dry atmosphere about all plants at this season. Although it is not a common practice to pot plants at this dull period of the year, yet, in many cases, it may be done with advantage. We find that Heaths, and many other plants which grow throughout the winter, do well when potted at this season; and we make a practice of potting all plants that require it, when they have done flowering and have begun a new growth, be the season what it may. Now is a good time to turn the heaps of soil collected during the autumn, as many insects will be exposed and destroyed by the frost; and, if after being turned, the frost continues until a crust is formed, some of the soil may be taken in this state into the shed, as it will then be quite free from insects. Sphagnum for Orchids should be collected and laid out thinly upon a clean spot, that the birds may pick the larvæ of insects out of it. The action of frost will also be of service in destroying them; and its sweetening influence will render the sphagnum more genial to the roots of the Orchids. Orchid baskets of various sorts, and blocks of any kind of durable wood, should be prepared; that when the work of shifting the plants and cleaning the blocks commences, all may be in readiness. Stoves should range from 50° to 55° at night; intermediate houses, 41° to 50°; Geraniums and soft-wooded greenhouse plants, 38° to 43°; New Holland house, the same; Heath-house, 32° to 38°. The day temperature should range from 5° to 15° higher, according to the amount of light. The practised eye will readily detect any little alterations that are required, such as removing to the warmer end of each house those plants which are a little more delicate in constitution than their neighbours, or which, from various causes, require a more favourable situation.

CONSERVATORY.—As soon as any of the flowering plants becomes shabby in appearance, they should be removed out of the way, to make room for others which are coming into flower. In arranging these, let the situation of each be suited as much as possible to the nature of the plant; some kinds preferring a shady situation, and *vice versa*. With regard to temperature, also, some require to be placed in the warmest parts of the conservatory, while others will be satisfied with a simple protection from frost.

### FORCING DEPARTMENT.

PINERY.—The fruiting pits should be kept from 55° to 60° by night, and 65° to 75° (or 85° by sun-heat) during the day; bottom-heat 80°. Admit as much fresh air as possible, moderating the quantity when the wind is very keen. The day temperature and the moisture should be regulated by the clearness of the weather, and the amount of air which can be admitted. Crownless and deformed fruit are the result of moisture being allowed to accumulate in the hearts of the plants, at the time the fruit is coming up; be careful, therefore, to avoid drip or syringing. Where the pot system is practised, the plants, in all stages, should be examined once in two or three weeks, and a portion of those whose roots have made the greatest progress should be repotted. VINERIES.—After washing the Vines and glass, the woodwork and everything else about the house should be painted, if necessary. If the outside border is not already covered, this should be done before the Vines are started. Apply about 18 inches of fermenting material, such as stable litter, and leaves, to produce a gentle warmth in the soil, before the inner temperature is raised higher than 50°; previously to which, all loose or exhausted soil should be scraped off the border, as far as the roots, and replaced by a top-dressing of charred turf, crushed bones, charcoal, and fresh horse-droppings. The inside border should also have the exhausted soil removed, and be top-dressed with a similar mixture. Commence with a gentle heat, of from 45° to 50° night temperature, and from 50° to 60° by day. The amount of moisture should be moderate at first, and increase gradually, as the buds advance in growth. Syringe freely in fine weather, and admit air daily after the swelling of the buds is observed, or weakly shoots will be the consequence.

### FLOWER GARDEN AND SHRUBBERIES.

In many damp low situations it will be found better to have the pits in which half-hardy plants are kept heated with 2-inch hot-water pipes; and as these enable us to dispense with mats or covering of any kind over the glass, they will be found on the whole to be not only the best but the cheapest. Where these are in use, care should be taken not to render the plants too tender by excess of fire heat. If the frost is excluded, it is sufficient; and air should be admitted on all favourable occasions; while, if the weather is mild and dry, the lights may be entirely drawn off for an hour or two in the middle of the day.

### FLORISTS' FLOWERS.

January is quite soon enough to put Dahlia roots in heat, in order to obtain a great stock of plants, yet some begin thus early. Nothing is so well adapted for this purpose as a small house, with a hot water tank. We would advise those whose roots have been stored in cellars, and similar places, to examine them, and it will be highly beneficial to bring them out, and expose them to the wind on fine drying days. The trouble is not much, and it may save great disappointment. After frosts, look well to all florists' flowers planted in beds, such as Pinks, Pansies, &c. &c.; they are often raised. Those in frames will require picking over, the dead leaves removing; Pinks and Carnations are peculiarly liable to be affected with a black mildew; this, if not removed, will spread to others. It will be best that all affected plants should be kept in a frame by themselves. We have tried dustings with sulphur, and with beneficial effect. We doubt not that the contrivance now in use for discharging powdered brimstone over mildewed plants would be extremely useful to the florist.

### KITCHEN GARDEN.

The most economical method of forcing French Beans is to grow them in a bed of soil, in a pit which has the advantage of being heated at pleasure, both top and bottom, by means of hot-water pipes. The best way of proceeding is to fill the frame to within 12 inches of the glass with fermenting materials, and upon this to lay 9 inches of rich loamy soil. The seeds should be sown in drills longitudinally, for as the surface of the soil will be upon the same incline as the glass, the plants will not shade one another so much as if in rows transversely. As the plants increase in size the fermenting material will gradually sink, and when the heat thereof begins to decline, it can be sustained by means of the hot-water pipes. A sowing of Lettuces and Radishes should be made on a warm open border facing the south, and covered with a little dry Fern, which should be drawn off with a wooden-headed rake during the day in fine weather. The early crop of Radishes in frames will now be progressing, and the sashes should be removed for a few hours every day when the temperature is above 40°. Let them be thinned out sufficiently to prevent their injuring each other. A sowing of Radishes, Lettuces, Cauliflowers, Celery, and a little early dwarf York Cabbage will come in early, if made under a south wall, where a covering is used for the protection of Apricots or Peaches. Some Peas of an early kind, and a few Mazagan Beans, may now be sown on an early border, taking care to prevent mice from destroying the seeds. Sowing a little chopped Furze or malt screenings in the drills will be found useful for this purpose.

### HARDY FRUIT GARDEN.

If Apricots are not already covered, it should be done as soon as possible, for their flower-buds are injured by frozen sleet much sooner than is generally believed. A recurrence of such a season as the last, when many fine trees were killed by the severity of the spring, would be unfortunate; and as it is quite possible, every available means should be adopted to ward off the effects of cold and wet. As Apricots are more tender than Peaches or Nectarines, it is my practice to cover them early in winter, by placing very thinly amongst the shoots, as soon as they are trained, some Spruce or Yew branches; and over these a canvas screen, which is readily rolled up or let down by means of lines passing over pulleys, fixed in the face of a 6-inch projecting wooden coping. The object of using the Spruce and Yew branches is to prevent the injurious effects of cold currents of wind, which often sweep along between the wall and the canvas; one of the greatest advantages arising from the use of the latter is in keeping the trees dry.

**State of the Weather near London, for the week ending Jan. 2, 1851, as observed at the Horticultural Garden, Chiswick.**

The annual amount of rain at Chiswick, on an average of 25 years, is 24 inches; consequently the amount in 1850 is nearly 5½ inches below the average; 1847 was the driest year in the present century.

## Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE: The publisher begs to say that the following may be had. Any subscriber who will forward postage stamps equivalent to as many numbers as are required, will have them sent free by post. The volumes for 1847, 1848, 1849, and 1850 are now ready, price 30s. The volumes of former years are out of print.

1841—1, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 45, 46, 47, 48, 51.

1842—1, 2, 4, 6, 8, 11, 13, 14, 15, 16, 17, 18, 19, 20, 23, 24, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 41, 42, 43, 45, 46, 47, 48, 49, 50, 51, 52, 53.

1843—3, 5, 6, 9, 10, 11, 12, 13, 14, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52.

1844—All, except 46.

1845—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 13, 14, 15, 16, 17, 18, 19, 20, 21, 23, 25, 26, 27, 28, 31, 32, 37, 39, 40, 41, 42, 44, 45, 50, 51, 52.

1846—4, 5, 6, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 23, 24, 26, 37, 42, 43, 46, 49.

1847—1, 2, 3, 4, 5, 6, 8, 13, 14, 16, 19, 20, 21, 22, 27, 28, 29, 32, 33, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52.

1848—2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 33, 34, 36, 37, 39, 40, 41, 44, 45, 48, 51, 52, 53. 1849—All. 1850—All, except 41.

BIRDS: *L J W*. A lady who has had one of the birds you mention, for some years, has favoured us with the following answer: "The widow-bird is the Whydak bird, or bunting of Paradise. If resembling the specimen in my possession, it is by no means delicate; the warmth of an ordinary sitting-room is sufficient, with a shawl or something thrown over the cage at night. It lives on millet and canary-seed, but chiefly millet. In the winter it loses its long black tail, and the whole plumage changes to a dull speckled brown; in May it begins to resume its jetty and golden hues. Sometimes it appears to suffer much pain and inflammation in its legs and claws; the scales come off, but are resumed with the summer plumage. It is particularly fond of bathing, and likes plenty of fresh water; the bath should be changed two or three times a day; its song is very wild and peculiar, but pleasing; it is very fond of fresh Grass, the only green food it will eat."

CARROTS: *G L H*. It is a very curious case, and we should wish to draw attention to it. Are the roots *really* grafted together? Is there no possible deception? If the monster is indeed what you suppose, then it would be well worth sowing the seeds. We know of no similar case.

CHALK DOWNS OF HANTS: *C D*. You shall have a list of fruits next week. We have no experience of the suitability of Mexican Pines for such places, but they deserve a trial. Evergreen Oaks, certainly; Tree Box, Phillyreas, Alaternus, Turkey Oaks, Hornbeams, &c. We do not know whether Taxodium is poisonous; probably not; at least it is not sufficiently allied to the Yew to merit an unfavourable opinion. Stone Pines, Silvers, Balm of Gileads, Pinus austriaca, and uncinata are worth trying; as also are the Laricio and Pinaster, with P. halepensis, and Brutia. You would do us quite a favour if, in putting questions, you would have the goodness to write them on one side the paper, only.

CONIFERS: *Gallicus* will find that his inquiry was answered the week it was received.

HEATING: *J C*. A lecture-hall of glass and iron might be constructed cheaply on the Paxton plan; but it should not be circular: it should be either a square, or two squares side by side, or any other number of squares. It might be heated by hot-water pipes like any other place. The glass should be white.

NAMES OF FRUITS: *W Ross*. 1, Blenheim Pippin; 2, Round Winter Nonsuch; 3, Hughes's Golden Pippin. The Pear is Passe Colmar.‖

NAMES OF PLANTS: *C T—s*. Veronica salicifolia. There is nothing worth notice in the Fuchsia.—*H F Thompson*. It would save us some trouble if you would have the goodness to say whether the plant requires a hothouse, greenhouse, or what; and whence it was obtained, if you happen to know.—*R E*. A bad variety of Vanda suavis.

SMOKY FLUES: *A Z*. Smoke oozing from their sides in a pit where Fuchsias and Pelargoniums, &c., are kept, will be likely to injure the plants, even although there is very little. Cannot you stop it by parging? rebuilding the flue would be expensive.‡

VINES: *Anxious*. If their wood is *perfectly* ripened, they will not be likely to receive much injury from being turned out of doors; but if it were convenient, we should certainly prefer permitting them to remain in the house.‡

WOOD SEASONING: *J Fleet* We are making inquiries.

THE LONDON MANURE COMPANY beg to offer as under:
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.
The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 33, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.
Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.
E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

# The Agricultural Gazette.

*SATURDAY, JANUARY* 4, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| WEDNESDAY, Jan. | 8 | Agricultural Society of England. |
| THURSDAY, — | 9 | Agricultural Imp. Society of Ireland. |
| WEDNESDAY, — | 15 | Agricultural Society of England. |
| THURSDAY, — | 16 | Agricultural Imp. Society of Ireland. |

BEFORE entering upon the drier and minuter details of the subject of FARM ACCOUNTS, we think it may be right to make a few observations on several matters connected with it. We believe, that without accounts, the proceedings of any one, whatever may be his engagements, whatever his business, must be a matter of chance speculation, and even then that the chances are entirely against him, because he is progressing in the *dark*.

We never yet knew a man who became, as it is termed, "unfortunate in business," but upon the investigation of his affairs, his books were found badly kept—or suffered to get "behind-hand," or perhaps no books were kept at all: had they been duly attended to, what was there to prevent his circumstances being thoroughly known, and a stop being put to many of his ruinous speculations, and also a due estimate made of those that were profitable. What must we say to the merchant who conducts his tradings in the manner described? the mildest term must be *foolishness*, and yet how many do so—and perhaps amongst the agriculturists the instances are more numerous; indeed, we must express our belief that often a farm is conducted without accounts at all: that is, any such accounts as can truly bear the name, many thinking "that what slips out of the kneeband falls into the boot." That is not enough—every farmer, like the merchant, should know positively the profit or the loss on every mode of cultivation, on each sort of grain, stock, &c., otherwise (in many instances it has been proved) he is pursuing his ruin; so careful indeed would we be — perhaps by some we may be laughed at for "splitting straws"—that we should recommend, in addition to the exactness required on the land, as careful an account to be kept of housekeeping, because, generally speaking, the farmer consumes, if with a large family and establishment, a considerable portion of his produce, and, when placed to the proper sources from which the consumption was derived, it would therefore form a no less item of *profit*.

It will not be out of place if we mention another source of profit or loss, as the case may be, in the cultivation of a farm—we refer to the amount of capital employed. If the moneys employed are too little to meet all the requirements without a pressure, that pressure will oblige the farmer to neglect his culture, or to force sales at a great disadvantage, or perhaps do that which is more ruinous still, viz., borrow money at a rate of interest, perhaps greater, with the expenses attending it, than the average profits of the farm; when, on the other hand, if he employs a larger capital than is necessary, that very capital becomes a clog, as the land must be charged for the interest of the capital employed, and if nothing worse is the result, it changes the farmer into a speculator, and the meaning of that word, surely, points out to everyone that the chances of success cannot be so certain.

In pursuing our subject, we propose to ourselves the task of framing a system, and conducting the accounts through the period of one year; viz., from Michaelmas to Michaelmas—the extent of the farm to be 100 acres of arable, pasture, and woodland, in order that as much as possible every circumstance may be embraced in which a farmer can be placed. At the same time we must observe, that although we have fixed on 100 acres as the extent of our farm, we are perfectly aware that, under ordinary circumstances, such an acreage would be cultivated at proportionally a much greater expense, as the number of horses, implements of husbandry, &c., must be sufficient to meet every requirement; whereas, if the farm were 500 acres, those items would not have to be, perhaps, more than four times the number. But this circumstance is not for us minutely to consider. Our system will be the same, yet we deem it right to bring this matter before public notice, in order that we may not be misunderstood. We shall not presume to teach the farmer how to make the most from his land, but simply how he is to keep his accounts, and by them to discover that system which will best remunerate him for his skill and labour.

From the circumstances of a residence in Essex—having witnessed the modes of cultivation there pursued, more than in any other county—we shall consider the farm situate in that county. Of course the nature of occupation, whether under a lease or not, whether under a corn rent, or otherwise, in the *present* case, is of no importance to the discussion of the subject before us. No doubt it does, to a great extent, influence the farmer; for, in the one case, he is induced to farm with a "free and open hand," and the system pursued is both better and more profitable; whereas, in the other hand, he fears to calculate beyond the one year.

It may be right, ere we close this somewhat lengthened introduction, to enter upon one subject more, with reference to this 100 acres: on the amount of capital required for its proper cultivation, there may be some difference of opinion, as some farmers (according to their views of farming) consider 8*l.* per acre sufficient, some 9*l.*, some 10*l.* Each may be right in his estimate, as the nature of the soil will necessarily greatly influence these opinions; but perhaps 10*l.* per acre will be the safest amount both for landlord and tenant; and throughout our calculations we shall consider it so, and name the capital employed, 1000*l.*

Having thus prefaced our subject, we shall, in our next communication, in another section of this Journal, inform our readers that we have hired our farm; — that a valuation for incoming has been effected; that we have taken possession, and have commenced operations, the nature of which we shall endeavour to render as clear as possible. *F.*

## THE DRAINAGE ACTS.

AN anonymous correspondent, describing himself as "An Assistant Commissioner under the Acts," has, in page 811—No. 51, 1850—made an attack upon his official superiors, for their administration of the provisions of the Drainage Acts. I believe that attack to be altogether unwarranted, for I happen to know that it is a rule at the Inclosure Office, that no assistant commissioner shall be allowed to act as inspector upon any lands in which he may be interested, either as proprietor or agent, or as a contractor for the works to be performed; and in my experience of the carrying out of the provisions of the acts, which, I daresay is not less than that of your correspondent, I know of no instance in which this rule has been broken through; I therefore make bold to assert that, upon further inquiry, your correspondent will find that he has been misinformed; and trust, that for the credit of your excellent Paper, he will at once either withdraw or substantiate his charge, by naming the party, who, holding the appointment of steward, has been allowed (the commissioners being cognisant of such connection between the parties), to act as assistant commissioner for the works executed under the provisions of the Drainage Acts, on the lands of his employer. Again, as to "office expenses turning a very pretty penny for somebody or other," as your correspondent phrases it; if he really be what he styles himself, he ought to know that there are no office expenses which can by any possibility benefit any person there; that, in fact, the only expenses required by the office, are repayments of sums paid out for advertising, as required by the act, &c. It is an unavoidable evil that some of the expenses are as great in the case of an application for a few hundreds as a few thousands of pounds; and also that the expense of inspection is not materially less, especially if the money be required in small portions; but your correspondent has shown that inspection cannot be dispensed with; and it must be borne in mind, that the advice of the inspector is worth something to the individuals draining under the acts; indeed, in some cases a great deal, as for instance, in one case within my own knowledge, where it seems probable it will be the means of saving 500*l.* on one single application. I cannot at all see what the tax-paying portion of the community have got to do with the Drainage Acts in their capacity of tax-payers, as they certainly cost them nothing, and your correspondent is not likely to find many adherents among the landed interests; for they one and all seem highly pleased with the measures and their administration; and in truth they have no cause to feel otherwise, for the measures themselves are affording the means of greatly improving their estates, at a very small cost, without any trouble with titles or law, and it is well known that no public board has more anxiously endeavoured to carry out cheaply and well the measures entrusted to it than the inclosure commission has in the instance in question. I would not have noticed your correspondent's remarks at this length but for the fictitious importance they acquire by obtaining a place in your widely circulated Paper. *John Girdwood, Chirk, North Wales.*

## EXPERIMENTS ON CULTIVATION.

IT is the more necessary to communicate to you the results of my agricultural experiments this year, because they in some degree contradict my former experience, and disappoint the expectations which theory seems to authorise. On the disputed question about the best quantity of seed to be sown for a crop of Wheat, I have hitherto found it about the mean between four pecks and ten; this year the evidence is in favour of the smallest quantity. In order that the effects, whatever they might be, should not be attributed to the mode of cultivation, each experiment was conducted in three different ways; part was broadcast, part dibbled, and another part was dropped by hand after the presser had formed its well consolidated lines; in a wet season this is a good method of avoiding the inconveniences of the dibble, which in a retentive soil forms cups, that hold the water and exclude the air, till the seed is rotted; it is moreover more expeditious, and forms an equally firm seed bed. The last season, however, did not require such precaution, and perhaps from the absence of wet, the pressure of the dibble was more effective; certain it is, that the produce was inferior to the other.

| | Corn. | | Straw. | | Average of Corn. |
|---|---|---|---|---|---|
| | bsh. | gal. | Trusses. | lbs. | bsh. gal. |
| 4 pecks per acre sown broadcast | 32 | 4 | 108 | 32 | |
| 4 do., dibbled ... ... ... | 32 | 4 | 116 | 24 | 31 5 |
| 4 do., dropped ... ... ... | 30 | 0 | 103 | 12 | |
| 6 do., broadcast ... ... | 25 | 0 | 62 | 8 | |
| 6 do., dibbled ... ... ... | 31 | 2 | 108 | 32 | 27 7 |
| 6 do., dropped ... ... ... | 27 | 4 | 62 | 8 | |
| 8 do., broadcast ... ... ... | 22 | 4 | 69 | 24 | |
| 8 do., dibbled ... ... ... | 30 | 0 | 97 | 28 | 26 5 |
| 8 do., dropped ... ... ... | 27 | 4 | 80 | 0 | |

It may be observed that in the two last trials the broadcast produced less than either of the others, and in the first, though it was on a par with the dibbled in point of grain, it was inferior to it, where it might be supposed to have the advantage—in the quantity of straw; but it is more to my present purpose to observe, how much the average quantity of corn is diminished in proportion as the quantity of seed is increased; and this can scarcely be the effect of accident; for it is confirmed by another series of similar experiments, the results of which so nearly coincide with these that it is needless to occupy your columns with the particulars, but a greater quantity of seed was tried, and it may be a warning not to be too precipitate in drawing conclusions from a limited set of experiments, when it appears that if only 6, 8, and 10 pecks had been tried against one another, the evidence would have seemed in favour of thick sowing; for in the last case the average was 28 bushels; higher, that is, than either of the others, but when compared with the produce of the thinnest sowing it falls below it by nearly 3½ bushels, which added to the difference in seed makes up a loss of almost 5 bushels per acre; another series of experiments was intended to show whether a variety or increase of food to the plants would materially affect these proportions. The fertilisers used were guano, phosphate of potash, sulphate and muriate of ammonia in different proportions; but they all tell the same tale—all increased the produce, but the amount of that increase observed much the same proportions.

The average from 4 pecks was 34½ bushels.
" 6 " 32¾ "
" 8 " 30 "
" 10 " 31¼ "

Nevertheless, when the experience of one year contradicts that of several, and not only in one locality bu

generally, it is obvious that some peculiarity of the seasons must have been the cause; and in point of fact, the preceding autumn was very favourable; there was not too much wet for the seed, or for the young plant, and it suffered less than usual from the winter. If it were sure that it would always escape the disasters which commonly befall it, and the same number of plants always survived the winter, four pecks of seed, or even less, might possibly suffice, but it would be folly to act upon that calculation, till it can be shown that such seasons may be taken as the rule and not as a rare exception; and that besides the weather, all the living foes arrayed against the crop—insects and slugs and worms and birds, will not claim for themselves more than half of that which the cultivator hopes to reap. If it be asked, how it happens that under such favourable circumstances the actual yield of corn per acre is so much less this year than it was the last—less by several bushels—the answer is one among many proofs, how much the presumption of imagining that the course of nature can be controlled by any amount of skill or expence, is rebuked by Him who directs its arrangements. Never was there a greater promise of abundance; but just at the critical period, when the Wheat was in blossom, it was beaten down by thunderstorms, and the thickest and heaviest crops had the least power of recovering themselves, and the ears were blighted or only half filled.

Of all the ingredients detected by chemical analyses in the structure of Wheat, two of the most important aids to increased fertility are nitrogen and phosphoric acid; in order to obtain enough of the former for one extra bushel of Wheat above the ordinary produce, it has been proved that 5 lbs. of ammonia must be added to the soil; and so many pounds of the latter are taken away from it every year, in the shape of grain or mutton, and not returned in farm-yard manure, that it seems reasonable to fear that in land long under cultivation, the natural supply of it must be quite exhausted. Hence it would appear that Mr. Solly was quite justified in asserting that phosphate of ammonia is a most valuable manure, since it contributes the two ingredients most needed for the increased development of the plant. I will not say that the experience of this year has proved the contrary, because, not having examined the article sold under that name before it was used, I cannot be sure that it was the genuine salt; certain, however, it is, that it has appeared to be almost entirely inert. It increased the quantity of straw a little, but the quantity of corn not at all; moreover the salts of ammonia are usually beneficial to Grass land; but there too the phosphate has failed, and it is not only in this combination that phosphoric acid has disappointed me. Combined with another base, most essential to vegetation—potash, it was equally inactive; and when mixed with some other manure, the effect was no more than might be expected from that other, if it alone had been employed. Nevertheless it must be remembered, how much uncertainty attends all these experiments; the same facts must be repeatedly verified, to clear them from the suspicion of arising from accidental causes, and it is only a long experience that can be taken as the test of truth; for it will be seen from the following statement that if too much reliance were placed upon a few partial experiments sentence of condemnation must be passed upon some of the most approved fertilisers.

| | Corn. | Straw. | Cost. | Loss, per acre. |
|---|---|---|---|---|
| | bsh. gal. | Trs. lbs. | £ s. d. | £ s. d. |
| 240 lbs. of Peruvian guano | 32 4 | 122 8 | 1 1 5 | 1 1 5 |
| Without it ... ... ... | 32 4 | 108 32 | | |
| 1 cwt. muriate of ammonia | 31 2 | 111 4 | 1 2 0 | 1 2 0 |
| Without it ... ... ... | 31 2 | 105 21 | | |
| 1 cwt. guano+1 of muriate of ammonia ... .. | 25 0 | 105 20 | 1 12 0 | 1 12 0 |
| Without it ... ... ... | 25 0 | 62 8 | | |
| 160 lbs. guano+80 of muriate of ammonia ... .. | 32 4 | 80 0 | 1 10 0 | 1 10 0 |
| Without it ... ... ... | 32 4 | 69 24 | | |

Some deduction must be made from this statement of loss, on account of the increase of straw, which in some cases was very considerable, and in one where the phosphate of potash was combined with muriate of ammonia, amounted almost to double, but still it has an aspect of great discouragement towards experiments; and yet it would be a great mistake to be discouraged from making them; for after deducting all the expenses and losses of 27 experiments, there remains a balance of profit in their favour to the amount of five guineas. I will only further add upon this subject, that if the inactivity of manures consisting of ingredients most necessary and most apt to be deficient is to be accounted for on the principle that the earth already contains them in sufficient abundance, and if there is no reason to suspect that any others can be deficient, we are driven to acknowledge that there are conditions of soil which prevent it from producing more than a certain maximum peculiar to itself, and which cannot be corrected by any applications of art, for in these chalk soils no drainage is required. There is, indeed, a mode of improving its texture, which I still persist in recommending, where it is not all too stiff, and which may be practised with great advantage wherever there is plenty of wood or other fuel. By burning the whole surface of one-half of a field, it bore last year an excellent crop of Turnips, without the aid of farm-yard dung; and this year it has produced 10 bushels of Barley and 13 trusses of straw more than the other part which received 18 loads of farm yard manure. But if some of the opinions which I had previously entertained have been much shaken by these experiments, there is one at least which has been confirmed by them, and one which is very intimately connected with the preceding discussion. It is not the first time that I have endeavoured to show how much we are apt to overdose our land with some favourite manure, and to forget the old adage, that "too much of anything is good for nothing." The following instances illustrate this:

| | Hay. | |
|---|---|---|
| | Tons. cwt. lbs. | ——— s. d. |
| 276 lbs. of guano on grass produced ... ... ... ... | 1 12 76 | loss 11 2 |
| The adjoining land unmanured | 1 9 12 | |
| 224 lbs of guano ... ... ... | 1 10 60 | ,, 3 3½ |
| Adjoining land ... ... ... | 1 6 8 | |
| 140 lbs. of guano ... ... ... | 1 10 0 | profit 15 7½ |
| Adjoining land ... ... ... | 1 2 56 | |
| 112 lbs. of guano ... ... ... | 2 9 12 | ,, £1 12 10½ |
| Adjoining land .. ... ... | 1 18 24 | |
| 112 lbs. of muriate of ammonia | 1 11 8 | loss 6 3 |
| Adjoining land ... ... ... | 1 6 8 | |
| 86 lbs. of muriate of ammonia | 1 10 110 | ,, 0 4½ |
| Adjoining land ... ... ... | 1 6 8 | |
| 56 lbs. of muriate of ammonia | 1 12 46 | profit 7 3 |
| Adjoining land ... ... ... | 1 7 16 | |

The benefit derived from these manures was obviously in the inverse ratio of the quantities employed; and while all increased the growth of the Grass, they could not stimulate it beyond a certain point, and therefore the larger proportions did not repay their cost; but here again I must repeat what I remarked before, that notwithstanding several failures, that system of manuring answered well, for in summing up the results of 16 experiments on Grass, the gain exceeded the loss by 3*l.* 15*s.* 6*d.*; and it is a comfort to know, that the phosphates and ammonia which appear at present to be useless, will not be carried away by the winter rains into the bowels of the earth, wherever there is a foot or two of strong soil above the chalk, but are retained by it, and stored for future use, and may improve the pasture for the sheep. My garden experiments this year contribute something to the same conclusion, that production cannot be indefinitely forced, for having ascertained by the experience of many successive years, that in this soil at least (I presume not to lay down rules for others), the hoeing of Wheat is a useful practice, provided that it be not done too late in the spring, and that the soil be well consolidated by rolling or other pressure afterwards, that was no longer to me a subject of inquiry, but the proportions of food that may most advantageously be administered to growing plants is still an unsettled question, and this I proposed to investigate, retaining the six salts which I have always employed—sulphate of soda, phosphate of soda, muriate of ammonia, nitrate of potash, phosphate of potash, and sulphate of ammonia. The four first were tried separately in this way; half of 16 spaces, each of which contained five rows, was watered with the respective solutions in the proportion of 2, 4, 6 and 8 ounces; the other half was sown with seed which had been previously saturated with the solution. The answers to these questions are not quite satisfactory, because it was necessary to burn the annual weeds and the creeping roots on the spots which produced them, since it would have impoverished the ground too much to remove them from it, and they would have propagated themselves too much if they had been dug in; thus some inequalities were necessarily produced on the spots where they were burned. It is remarkable, however, that the seed which had only been steeped in the two salts of soda, produced not only more corn, which might happen if the crop were very rank, but more straw also, than all those which were watered with the solutions. From the nitrate of potash the straw was exactly equal, the corn a little in favour of the solutions. The muriate of ammonia was successful in the two larger doses, but in the two smaller the produce both of corn and straw was less than from the steeped seed.

This communication having extended already to too great a length, I will conclude it with two or three curious facts. Where the sulphate of ammonia and phosphate of potash were applied separately and in combination to equal plots of ground, half of which was sown with good seed and half with bad, the bad seed having its vacancies filled up in the spring by dividing the roots of those which grew, and watering them with sulphate of ammonia, produced 6 lbs. of straw more than the good, and the total was 50 lbs. more than grew on the same ground seven years ago, though it has borne a crop of Wheat ever since, and bore as much corn as it did six years ago, notwithstanding the unfavourable season. That part which has been always hoed, but never manured, except with its own ashes, produces exactly the same as at first. *L. Vernon Harcourt.*

## AGRICULTURAL MEDLEY.

*Thick and Thin Sowing.*—I have for more than 30 years been connected with Wheat growing in Ireland, and it has fallen to the lot of few to try so many experiments on such a variety of soils, in so many various parts of the island, and under such varied circumstances; and the result of my investigations lead me to agree with Messrs. Hewitt Davis, Mechi, and others, who advocate thin sowing as a source of individual as well as of national profit. I will, out of many other cases, give you two that have occurred with myself. One was on a good Wheat soil in the county of Dublin, where from 70lbs. of Wheat "ribbed in," in beds averaging 14 feet wide, furrows 12 inches wide, and 12 to 15 inches deep, "double snovelled," I reaped 20 barrels, of 20 stones each, to each Irish acre; that is, 80 stones produce to each stone sown. The next I will give, was from an Irish acre of Wheat land of good quality in Kerry, where I had 15 barrels, of 20 stones each, from a seeding, broadcast, merely "harrowed in," of 35 lbs of seed, or 120 to one.* The crop in Dublin was of course more profitable, not so much, or, perhaps, at all, because I used double the seed, but because the land was better, and tilled by the shovelling of the furrows in a better manner. I have, since I last wrote to you, sown Wheat in this island with 60lbs of seed to the statute acre, being 4 lbs under a bushel; and from the present appearance of the crop, though on land rather worn out from a previous cropping (bad farming, you'll say, before I tell you that circumstances admitted of no other), I rather think I would have plants enough, though broadcast, for half as much more land. With the result of this crop, and others under other circumstances, you shall be duly apprised, if I am spared †

*Deep and Shallow Draining.*—Like the Wheat growing, I have had much experience in this department, and like many others, had very strong prejudices for some time against the application of deep drains to all soils, and under all circumstances. My prejudices are not yet totally removed, yet they are sufficiently so to make me believe that the deep draining is far preferable, generally speaking, on the great majority of our Irish lands requiring drainage, and, though I am draining lands, here now, which six weeks ago appeared to require none, and where many now would wonder where the water could come from, as little, if any, appears at the depth of 2½ feet; nor is the wonder less on seeing a large supply given out at the depth of 4½ feet. I will, hereafter, when the work is done, give you a more lengthened detail of this operation. I am not surprised at the fact mentioned by Mr. Davis, of the garden pond's drying under the circumstances described, yet he may be a little surprised on my relating a fact that came under my own observation near the railway station at Kildare village, on the Great Southern and Western line. There is, or was, when I last saw it, a little watering pond near the road that crosses the railway to the south-west of the station, within 12 to 18 feet of the railway cutting, in depth, I think not less than the same number of feet. Yet the water remained *in statu quo* in the pond, as neither crack nor fissue appeared to give it vent into the deep cutting.

*Roots in Drain-pipes.*—I once found in a drain 4½ feet deep, a mass of roots which had completely choked the inch and half pipe, though laid but 18 months. These roots were from a Mangold Wurzel crop just removed off the land where they had grown.

*Concrete in the ends of Drains.*—I have repeatedly found wedge-shaped masses of concrete as hard as the mortar found in "the round towers of Ireland," completely shutting in the water. This concrete I suppose must have been formed of the lime held in solution till brought by the water to the end of the drains, and then acted upon by the atmosphere. The remedy against this evil, I find to consist in not allowing any water to settle in the drain, when I could prevent its doing so at the extremity. I, as yet, know no remedy against the entrance of roots into the pipes, except such as would make "the cure worse than the disease." Has any of your readers yet made such a discovery?

*"Irish Moss," as Food for Man and the lower Animals.*—The plant noticed in your last, is, I suspect, not a Moss at all, though in Ireland called by the natives, "Carrigeen Moss," which in English means the Moss of "the little rock," collected on the rocky shores in many places, but more especially on rocks which stretch out into the Atlantic Ocean, on the western and southern coast. I have never known it to be used in this country as a food for cattle. I have never seen it, but in a dried state, sold at a high price in the apothecaries' shops, and have been treated to it in the house of a clergyman in Mayo, 20 years ago, as a most delicate luxury, which it really is, when properly cooked. Having never seen it growing, I can neither describe nor find such a description of it, in either the "Flora Hibernica," or "Irish Flora," as to justify my saying more about it, than to recommend the notice of it to your botanical friends, at this and the other side of the channel. There is another marine plant, found on the coasts of Ireland, called "Dhulse," or "Dhilisk," set down by Doctor Mackay, in "Algæ Rhodospermæ Flora Hibernica," Part 3, No. 6, page 195; and called *Rhodomenia palmata*, which is collected by the poor people, and sold to parties who give it as a treat at fairs and markets. This, with many others of the Algæ, I have known to be eaten by cattle, pigs, and even horses, on the coast, or when collected amongst other marine plants as a manure. Indeed, many of these plants have been, and, I fear, still continue to be eaten by the starving Irish, especially in the southern and western coasts; cheap as are provisions, and heavy as are the poor-rates. Would that our poor people could enter into a commercial exchange with our sea plants, for the Bean meal to whose value you compare the Moss in question. You will now naturally ask, why not grow the Beans ourselves? aye, "that's the rub," which brings me to another subject, namely:

*Bean Culture in Wexford.*—A part of which is, and long has been the best, if not, the only district worthy of the name of Bean growing in Ireland. In the few

* The seasons were peculiarly favourable for Wheat growing.

† I cannot agree in the opinion expressed by a former writer of the great value of the Mummy Wheat. I am trying it again.

remarks on this head, I will confine myself to the immediate locality in which I am situated. The land designed for Bean culture is that in which there had been previously a corn crop ; and sometimes the land selected is meadow or pasture land, "ploughed out of the lea," in September, October, or November, into beds from 4 to 5 feet wide, on which is laid from 10 to 40 tons of farm-yard dung, or compost of sea weeds, road scrapings, &c., to the Irish acre. When this compost is spread on the ploughed land (it is sometimes spread on the land before being ploughed), it is then either lightly covered—or not covered at all—with a couple of inches of earth, either from the furrow or other beds, according to convenience ; the seed then, in November or December, sowed broadcast, at about 20 stones per Irish acre, and covered from the furrows, like to the planting of Potatoes in "lazy-beds," so called, and generally left so, till the crop is fit to cut, the August or September following, when the produce will vary at from 5 to 20 barrels per acre, according to the goodness of the soil, or favourableness of the season. The kind thus grown is called the Wexford Bean, in character something like the winter or Russian Bean, of late introduced into Ireland. I am trying several varieties of Beans this season, under a great variety of circumstances, and will give you the result, if I think it of any importance to any class of your readers at either side of the channel. *Edward Carroll, Beg Erin, Wexford, Dec. 11th*, 1850.

## EXPERIMENTS WITH MANURES IN THE GROWTH OF TURNIPS.

A NUMBER of experiments, for the purpose of testing the comparative values of various manures in the growth of Turnips, were conducted last summer on the home farm at Craigie House, for the information of the St. Quivox Farmers' Club. At the request of Mr. Campbell, I examined the different lots, along with Mr. Smith, Nursery Hall, on the 3d of December ; and the Turnips were then taken up, cleaned, divested of tops and roots, and carefully weighed under our surpervision. And I now have the honour of stating to the club the nature of these experiments, and the results which have been ascertained.

The side of the field on which the experiments were made is well adapted for a comparative trial of manures, as the soil is of a very uniform character. It is naturally poor—the soil consisting principally of a hungry grey sand ; but, under the liberal management of Mr. Campbell, it has been much enriched. Of this there is evidence in the fact that the lot in the experiments which got nothing produced a considerable crop. The usual experience of farmers is that, when there is nothing applied to Turnips in the shape of manure, the return is also nothing. The field, therefore, was in good condition previous to the application of manure for the Turnip crop. There were fifteen lots, each of which consisted of three drills ; and the centre drills of the lots were alone weighed, that the result might not be affected by the influence of particular manures upon any Turnips in neighbouring drills, which might send out their roots unusually far in a lateral direction. Nos. 1 and 2 extend from top to bottom of the field. The other experiments were in small lots of four rods in length ; but they were made with the utmost precision. The drills were drawn 27 inches wide, and the Turnips singled out 12 inches apart. A few plants had been destroyed, and others injured by wire-worm ; but, so far as could be judged from observation, the comparative results were not materially affected by this means, as the different lots appeared to have suffered very much alike.

The first and second lots are the most important experiments. They were manured respectively with dung, preserved under cover according to the dicta of chemists, and various eminent agricultural authorities ; and with dung preserved on an uncovered dung-stead, as is commonly practised. These lots were each manured at the rate of 40 farm cart-loads per acre. The lower part of the field is a heavy clay. We therefore weighed 4 rows near to the foot of the drills, in order to have a duplicate of this interesting experiment. These I shall describe as lots 3 and 4. No. 5 was manured with Peruvian guano, at the rate of 7 cwt. per acre ; 6, with 7 cwt. dissolved bones ; 7, with 25 cart-loads of dung and earth compost, and 3½ cwt. of guano ; 8, with 25 loads of compost, and 3 cwt. of dissolved bones ; 9, with 7 cwt. of M'Call and Co.'s manure ; 10, with 7 cwt. of guano and dissolved bones, mixed in equal proportion ; 11, with 25 loads of compost, and 3 cwt. of M'Call and Co.'s manure ; 12, with 25 loads of compost and 3 cwt. of dissolved bones ; and to No. 13 no manure of any kind was applied. The Turnips on these lots were the green top Swedish variety. Lots 14 and 15 were golden yellow Turnips. The former of these was manured with water docks, and 3 cwt. of dissolved bones ; and the latter with Nettles, and 3 cwt. of the same potent auxiliary. I append the result in a tabular form, stating the weight on 4 rods, or 66 feet, of a drill in each lot ; and likewise the rate of produce per imperial acre. The produce per Scotch acre may easily be ascertained to a nearness, by adding one-fourth to the amounts stated.

| | lbs. | tons | cwt. | qrs. |
|---|---|---|---|---|
| 1 ..... | 159 ..... | 20 | 16 | 2 |
| 2 ..... | 156 ..... | 20 | 8 | 2 |
| 3 ..... | 180½ ..... | 23 | 12 | 3 |
| 4 ..... | 179½ ..... | 23 | 10 | 0 |
| 5 ..... | 194 ..... | 25 | 8 | 0 |
| 6 ..... | 159½ ..... | 20 | 17 | 0 |
| 7 ..... | 171 ..... | 22 | 7 | 2 |
| 8 ..... | 177 ..... | 23 | 3 | 2 |
| 9 ..... | 134 ..... | 17 | 11 | 0 |
| 10 ..... | 176 ..... | 23 | 1 | 0 |
| 11 ..... | 181 ..... | 23 | 14 | 0 |
| 12 ..... | 168 ..... | 22 | 0 | 0 |
| 13 ..... | 47¾ ..... | 5 | 15 | 3 |
| 14 ..... | 190½ ..... | 24 | 19 | 0 |
| 15 ..... | 172 ..... | 22 | 10 | 2 |

It will be observed that the difference between lots 1 and 3, which were manured with dung kept under cover, and 2 and 4, manured with dung kept uncovered, is so trifling as to be practically of no moment. The lot grown on 7 cwt. of guano is much superior to that on an equal weight of dissolved bones, and is the finest in the field—the produce being at the rate of nearly 32 tons per Scotch acre. But again, 3 cwt. of dissolved bones are found to be as good an auxiliary to the dung compost as 3½ cwt. guano. M'Call's manure applied alone is a signal failure ; but it seems to be superior to guano or dissolved bones as an auxiliary. I am not acquainted with the composition of this manure ; but the experiments lead us to suppose that, while some of its constituents are favourable in a high degree to the growth of the Turnip plant, it fails when applied alone to a light soil to sustain the growth during the autumn months, and to produce a bulky crop. The crops of yellow Turnips grown upon water docks, and nettles, with the aid of dissolved bones, are excellent, and point out the propriety of putting to use every description of vegetable matter about the farm.

But the chief feature of interest involved in these experiments is the comparison between the crops grown on farm manure kept under a roof, and those on dung kept in the usual manner. It is an important contribution towards a solution of the question—Whether is it profitable to roof over manure heaps at farm steadings ? It is needless to expect that this point will be settled in the laboratory of the chemist. As in many other things, the farmer must, in all likelihood, find out the way for himself, and the chemist will afterwards tell him why his practice is correct. At a recent agricultural meeting, Professor Way, when asked whether the advantages gained by covering a manure heap were worth the expense, replied that "the question was an unfair one, as he could not be supposed to know what the expense would be ; but as a principle he would say, by all means cover it over, and if they must dilute their heap, dilute it when they wished, and not let the heavens do it for them. Even if mixed with soil, he wished to say that it would be better to cover it." It may as well be said, however, that if the heap must be diluted, in order to keep it in a cool condition, it can in no other way be so cheaply done as by the rains ; and if these should wash out a portion of the soluble fertilising matter, a good tank can be constructed to receive it at far less expense than a large roof ; and besides, we have here a fact, and one fact is said to be worth a number of theories, that the manure kept in the open air at Craigie Home Farm last winter was as valuable for the growth of Turnips as that kept under a roof. The quality may be a little lessened by exposure ; but what remains appears to be, weight for weight, of equal quality. Nor is it likely to lose much if mixed with soil containing a considerable portion of alumina. Professor Way has himself shown, by his admirable discoveries, that such soils possess the power of absorbing and retaining the fertilising properties of manure in so effectual a manner, that no amount of rain will wash them out. With this knowledge it is difficult to discover what great good can result from roofing over a heap of dung mixed with earth. In these times it will not do for farmers to undertake expensive works which may be of doubtful utility ; and it is therefore satisfactory to find that some progress has been made in the accumulation of data, from which a correct judgment may be formed. A few more of carefully conducted experiments to confirm or disprove those of our respected President, will be the simplest way of setting the matter at rest ; for, with all deference to those who guide us to principles, it is facts from the field which will most readily influence practical men, at least so long as the knowledge of these guides is so incomplete that their deductions are frequently found not to be trustworthy. It will probably be found that dung which is exposed to the summer sun loses more rapidly than that which is winter made ; but in the generality of cases at present, the majority of farmers will concur that about almost every farm-steading there are many extensions and improvements remaining to be effected, which are of much more urgent necessity than roofs over manure-heaps. *Reported to the St. Quivox Farmers' Club by James Drennan, Secretary.*

## Home Correspondence.

*Liquid Manure.*—"C. L.," of Cirencester, ought to have had a more correct statement of things before he put the same on paper. The huge brick tower that he mentions is not for liquid manure at all, but a reservoir for water for the mansion and fountains. The quantity and complexity of the machinery cannot be so very great. When a common blacksmith, at 1*l.* and a house a week, has to shoe above 30 horses, and farm work ; can manage the same machinery, with the assistance of two boys at 10*s.* 6*d.*, who were accustomed to attend the pigs and dogs, and have never been five miles from where they were born. "C. L." ought to have enquired what was the nature and requisites wanted. He would have then found that the open sheds were for summering hunters, and that air was required. They are also all boxes and not stalls. The enclosing of these in the winter for beasts, the applying liquid to the already formed heaps of manure, are mere child's play. There is a reservoir of liquid manure, and now comes some of the results from the application of liquid manure—6 quarters of white Wheat to the acre. There is at this present time, on the same field, as good a crop of Mangold and Cabbage as any farmer might wish. Large crops of Italian Grass, and last, though not least, if carried out largely, as Mr. Kennedy, of Myremills, in dry weather, at a cost of 1s. per acre ; the being able to plough and get in the seed directly, thus saving many ploughings at a time, when it is a great object to get in Swedes, and the ensuring of a crop. It is easy to find fault, but truth tells its own tale. I cannot perceive why "C. L." has made such statements, unless he has some underhand object. It is unfair for any person to go round the country to look at farms or machinery, and then, without giving notice to the owner, to insert that which is not true. *J. J. W., Reading.*

*Mangold Wurzel.*—Your correspondent "B. T." seems astonished at his plants not coming up true, and some of them being "runaways." His dressing of 4 cwts. of Peruvian guano per acre was sufficient to make the whole crop run away. We know an instance this season of such an occurrence. Dry weather will "set the plants up," and especially where there is a lack of diligence in having them hoed ; the more attention this crop receives in the early stages of its growth, the more abundant and certain will be the yield. Plants once set up, and especially in strong land, there is little hope of a good crop—sandy loams suit them the best. We generally allow 1 cwt. of guano to an acre, and this mixed with other manure. The same we apply to Swedes, mixed with bone-dust, ashes, and urine. There is no doubt "B. T." might have had true seed in the first instance, but his plants were unquestionably inoculated ; and distance, and the absence of any other variety near him, would be no hindrance to such an occurrence. The above root is becoming more and more cultivated ; it affords an excellent food for pigs during the months of May, June, and July, when other food is scarce. We, ourselves, did not this year get our crops in till the 18th of May, somewhat late no doubt, but it proved the heaviest crop we have ever grown. Two, or three at most, of these ran to seed. Of all varieties of this root, all agree in one thing, that the Yellow Globe surpasses in weight and bulk of crop all other varieties. *X. Y. Z., Hants.*

*Scotch Farming.*—Mr. Pusey's remarkable speech at the annual meeting of the London Farmers' Club, ought to appear in your columns. *M. S.*—We subjoin a portion of it:—They had heard for a great many years, and many gentlemen believed in, the great superiority of Scotch farming to English farming. He believed in it once ; but he knew a little more about the matter now (laughter). Having heard so much about it, he wished to bring it to a test. Some time ago, therefore, he begged the committee of that club to offer on his part a bet of 150*l.*, to back three farms in the eastern counties of England, against three farms in Scotland. There were to be three events ; and he left it to the club to settle the conditions. This was communicated by the Farmers' Club to the Haddington Farmers' Club ; but he was not aware that the challenge had been accepted up to that day (cheers and laughter). There had, in fact, been no answer. Now he should not say one word against Scotch farmers if they only praised each other ; they would be perfectly welcome to do that ; but when they depreciated English farming his blood was up (laughter). He felt that, as being connected with an English journal, the character of English farmers was in some degree in his hands ; and as long as he continued connected with it, he would not listen to that depreciation in silence. Well, the challenge had, as he had stated, been given, and was not accepted. Yet he read in a newspaper, which should be nameless, that a gentleman from the East Lothians who had been travelling in Norfolk, had remarked upon the superiority of Scotch farming to Norfolk farming. Why ? Because, while in the East Lothians land sold for 40 years' purchase, in Norfolk it would sell only for 30. He (Mr. Pusey) would draw the opposite inference. His conclusion would be that the land of Norfolk had been improved so much already, that it could not be improved much more ; whereas the land in the East Lothians having been in a very bad state 100 years ago, had been so much improved, that its value had of late greatly increased. He had travelled in Scotland himself, with a determination to look into the matter, and drove his own horses through 20 or 30 miles a day. He saw along the sea-coast some wonderfully fine deep red land, very well farmed ; but, having horses with him, he left the sea-side and rode up to the hills. There he first found very indifferent farming, then bad farming, and on the tops of the hills no farming at all (laughter). On this subject, as he did not wish them to rely upon his opinion, he would read to them that of an old farmer who afterwards turned politician—the opinion of Oliver Cromwell, who began life as a farmer and grazier at Huntingdon. On the 25th of September, 1650, he wrote thus to the Lord President of the Council: "I thought I should have found in Scotland a conscientious people and a barren country. About Edinburgh it is as fertile for corn as any part of England :" and such was his (Mr. Pusey's) opinion of the land. About 100 years afterwards, Dr. Johnson, who wrote a great Dictionary, and was half blind, and living in Bolt-court, Fleet-street, of course did not know anything about land, wrote from Edinburgh that he never saw finer land in his life. It must have been very good to have struck him. His lamented friend, the late Lord Leicester, said the Scotch must be very much afraid of their

Wheat, as they allowed so many Docks to grow up to support it (laughter). When in Scotland, he (Mr. Pusey) saw a great deal of land that was entirely out of cultivation. He would not pursue the subject. If the Scotch would let them alone, they would let the Scotch alone; but so long as the Scotch went on boasting of the superiority of Scotch farming, he would declare his belief that such superiority was as gross a humbug as was ever palmed by the vanity of one nation on the credulity of another (cheers). The challenge which he had mentioned was still open, and he would be most happy to make the wager, in defence of British farmers.

*Liquid and Solid Manure.*—I have read in your paper of the 14th inst., a letter from "C. L.," of Cirencester, condemning a notion which some people entertain of making their manure in a liquid, instead of the usual solid form; and he ridicules the idea because, in one of his travels, he finds some one has put up expensive buildings and machinery for the purpose of applying it, without stating whether the manure had failed, or even if it had been tried. I have no experience on the subject, but possibly some of your many readers may be able to give theirs. Without the knowledge which trial will give, it would seem that if all the excrements of cattle, both liquid and solid, are collected together in a tank, they will be as valuable in that state, as if they were absorbed and mixed with straw, according to the common custom. It seems a separate question to determine which of the two manures can be most economically conveyed to the soil, though it should of course be settled in any one's mind, before going to the expense of tanks, &c. But does the manure made with straw possess a greater value than it would have if collected in tanks? *A. E. C., Warwickshire.*

*The Drainage Act.*—To the question of, "An Assistant Commissioner under the above Act," "What so preposterous a sum as 34*l.* 5*s.* 10*d.* deducted by the Board for expenses, was for?" I can give no answer. The sum total was merely sent me, and a draft for 365*l.* 14*s.* 2*d.*, the balance. Two inspections only were made, by a person from Devonshire, whose name I forget. My first application, was made thus, "The West of England and South Wales Draining Company," (who did work for me, under the inspection of their own engineer), in October, 1846. The work was commenced, January, 1847, completed, June, 1847, and the sum of 365*l.* 14*s.* 2*d.*, was received by me, October 21, 1848, upwards of 15 months after the work had been paid for. I think, therefore, I have good reason for differing from Mr. H. Davis's eulogistic strain, though, I truly wish, I could instead, join him in it, for the design is most excellent, but, the carrying it out is so troublesome, so much letter writing attendant on it, the charges so exorbitant, and the delay in the receipt of the money so great, (I speak only from my own experience), as to render it totally impracticable for that class of persons, who, among others, most require the assistance, viz., the smaller class of freeholders of this country. *J. T., Swansea, Dec.* 23, 1850. [We hope that any who have had a more favourable experience of of the Act, will be good enough to speak out.]

*Reduction of Rent.*—The Earl of Stair has granted to his extensive tenantry, in Wigtownshire and Midlothian, an abatement of 25 per cent. upon the year's rent, which fell due at Martinmas last (rents are payable in this country at the terms of Whitsunday, 24th May, and Martinmas, 22d November), besides allowing two months after term time to make up the sum. For making this abatement, his lordship has not been led away by mere pity or by fear; the manner in which the boon is to be expended, showing as much wisdom as the amount exhibits of benevolence. In making the deduction it is stipulated that the amount must be expended, before May next, upon agricultural improvements. While this must prove the most profitable manner in which the farmers could invest the sum, it will, at the same time, gladden the firesides of many agricultural labourers, who have of late been but indifferently employed, and the public will be generally benefited. The period in which the boon has been granted, under the foregoing stipulation, is likewise highly seasonable. The present Earl of Stair succeeded to the extensive Wigtownshire estates about 10 years ago, when by the splendid improvements upon his own domain, and encouragement given to the numerous tenantry, a spirit of emulation was excited, which soon had the effect of completely changing the appearance of the face of the district. Such a state of matters continued for some time; but now, owing to the continued depression of prices of all kinds of agricultural produce, although Mr. M'Culloch (of "High Farming" notoriety) and a few others, continue to go on as usual, yet the progress of common spirits had begun to flag. The proposed improvements, however, will set the wheels of industry in motion, and then it is to be hoped will continue until brighter days dawn upon the agriculturists of Wigtownshire. *James Kennedy, South Cairn, by Stranraer, N.B., Dec.* 27*th.*

*Mr. Mechi and his Farms.*—The public, who are thoroughly English in their feelings, like fair play. Mr. Mechi has not had fair play from one of the noblemen at a late agricultural meeting, nor is it the first time his farming has been sneered at, nor his calling as a tradesmen. This last is "the rub." What has a man's origin or his calling got to do with the benefit or good he may confer upon his species? Is the Archbishop of York the worse divine because he is the son of a tailor? Will the duke refuse to go and hear him preach, because he is not the son of a noble? I remember, in Scotland, an old lady would not go one Sunday to Kirk, because the preacher was the son of a hatter in the same town? She was not a lady by birth, and her conduct proclaimed her origin. *Virtus sola nobilitas.* Will his Grace translate this piece of Latin for us landlords? We need not give other examples, as this country can boast of many, *e. g.*, generals from the ranks, admirals from cabin-boys, lawyers from pot-boys, divines from tailors. Mr. Mechi is not assuming in manner; but though he and Mr. Huxtable have wasted not a little money, they have taught themselves something, and, it is to be hoped, many landlords also. *X. Y. Z., Hants.*

*Peat Charcoal.*—A friend of mine has a quantity of it. How shall he treat it so as to get it saturated with ammonia? At present he has some flour barrels, with a few gimlet holes in the bottom, three parts filled with charcoal, into which are poured the urine of the feeding cattle. The liquid after standing for some time in the cask, is drained off, and a fresh quantity poured on. After how long a time or how many saturation of urine will be sufficient to prepare the charcoal? Is this the best or proper method? Can the charcoal be used for top-dressing for Grass or Wheat, or is it best for Turnips? I suppose it must be kept from wet. The charcoal has been prepared, and most satisfactorily and cheaply, in a kiln or furnace rather, used for making small coal into coke; it was burnt for 48 hours, and the peat lost two-thirds of its weight, but not very much of its bulk. Should this same charcoal turn out half so valuable as Mr. Jasper Rogers would have people suppose, the farmers in some parts of this district will be able to supply themselves with any quantity at less than 1*s.* 6*d.* per cwt. *J. L.* [The charcoal may be used so long as the liquid coming through it seems purified by the filtration: and that can be ascertained by sight and smell; or by adding acid, which will make old liquor effervesce if it be not well filtered. Charcoal thus treated will be a capital top-dressing for grain crops.]

## Societies.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND, *Dec.* 6.—The half-yearly general meeting of the above Society was held this day in their rooms, Sackville-street, his Grace the Duke of Leinster, President, in the chair. The Secretary, Mr. Bullen, read the report and statement of receipts and expenditure for 1850, which was adopted. The following is a statement of the receipts and expenses at the Cattle Show at Cork, July 24, 1850:—

| RECEIPTS. | £ | s. | d. | £ | s. | d. |
|---|---|---|---|---|---|---|
| Amount received from local committee, towards payment of prizes at Cork ... | | | | 500 | 0 | 0 |
| Entrance fees from non-subscribers ... | 25 | 5 | 0 | | | |
| By sale of catalogues ... ... ... ... | 24 | 17 | 0 | | | |
| | | | | 50 | 2 | 0 |
| Balance of expenses of show paid by the Society ... ... ... ... ... | | | | 296 | 17 | 7 |
| | | | | £816 | 19 | 7 |
| EXPENDITURE. | | | | | | |
| Amount of money prizes awarded at the Cattle Show at Cork ... ... ... | 598 | 10 | 0 | | | |
| Gold and silver medals ditto ... ... | 30 | 0 | 0 | | | |
| | | | | 628 | 10 | 0 |
| Travelling expenses of judges ... ... | | | | 77 | 5 | 0 |
| Advertisements ... ... ... ... | | | | 71 | 11 | 6 |
| Expenses of deputation to Cork, previous to Show ... ... ... ... ... | 10 | 17 | 9 | | | |
| Ditto of secretary and staff at Show ... | 24 | 18 | 10 | | | |
| Printing and selling 1000 catalogues ... | 18 | 5 | 0 | | | |
| Printing and stationery generally for Show | 15 | 11 | 6 | | | |
| | | | | 69 | 13 | 1 |
| | | | | £846 | 19 | 7 |

The time having come round, by rotation, for holding the next annual Cattle Show of the Society in the Province of Ulster, for the year 1851, steps were taken, by public advertisement and otherwise, for giving due publicity to such an arrangement; but the Council regret, that, up to the present time, no decisive move has been made to effect such a desirable object. The list of prizes for the ensuing year has, however, been agreed on, and are now submitted to the Society for approval, and the Council hope that nothing will intervene to prevent the Province of Ulster from aiding the efforts of the Society, to improve the breeds of stock, and encourage the introduction of new and improved agricultural implements into the north of Ireland.

*Local Farming Societies.*—In order to encourage the formation and revival of these useful bodies, the Council increased the amount of premiums to local farming societies considerably this year, and rescinded many conditions and restrictions which, it was conceived, interfered with their general working and utility. They regret, however, to state, that the numbers which have availed themselves of the Society's premiums, as yet, fall far short of their expectations, and prove the general decline that has taken place in these useful institutions, when compared with former years. Upwards of 27 claimed the Society's premiums last year, and it is expected that a similar number will qualify for 1850.

*Chemico-Agricultural Department.*—An offer having been made at the General Meeting in 1848, to render the Laboratory and Chemical Department of the Museum of Irish Industry, in Stephen's-green, available upon certain conditions, for promoting chemical analysis and inquiry on agricultural subjects, among the members of the Society, and the same having been accepted, Mr. William K. Sullivan, Chemical Assistant to that establishment, was appointed Chemist to this Society, and a set of rules and scales of prices published for the guidance and direction of the members. The Council regret, however, that little substantial benefit has hitherto been derived to the Society from the existing arrangement, and that they are obliged to recommend that it should terminate at the end of the present year; and that it should be referred to the Managing Committee to inquire and report on the best mode of procuring chemical advice and analyses on agricultural subjects in future, and of promoting the views of the members in this most important branch of agricultural knowledge.

*The Practical Instructors.*—The Council have reported to the Society, at the last General Meeting, that 33 instructors had been appointed to as many districts, including 12 from which the requisite contributions had been received, and 21 gratuitously, the Committee took the necessary steps for carrying out the views of his Excellency the Lord Lieutenant, and the Council, to secure the proper superintendence of the instructors in their respective districts, so as to render their services as practically useful as possible. The Local Committees previously formed were re-organised, and new bodies, where required, were established, to which the instructors were duly accredited, and a system of local superintendence and control was thereby formed, from which the best results have been experienced.

Summary of the Receipts and Expenses connected with the Practical Instructors for 1850:—

| RECEIPTS. | £ | s. | d. |
|---|---|---|---|
| To balance to credit of fund since 1849 ... ... | 301 | 18 | 10 |
| To third contribution from the Irish Reproductive Loan Fund, per the Earl of Clarendon ... ... | 1000 | 0 | 0 |
| Conditional Subscription from Local Societies towards procuring Practical Instructors for 1850 ... | 351 | 0 | 0 |
| Unconditional subscriptions ... ... ... | 674 | 0 | 0 |
| Amount refunded by the sale of green crop seeds at half-price, in 23 localities ... ... ... | 399 | 18 | 11 |
| | 2726 | 17 | 9 |
| DISBURSEMENTS. | | | |
| Paid salaries to 33 Practical Instructors ... ... | 1644 | 0 | 7 |
| For green-crop seeds to be sold at half price ... | 820 | 12 | 3 |
| Carriage, and other expenses connected therewith | 67 | 5 | 3 |
| Office expenses, printing, stationary, advertisements | 56 | 14 | 2 |
| Balance in bank to credit of fund ... ... ... | 138 | 6 | 1 |
| | £2726 | 17 | 9 |

The committee having closed the accounts and called in the instructors for the present year, were anxious to ascertain the wishes of his Excellency relative to the continuance of the system, during the approaching season. Accordingly, a letter was addressed to his Excellency, dated the 12th Sept. last, stating the results of the inquiries as to the general effects of the system, but that the Committee were of opinion, from the continued depression of the times, that it was vain to expect any timely or substantial contributions from those remote localities, where instruction and encouragement were most required, and, at the same time, it was most important that if assistance was given it should be available at as early a period as possible, and that a larger sum would be required than has been hitherto placed at the disposal of the Society for the purpose. To this communication a letter was received from Sir Thomas Redington in reply, dated the 11th October, stating that his Excellency was prepared to recommend to the Lords of the Treasury, the issue of another 1000*l.*, from the proceeds of the Irish Reproductive Loan Fund, upon the same terms and conditions as upon the three former occasions. Circulars were accordingly directed to be sent to the different districts mentioned in the counties specified in Sir Thomas Redington's letter of the 11th October, requesting to know what contributions might be expected from these localities in aid of the Instructor Fund for the ensuing year. To these circulars replies have been received, stating the total incompetency of the different localities to subscribe to the fund; and at a meeting of the Instructor Committee, held on the 21st November last, it was resolved to send instructors to 10 districts, gratuitously, leaving the balance of the fund to be applied to such applications as may be made from localities willing to contribute the necessary sum.

FLAX IMPROVEMENT SOCIETY OF IRELAND.—The tenth annual meeting of this Society was held on the 29th ult., in the Society's rooms, Commercial-buildings. The following extracts are from the report.

*The Flax Crops of* 1849 *and* 1850.—According to Captain Larcom's report, it appears that the Irish Flax crop of 1848 was 53,863 acres, and in 1849, 60,014, being an increase in the latter year of 6451 acres. The county of Donegal produced the largest quantity, 12,662 acres, being 1 to every 18 of arable land, while Kerry, with about the same superficial area, produced but 136 acres. The province of Ulster produced 57,651 acres of Flax, while Munster, with about the same superficial area, produced but 937. Monaghan gave 6775, while Limerick, with two and a half times its area, yielded only 94 acres. At the head of the southern and western counties appear those where the Society has already made some footing—Mayo giving 524 acres, which is more than all the rest of Connaught, and Cork 458, being about the half of what Munster produced. Sligo, again, with 218 acres, Clare 179, and Wexford 115, contrast favourably with such counties as Wicklow with 7, Waterford 11, and Kilkenny 16 acres; the three former having already made a commencement under this Society's superintendence, while the three last named have only now begun to bestir themselves. These details are all from the agricultural returns for 1849. Those for the present year not having been as yet compiled, it can be only stated, that there is reason to believe the breadth of land under Flax, in 1850, to have been greater than in 1849, more especially in the southern and western provinces, where many of the counties would make a more respectable figure than in the table just quoted. The sowing would have been still more extended, had it not been for the scarcity and

high prices of seed. The quality of Irish Flax, this year, is not so good as usual, the fibre being found to want mellowness, and being difficult to work. The yield has also not proved so large, in some localities, as was expected from the very luxuriant appearance of the growing crop. Notwithstanding this, however, the brisk demand and high prices for the fibre have so well remunerated the farmer, especially when contrasted with the low rates for other kinds of agricultural produce, as to insure a greatly increased breadth being sown next year; while, from the large supply of seed expected from abroad, and the quantity saved at home, farmers may be certain of obtaining what they require.

*The Patent Steeping System.*—The system of steeping Flax in hot water, brought under the notice of this Society by the late Mr. Schenck, in 1847, has, from the first, had the earnest attention of your committee. While approving the general principle, they have been cautious in pronouncing a decided opinion upon its details, in consequence of some objections having been made by parties in the north of Ireland. In order fully to investigate the grounds for these objections, they gave the matter in charge to a sub-committee, whose report, in which your committee very fully concur, will be laid before the Society at the present meeting; and they feel confident that it will sufficiently justify you in giving every encouragement, in all parts of Ireland, to the carrying out of the patent system. In the course of these investigations, your committee, being made acquainted from time to time with the results of the various experiments which had been conducted with a view to testing the merits of the plan, considered it advisable to give publicity to them; and, in consequence of their favourable nature, many parties have been induced to establish steeping concerns in different localities. The adoption of the system has been much facilitated by your committee having induced the late patentee to lower his terms for the right of working. Your committee have given their best attention to all new projects brought forward for preparing Flax fibre for sale, as the Society must be naturally solicitous to render every improvement auxiliary to the advantage of the grower, and to the perfecting of the products of his crop. They have, therefore, carefully investigated each new plan that has been submitted, and, for so far, they believe that nothing appears to combine so many advantages as Schenck's system. Within the last few months a plan of separating the Flax fibre without steeping has been brought forward in London, by Mr. Donlan, which has attracted great public attention. Your committee are of opinion, however, that the greatest caution should be exercised in the consideration of these statements, from the absence of data supported by the opinion of practical persons, competent to form a judgment on the merits of the proposed process, and from the fact that the dry preparation of Flax fibre has been frequently brought forward at former periods and in different countries, but has, in all cases, been given up, owing to its inutility. Although it would be unjust to the inventor for the Society to pronounce decidedly against his plan, without full information on all its details, yet your committee think, from the partial evidence which they have been able to collect, that there is no ground for supposing this process to be so advantageous, either to the producer or to the consumer, as Schenck's system; and they hope, therefore, that parties who have intended to adopt the latter may not be deterred by the plausible but unsubstantiated statements relative to the former which have appeared in the public journals.

*Division of Labour in Flax Management.*—It was early recognised by your committee that great advantage would be derived from the culture of the Flax plant, and the preparation of the fibre for sale, being separated into two distinct departments, requiring the farmer simply to prepare the soil, sow the seed, and pull and dry the mature Flax stems; and leaving to other parties the steeping, drying, and scutching operations. Being aware that in Belgium a large proportion of the Flax crop is purchased by factors from the growers, who steep it in the river Lys, and bring the fibre to market, your committee, in 1843, encouraged some enterprising and experienced individuals to undertake a similar system in Ireland, and the Society awarded them gold medals in testimony of its approval. But, although the advantage was apparent, of superior quality and handling in the Flax thus treated, from a variety of causes it was not found to be profitable to the undertakers; and there is reason to believe that the system cannot be made practically available in Ireland. Schenck's hot water method appears, however, to combine equal advantages in the quality of the product, with a fair profit to those who may embark in it as a business undertaking. While it is probable that those farmers who are particularly skilful in the management of their crop may produce as good an article by the ordinary mode, the proportion of such is so small to the great mass of Flax growers, that there can be no reasonable doubt the average quality of Flax brought to market from any district would be greatly improved by the adoption of the new system. In the value of the seed, which would be all saved by the new process, a yearly addition of fully a quarter of a million sterling would be made to the produce of the Irish Flax crop—a fact of itself sufficient to warrant its general adoption. But the most important advantage of this method, as relating to the general extension of Flax culture in Ireland, is the immediate market thus afforded to the grower, who is frequently deterred from an extension of his Flax crop by the risk and uncertainty attending the ordinary process of steeping in the open air, as well as by the difficulty of managing a large quantity, all of which has to be steeped at the same time; while, in many districts, the absence of facilities for watering precludes farmers from attempting its culture. In the introduction of the crop where it has not hitherto been grown, the establishment of a steeping concern and scutch-mill at once removes all the difficulties arising from the critical nature of the ordinary processes, and the want of a market on the spot for the fibre. With proper instructions in the choice of soils, their preparation, the selection of seed, and the sowing, pulling, and saving of the plant, the farmer will be enabled to produce a good article of Flax straw, while the capital, skill, and undivided attention of the steeper will insure that the fibre is produced in the market in a satisfactory state. Your committee therefore consider that a much more rapid development of Flax cultivation will take place all over the country, by the carrying out of Schenck's system, than if the growers were obliged to depend on the old method of manipulation.

*Saving of Flax-seed.*—The value of the seed of the Irish Flax crop, during the 10 years of the Society's labours, cannot be estimated at less than 2,000,000*l.* Of this large amount probably not more than one-tenth has been rendered available, the rest having all been steeped with the Flax, and thus utterly lost. Your committee have been untiring in their exertions to impress upon the farmers the lamentable waste arising from this practice; but even yet with only partial success. The reasons which have been instrumental in causing farmers to neglect this advice are various. Many could not be made to believe that the quality of the fibre is not injured by taking off the seed, and this opinion has been strengthened by the operation of rippling being often carelessly performed, with inefficient tools, so as to tear and break the ends of the Flax. It was also found difficult, in many cases, to carry on the rippling and steeping of a quantity at the same time. But the chief obstacle arose from the unfavourable weather, which frequentlly sets in in our climate at the pulling season, rendering it very difficult to dry the seed properly in the open air, and obliging the growers to kiln-dry it, which, when hurriedly done, causes the seed to shrivel, and leaves it of little comparative value. It has only, therefore, been in certain districts that the saving of Flax seed has become at all general, while in others it has not been practised at all. It is with no little satisfaction, therefore, that your committee have to call your attention to the fact that the drying of the Flax stems for Schenck's patent process necessitates the preserving of the seed, and insures its being saved of the best possible quality. Flax seed thus saved can be employed in two ways, either for sowing again or for cattle feeding. There is an annual import from foreign countries into the United Kingdom of about 650,000 quarters of seed, and 70,000 tons of oil-cake made from it—value together about 1,950,000*l.*, all of which could readily be supplanted by the home-grown article, while the valuable manure which it produces would return to the soil the greater part of the substances taken from it by the plant. To meet the annual demand for sowing, about 28,000 quarters of seed would be required, at an average value of 112,000*l.* Nor would the money value be the only advantage of producing this at home. It often happens, as in the case of the present year, that enough of foreign seed cannot be procured to meet the demand; and while its price is so much enhanced as to place its purchase beyond the means of the poorer class of farmers, much land that had been intended for Flax is put in other crops, after the import of seed has been exhausted. It is very gratifying to find that more than 6000 bushels of seed from the steeping concerns were sold last spring to farmers, and that the produce, as in all instances, where good home-saved seed is used, was abundant, and generally excelled the crops from foreign seed. Your committee calculate that nearly 40,000 bushels of Irish seed will be available for next sowing season, from this and other sources. They look confidently forward to a period not far distant, when the import of foreign seed will be restricted to the quantity necessary to maintain the vigour of the plant, as it has been found that if the same strain of seed be used for successive years, it degenerates in quality, but this might be obviated by changing the seed to different soils, as is done in the case of other plants.

## Farmers' Clubs.

SITTINGBOURNE.—*Guano.*—At a late meeting of this association, Sir J. M. Tylden gave the following results of experiments with guano. Last autumn, I set apart three pieces, of a quarter of an acre each, of Spalding Wheat. The previous crop was Cole after Rye, after Wheat, the Cole and Rye being fed off. On No. 1 I put no manure, on No. 2 guano at the rate of 4 cwt. per acre, and on No. 3 guano at the rate of 2 cwt. per acre; the cost of No. 2 being 2*l.*, and of No. 3 1*l.* per acre. The yield of No. 1 was 3 quarters 4 bushels, and the weight of straw and horse-meat was 1664 lbs. per acre; the weight of a bushel of this Wheat, 61½ lbs. the money value at 5*s.* per bushel for the corn, and 6*d.* for every 36 lbs. of straw and horse-meat, gives 8*l.* 16*s.* No. 2 had 4 cwt. of Peruvian guano harrowed in at sowing time. The yield per acre was 4 quarters 4 bushels and 6½ gallons, and the weight of straw, &c., 3936 lbs. The weight of a bushel was 61 lbs. Money value as before, 11*l.* 16*s.* 4*d.*, from which deduct 2*l.* for manure, there remains a clear gain over no manure of 1*l.* 0*s.* 4*d.*, or over 50 per cent. on the outlay. No. 3 had 2 cwt. of the same guano, sown at the same time as No. 2. The yield per acre was 4 quarters 1 bushel 6 gallons. Weight 61 lbs., and of straw, &c., 3312 lbs. Money value, deducting 1*l.* for the guano, 9*l.* 14*s.* 4*d.*, giving a clear gain over no manure of 13*s.* 4*d.*, or more than 35 per cent. In both these experiments the increase of corn has more than paid for the manure, for in No. 2 the increase was 8 bushels 6½ gallons, and in No. 3, 5 bushels 6 gallons. I also marked off 4 pieces of white Wheat, of a quarter of an acre each. Two after Clover, two after Tares, followed by Cole, both fed off after Wheat. One of each had no manure, and one of each at the rate of 2 cwt. of Peruvian guano, top dressed in February last. No. 1, Clover lea, no manure, yielded 4 quarters 1 bushel 5 gallons per acre. Weight per bushel, 60¾ lbs., with 3020 lbs. of straw, &c.; the money value per acre being 10*l.* 9*s.* 3*d.* No. 2, Clover lea, with guano at the rate of 2 cwt. per acre, yielded 4 quarters 4 bushels 5½ gallons per acre. Weight per bushel, 60¼ lbs. Weight of straw, 3768 lbs. The money value per acre, after deducting 1*l.* for manure, was 10*l.* 15*s.*, leaving only the small profit of 5*s.* 4*d.*, or rather more than 25 per cent. No. 3, Tares, and no manure, yielded 4 quarters 1 bushel, weighing 60 lbs., and straw, &c., 2708 lbs.; the money value of which was 10*l.* 3*s.* No. 4, Tares, &c., manured with guano at the rate of 2 cwt. per acre, yielded 4 quarters 7 bushels over half a gallon per acre, weighing 50½ lbs., weight of straw, &c., 3324 lbs.; the money value of which, deducting the price of manure 1*l.*, was 11*l.* 1*s.* 3*d.*, giving a profit over no manure of 18*s.* 3*d.*, or over 85 per cent., the corn more than paying for the guano; whilst on the Clover lea the corn alone did not pay for the guano, the difference between that and no manure being only 3 bushels and half a gallon. The inference I draw from this is, that it would be better to use the guano on the Clover, thereby ensuring a larger crop of Clover, and to a certainty as good a crop of Wheat.

## Reviews.

*The Breeding and Economy of Live Stock; being the results of Forty Years' Practical Experience in the Management and Disposal of Cattle, Horses, Sheep, and Pigs.* By James Dickson, Cattle Dealer. Adam and Charles Black, Edinburgh.

A SMALL octavo volume of 220 pages cannot be expected to enter into great detail upon so large a subject; and yet Mr. Dickson manages to describe within these limits the breeds of cattle, sheep, and horses in this country; to specify peculiarities of management, and to discuss modes of feeding and of breeding. The book is an easily written and agreeable lecture, by an intelligent practical man. The history of different breeds of sheep and cattle, illustrated by details of instances; the management of each, with numerous examples illustrative of outlay and returns, fill the book so nearly as to leave but little room for the description given of pigs and horses. It is with the former, apparently, that Mr. Dickson has been most familiar; and by confining his remarks to them, he has given us a good practical work, within the limits of a cheap size.

Among the most interesting parts of the book are his calculations of the cost and probable returns of farms, exclusively for breeding purposes—as for breeding short-horned bulls and Leicester sheep. These we shall hereafter transfer to our columns. Meanwhile we must be contented with a general recommendation of the work, which agricultural students will find useful, as one of the best, while it is the cheapest of the many existing works on its subject.

## Miscellaneous.

*Agricultural Carriages.*—On a farm of 1000 acres of good land, cultivated on the four-course, or Norfolk system of cropping, there will be probably 200 tons of hay made per annum, which, we may suppose, will be carried on an average, three-fourths of a mile to the rick: supposing one-half of the roots to be harvested and carried to the yards for consumption, there will probably be 2000 tons of roots carried three-fourths of a mile: there will be 1000 tons of grain in the straw carried three-fourths of a mile to the stack-yard: there will be probably nearly 400 tons of grain carried 10 miles to market: there will be some 40 or 50 tons of food or manure carried home that distance from market: and there will be nearly 4000 tons of manure every year carried three-fourths of a mile, from the yards to the fields. The subject of agricultural carriages may thus well be considered of considerable importance to the business of such a farm. Adding up the above items, we have a total equal to nearly 10,000 tons, carried a distance of one mile; and if to the weight of the load there be added, in each case, that of the vehicle as well, which in the case of a field carriage will be found equal to fully 60 per cent. on the load, we obtain the amount of 16,000 tons carried one mile, as the labour of this kind executed, per annum, on a farm of 1000 acres. But this amount must be still further increased, for an empty carriage* returns for every full one that goes; and supposing our estimate at 60 per cent. on the load fairly to represent the weight of the conveyance, we must add to our former amount 6000 tons carried one mile, on this account. Now the labour of carriage on fields and farm roads may be assumed equal to a lift of one-eighth of the load. To pull 22,000 tons one mile along the surface of the field or road, will be nearly the

* The forty or fifty tons of return carriage from market are not referred to here; but this small inaccuracy will not materially influence the result.

same as lifting 2750 tons one mile high. Now the working year may be supposed equal to 250 days, of 10 hours each; but a horse in a cart is not continually moving; it is at rest during the operation of filling and emptying, and therefore the time, per annum, in which it could be engaged in actually shifting the material it has to convey, cannot be put at more than three-fourths of the above, or 250 days of 7 hours and a half each; and a little calculation will show, that to lift 2750 tons one mile high, in 250 days of 7 hours and a half, requires a continual lifting of 290,000 lbs. per minute. This, according to Watt's estimate of a horse power, represents the constant labour of nearly 10 horses. And if we take the period during which there is most hauling, and ascertain the quantity of labour of this kind which must be done within a given time, in order that the ordinary routine processes of cultivation may be carried on, we shall find that the labour of carriage alone necessitates the employment of quite if not more than one-half of all the horse labour the farm employs. *J. C. M., in Morton's Cyclopedia of Agriculture.*

*Grease for Carts, &c.*—The following composition is recommended by a writer in the *Indépendance Belge* for greasing carts and other agricultural implements:—Take 4 lbs. of caoutchouc dissolved in a proper liquid, 1 lb. of gelatine, 10 lbs. of carbonate of soda, 45 quarts of animal or vegetable oil, and as much water; boil the water with the carbonate of soda and gelatine, then add the caoutchouc and the oil, stir the mixture well until it forms a homogeneous liquid. The above proportions may be varied, and if the caoutchouc and oil are previously purified, the carbonate of soda is unnecessary. The above mixture will be found very useful not only for greasing carts, &c., but also for keeping the farm harness in order. *Flore des Serres.*

*How to make Cows Calve in the Day-time.*—Every one has felt the inconvenience of having his cows calve during the night. In all seasons, but especially in winter, this is exceedingly annoying, and not only demands continual useless watching on the part of the cow-keeper, but also often, indirectly, causes the death of the calf and its mother. Now it has been ascertained by a person living in the neighbourhood of Utrecht, that a cow with calf milked for the last time at night instead of in the morning, calves in the day and not at night. Out of 30 cows on which the experiment was tried, only 3 or 4 are mentioned by M. Numon, professor of Agriculture at Utrecht, as being exceptions to the above rule. As confirming the above statement, we may mention the fact, that a large farmer in the Campine has also tried the same plan with success. *Flore des Serres.*

METEOROLOGICAL REPORT.—NOV.—DEC.

THE weather during the latter part of November was boisterous in the extreme, from a succession of storms passing from S.W. to N.E., causing rapid and excessive fluctuations of the barometer.

| Date. | Time. | Max. | Min. | REMARKS. |
|---|---|---|---|---|
| Sunday 17 | 8 a.m. | 29.95 | ... | |

* As the opposite side of this storm must have reached as far as to 76° of North latitude, the severe coldness which prevailed on the 26th and 28th is easily accounted for.

† This storm travelled from W. to E. over the north of Spain.

‡ I attribute these fogs to the storm having gone up the English Channel and the North Sea, which would send back the London smoke on the 8th, and the Dutch fogs on the 9th, on which day was the most cold raw fog we have had this season.

Dorchester, Dec. 17th. *F. P. B. M*

## Calendar of Operations.

DECEMBER.

ESSEX FARM, *Dec.* — Since my last we have been finishing Wheat sowing (now completed), and a better seed time I do not remember; the horses are now employed giving the last ploughing to the tilt land (not sit), which is summer fallowed, and intended for Barley; it is not often that this land can be ploughed so late in this part, as it is very heavy land, but at the same time it is considered as good as a quarter per acre more for it. The day-men are employed in scouring out the open ditches and trimming the hedges, covering the Mangold Wurzels and Swedes with about 6 inches of earth; they were only covered with straw at the time they were taken up. We lay them in ridges about 9 feet wide at the base, and finishing with as sharp an angle as possible. They keep well this way if not covered with earth till they have heated the first time, and a draining pipe is inserted here and there in the earth, sloping, so that the wet cannot enter. We had some Mangold Wurzel kept till August this year, and in most excellent condition. There seems to be some misunderstanding regarding the remarks in my last. I never intended to say that Swedes caused abortion; quite the reverse. I believe them to be a most valuable root at all times, but I believe that Mangold Wurzel does so, certainly, with sows, as I believe any one will find to their cost who may feed them exclusively on them, more particularly if fed out before April or May, when they become somewhat shrivelled and dry. They are a most excellent thing for ewes after they have dropped their lambs, and also for cows; but at the same time I must adhere to my former opinion, and I may add that it is not a small way in which Mangold Wurzel has been found to act injuriously. It has been the endeavour on this farm to raise pigs enough to pay the labour every week from harvest till the latter end of April, and this, on nearly 800 acres, requires no small number, particularly now, with pork at from 2*s.* 10*d.* to 3*s.* 2*d.* per stone; it, in fact, requires from 35 to 40 to bring home the money that 25 or 30 brought three or four years ago. The sows are got as forward in pigging in the spring as possible, and well fed with steamed roots mixed with Barley or Bean meal and milk. The young pigs soon begin to eat this mixture, and grow fast on it; as soon as they seem to feed well, they are removed from the mother and well kept till there is some Clover ready for them, when they are turned out and have their mixture morning and evening. The best are picked out about a fortnight or three weeks before it is intended to kill them; they then have more meal and less roots, and a few Beans and Peas once every day. They are shut in a shed, and as one lot is sent to Newgate Market, the next best takes their place. *E. X., near Braintree.*

## Notices to Correspondents.

ANBURY, OR FINGERS AND TOES: *Amateur.* We have had many complaints. Some have found lime, others bone-dust, others drainage, remove the scourge; and all have found that that in which they were deficient from the standard of good cultivation and fertile soil was the cause of the mischief.

FLAX: *Isle of Man.* The dry way of handling Flax has been often tried and always failed hitherto. And M'Clausson's mode is not likely to be more successful than its predecessors.

RAPE PLANTS: *W D E.* We hardly know how you are managing them. Do you steep them? If so, you cannot expect another crop of Beans till late in spring.

RYE-GRASS: *F B.* Sow early in April.

TURNIPS: *B.* Pile them between two rows of hurdles 6 or 8 feet apart; pile them up and thatch them over. Mind that there is straw enough at the sides too. That is the plan we have adopted, and they keep till May, if the cattle will let them.

"YOUATT ON THE HORSE:" *Yorkshire.* Inquiry has been made of the publishers.

# Markets.

COVENT GARDEN, JAN. 4.

Hothouse Grapes and Pine-apples remain nearly the same as quoted last week, and the same thing may be said of Apples and Pears. Oranges and Lemons are plentiful, an improving in quality. Nuts have not altered since our last account. Amongst Vegetables, there have been some excellent Seakale, Asparagus, and Rhubarb. French Beans, Carrots, and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle cheaper. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Gardenias, Bignonia venusta, Chrysanthemums, and Roses.

FRUITS.

Pine-apples, per lb., 4*s* to 6*s*
Grapes, hothouse, p. lb., 4*s* to 6*s*
— Portugal, p. lb., 8*d* to 1*s*
Pears, per doz., 1*s* to 3*s*
— per half sieve, 6*s* to 15*s*
Apples, dessert, p. bsh, 3*s* 6*d* to 8*s*
— kitchen, do., 3*s* 6*d* to 6*s*
Oranges, per doz., 9*d* to 2*s*
— per 100, 6*s* to 10*s*
Lemons, per doz., 1*s* to 2*s*
Pommegranates, each, 3*d* to 6*d*
Almonds, per peck, 6*s*
— sweet, per lb., 2*s* to 3*s*
Chestnuts, per peck, 2*s* to 5*s*
— per 100, 9*d* to 1*s* 6*d*
Nuts, Barcelona, p. bush., 20*s* to 22*s*
— Brazil, p. bsh., 12*s* to 14*s*
Filberts, per 100 lbs., 60*s* to 65*s*

VEGETABLES.

Brussels Sprouts, per hf. sieve, 1*s* 6*d* to 2*s*
Cabbages, per doz., 6*d* to 1*s*
Greens, p. doz. bun., 1*s* 6*d* to 2*s* 6*d*
Cauliflowers, p. doz., 4*s* to 6*s*
Broccoli, p. doz. bndl., 10*s* to 12*s*
French Beans, per 100, 2*s* to 3*s*
Seakale, per punnet, 2*s* 6*d* to 3*s*
Asparagus, per 100, 3*s* to 8*s*
Rhubarb, p. bundle, 1*s* 6*d* to 2*s*
Potatoes, per ton, 60*s* to 100*s*
— per cwt., 3*s* to 5*s*
— per bush., 1*s* 6*d* to 2*s* 6*d*
Turnips, p. 12 bundles, 1*s* to 2*s*
Cucumbers, each, 1*s* 6*d* to 4*s*
Radishes, per doz., 1*s* to 1*s* 6*d*
Celery, p. bundle, 9*d* to 1*s* 6*d*
Carrots, per doz., 2*s* to 5*s*
Spinach, p. half sieve, 6*d* to 1*s*
Onions, p. bunch, 4*d* to 6*d*
— Spanish, p. doz., 1*s* 6*d* to 4*s*
Leeks, per bunch, 1*d* to 2*d*
Shallots, per lb., 4*d* to 8*d*
Garlic, per lb., 4*d* to 8*d*
Artichokes, Jerusalem, p. half sieve, 1*s* 6*d* to 2*s*
Lettuce, Cabbage, p. score, 1*s*
— Cos, p. score, 1*s* to 1*s* 6*d*
Endive, per score, 1*s* to 1*s* 6*d*

POTATOES.—SOUTHWARK, Dec. 30.

The Committee report that the trade during the last week has been very heavy, and, though considerable reduction in price has been submitted to, there have not been so many Potatoes sold as we have had arrive since our last report, which have been very extensive, both by rail and coastwise. The following are this day's quotations:—York Regents, per ton, 90*s.* to 100*s.*; Scotch do., 55*s.* to 75*s.*; ditto Cups, 60*s.* to 65*s.*; Wisbeach Regents, 60*s.* to 80*s.*; French whites, 60*s.* to 70*s.*

COAL MARKET.—FRIDAY, Jan. 3.

Hollywell, 15*s.* 6*d.*; Carr's Hartley, 14*s.*; West Hartley, 14*s.*; Wallsend Haswell, 17*s.*; Wallsend Hetton, 17*s.*; Wallsend Lambton, 16*s.* 6*d.*; Wallsend Stewart's, 17*s.*; Wallsend Adelaide Tees, 16*s.*—Shipsat market, 320.

SMITHFIELD, MONDAY, Dec. 30.

We have a good supply of Beasts, considering it is so soon after Christmas. Trade is generally dull, but some of the choicest kinds still make 4*s.*; this must, however, be reckoned an extreme quotation. The number of Sheep is small, but the butchers not having cleared out well, they buy very sparingly. Only some of the small and good qualities are readily disposed of. Big Sheep are a heavy trade. Choice Calves are scarce and dearer. From Holland and Germany there are 43 Beasts, 150 Sheep, and 76 Calves; from Norfolk and Suffolk, 700 Beasts; from Scotland, 250; and 1800 from the northern and midland counties.

| Per st. of 8 lbs. | s d | s d | Per st. of 8 lbs. | s d | s d |
|---|---|---|---|---|---|
| Best Scots, Here- | | | Best Long-wools | 3 6 | to 3 10 |

| Half-breds ... | 3 10 | — 4 2 | Calves ... ... ... | 3 0 | — 4 6 |
| Ditto Shorn ... ... | — | ... | Pigs ... ... ... | 3 0 | — 4 0 |

Beasts, 3169; Sheep and Lambs, 1550; Calves, 127; Pigs, 360.

FRIDAY, Jan. 3.

Although the number of Beasts is small, it considerably exceeds the demand. Notwithstanding, there is a reduction in prices of fully 2d. per 8 lbs. Several remain unsold. There are purchasers for the few Sheep we have on offer, at about last Monday's quotations. Calves are about 4d. per 8 lbs. lower than on Monday last, the demand being exceedingly limited. Our foreign supply consists of 73 Beasts, 400 Sheep, and 48 Calves; there are 80 milch cows from the home counties.

MARK LANE.

MONDAY, Dec. 30.—The supply of Wheat by land carriage samples this morning from Essex and Kent was very small, and the condition generally damp; fine dry parcels command our quotations, but all others must be written 1*s.* per qr. lower; in foreign, business was exceedingly limited at late rates.—Barley, Beans, and Peas of all descriptions are 1*s.* per qr. cheaper.—The Oat trade is heavy, and sales are difficult at a decline of 6*d.* to 1*s.* per qr.

FRIDAY, Jan. 3.—The arrivals of grain since Monday have been moderate, with the exception of 19,850 qrs. of Wheat from abroad; this morning there appeared to be a general disinclination to purchase any description of corn and Flour, and the quotations of Monday must be considered nominal for all sorts. Transactions in floating cargoes are rare; good Polish Odessa must be quoted 34*s.* to 35*s.*, cost, freight, and insurance. Galatz Maize 30*s.*, with a downward tendency.

LIVERPOOL, FRIDAY, Dec. 27.—In consequence of the observance of holidays this week, the trade here since our last report has been completely at a stand. The trade at our market this morning varied little from its previous character. The sales of Wheat were limited to a few remnants, forced off in order to clear up accounts; importers, however, were generally firm. Prime Malting Barley was saleable at former prices, whilst in grinding samples little or no business was apparent. Malt, Beans, and Peas, being scarcely noticed, were the turn cheaper. Oats and Oatmeal were also much neglected, each barely sustaining recent values. Indian Corn was in slow request, losing the small advance of Tuesday.—TUESDAY, Dec. 31.—This morning being the last market for the year, trade was inanimate, and of Wheat very few sales were effected; holders, nevertheless, remained firm, and late quotations continue unaltered. Of Flour, also, few sales were effected, secondary qualities receding 1*s.* per sack. Barley, Beans, and Peas appeared to meet little notice, the value of each remaining nominally unaltered. Oats, being extremely difficult of sale, declined 1*d.* per 45 lbs.; and Oatmeal was partially depressed in value. Irish buyers, being rather forbearing to-day, Indian Corn was in less active request, and although 6*d.* per qr. cheaper, good yellow could not be purchased under 31*s.* per qr. The following are the prices: Wheat, English red, per 70 lbs., 5*s.* 6*d.* to 6*s.* 1*d.*; white, 5*s.* 6*d.* to 6*s.* 3*d.* Barley, Scotch and Irish, per 60 lbs., 3*s.* 2*d.* to 3*s.* 5*d.* Malt, English, per qr. pale, 50*s.* to 55*s.* Oats, English and Scotch, per 45 lbs., 2*s.* 8*d.* to 2*s.* 11*d.* Beans, English, per qr., 27*s.* to 31*s.* Peas, do. do., 29*s.* to 31*s.*

# RURAL CHEMISTRY:

## AN ELEMENTARY INTRODUCTION TO THE STUDY OF THE SCIENCE IN ITS RELATION TO AGRICULTURE.

BY EDWARD SOLLY, F.R.S, F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Honourable East India Company's Military Seminary at Addiscombe, &c., &c.

### PREFACE TO THE THIRD EDITION.

"In accordance with numerous suggestions, very considerable additions have been made to this little book, in preparing it for a new edition; several important practical matters, not treated of in any former editions, having been introduced. Brief descriptions of the more important of the domestic arts, such as Wine and Vinegar Making, Brewing, the Manufacture of Spirits Baking, Cheese-making, Cookery, &c., have been added, together with some account of the Scientific Principles involved in those arts. Numerous recent analyses of agricultural crops have likewise been given, and the whole has been carefully revised and corrected."

### CONTENTS OF THE VOLUME.

Absorption of manure
Acetates
Acetic acid
Acetic fermentation
Acids

Price *Fivepence*, of all Booksellers, or
*Sixpence, Stamped*, free by post, of all News Agents.

*It contains a Descriptive Catalogue of the best* CULINARY VEGETABLES *in cultivation, with the time of sowing, height, and other useful particulars; also a Description of all the best sorts of* AGRICULTURAL SEEDS, *as well as a most comprehensive list of the choicest and best* FLOWER SEEDS, *giving the height, colour, hardiness, and duration of each kind.*

*It contains also a* COMPLETE CALENDAR OF OPERATIONS *in the Kitchen Garden for every month throughout the year, as well as a* GARDEN ALMANAC, *with a short description of Mr. Paxton's "*CRYSTAL PALACE," *the Victoria Regia or Gigantic Water Lily, the Botanic Gardens, Plymouth, with other information relating to Gardens and Gardening Operations*

COPIES CAN ALSO BE OBTAINED FROM
WILLIAM E. RENDLE AND CO.,
Seed Merchants, Plymouth,
exchange for Six Postage Stamps.

A *Copy of our* PRICE CURRENT AND GARDEN DIRECTORY *was forwarded to* HIS ROYAL HIGHNESS PRINCE ALBERT, *and by return of post we received a complimentary letter, conveying His Royal Highness's "best thanks." Dated Windsor Castle, November* 20, 1850.

The following letter has just been received from Mr. James Barnes, the celebrated and well-known Gardener at Lady Rolle's, Bicton Gardens, Sidmouth, Devon :—

"Bicton Gardens, Sidmouth, Nov. 30, 1850.

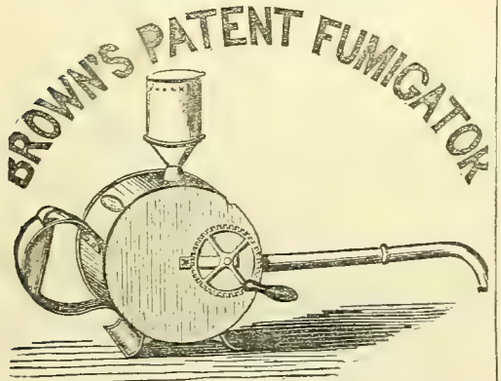
"Gentlemen,—I beg to acknowledge the receipt of your PRICE CURRENT AND GARDEN DIRECTORY,' for which I beg to return you my best thanks. I have read it with much interest, and am of opinion that it will be found not only interesting, but very useful to a large majority of the gardening world.—I am, Gentlemen, respectfully, your obedient servant,

"To Messrs. W. E. Rendle & Co. "JAMES BARNES."

The following letter has also been received from Mr. Robert Errington, Gardener to Sir P. Egerton, Bart., Oulton Park :—

"Oulton Park, Tarporley, Nov. 21, 1850.

"Gentlemen,—I am much obliged by the receipt of your very interesting and useful annual—'PRICE CURRENT AND GARDEN DIRECTORY.' This is just how things should be. I have long anticipated the period when such things must take place, for we may rest assured that it is at once the duty and interest of the tradesmen to do all in his power to please his customer, and in no profession is this more requisite than in that of the Nursery and Seedsman. I have looked carefully over it, and think it does you great credit, both in the general arrangements and the very creditable degree of accuracy to be found in the details.



"I remain, Gentlemen, your most obedient servant,
"ROBERT ERRINGTON."

The PRICE CURRENT has also been reviewed in the following newspapers and magazines, in the whole of which it has been spoken very favourably of :—

TO LET, A RESIDENCE AND FARM, suited to the occupation of a Gentleman. The house is pleasantly situated, and with the buildings (which are calculated for the system of box-feeding), has been recently erected. The farm contains about 190 acres (half arable) of superior land.—For particulars apply to Mr. FITZHERBERT, Monk's Kirby, Rugby.

AGRICULTURAL EDUCATION.

TO TENANT-FARMERS, &c.—Arrangements are made and Funds provided by several Noblemen and Gentlemen, advocates of combining "Science with Practice," to disseminate those principles through every county of England, by educating one or two youths from each county, whose age must not be less than 14; and they will be expected to know the fundamental rules of Arithmetic, and write a good plain hand on nomination, and to remain in the establishment two years at least. They will be taught Surveying, Draining, Irrigating, Measuring and Valuing Timber, Buildings, and Farm Stock; analysing Soils and Manures; the Breeds, Management, and Diseases of Cattle; Veterinary practice; practical Mechanics, management of Steam power; Botany, Mineralogy, and systems of keeping Farm Accounts, free of every cost, the parents paying only a small sum for their Board, Lodging, and Laundry. Applications must be made, in the first instance, by Letter, to the Secretary for Agricultural Education, care of Messrs. DAWSON and SONS, Advertising Offices, 39, Cannon-street, City.

DO YOU BRUISE YOUR OATS?
No; then you lose 50 per cent.

A NICE STABLE MESS, effecting immense saving, and vastly improving the condition of the animal—bruised Oats, straw cut into chaff of a certain length, and a little hay; the whole steamed, and served up at discretion. No rack—down with the racks;—MARY WEDLAKE'S MACHINES, 118, Fenchurch-street, and 11, Tavistock-street, Covent-garden, where a machine may be seen at work. A pamphlet on the above, by sending 12 postage stamps.

Just published, in One small Volume, price Half-a-Crown,
WHAT WAS SAID IN THE WOODS.
Translated from the German.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

By THOMAS TATE, of Kneller Training College, Twickenham, late Mathematical Professor and Lecturer on Chemistry; the National Society's Training College, Battersea; Author of "Exercises on Mechanics and Natural Philosophy," &c.

By the same author, in the press,
The PRINCIPLES of MECHANICAL PHILOSOPHY applied to INDUSTRIAL MECHANICS. 12mo. Woodcuts.

On the STRENGTH of MATERIALS. Just published. In 8vo, price 5*s.* 6*d.* cloth.

"This may be briefly regarded as the best and most scientific treatise on a subject of great practical importance."
*Lady's and Gentleman's Diary.*
London: LONGMAN, BROWN, GREEN, and LONGMANS.

BEAUTIFYING AND PRESERVING THE HAIR.—To preserve the human hair has been for a long time the unsuccessful pursuit of innumerable chemists and naturalists, and although there have been various compounds professing to accomplish this desirable end, still nothing really capable of restoring and preserving one of the most beautiful of Nature's gifts was discovered until 1821, when the result of a series of experiments, tried for a long previous period upon persons of all constitutions, fully established the infallible virtues of
C. AND A. OLDRIDGE'S BALM OF COLUMBIA.

The wonderful efficacy of this inestimable compound in restoring the hair to its pristine beauty, and the certainty with which its conservative agency operates in preserving it, has received, as might be expected, the most flattering testimonials from the grateful thousands who have experienced its effects.—3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle; no other prices.—When you ask for OLDRIDGE'S BALM, never let the shopkeepers persuade you to use any other article as a substitute.—13, Wellington-street North, Strand, a few doors above the Lyceum Theatre, on the opposite side.

CAUTION.

NIGHT LIGHTS.—PATENT ALBERT NIGHT LIGHTS (Patented 30th January, 1844), CHILDS' NIGHT LIGHTS (Registered 20th September, 1843) are sold by all Grocers and Wax Chandlers throughout the country, at 6*d.* per box. The sale of the above, amounting at the present time to many tons weekly, shows that they meet with the approbation of the public; any description of them is therefore unnecessary. The object of this advertisement is, to request purchasers to *examine the name on the boxes*, so as to insure their getting what they intend.

Night Lights are liable not to last the time that they profess (frequently going out an hour or two after lighting); to be affected by the temperature of the room they are burnt in; to be injured by keeping any length of time, and to have an unpleasant smell. The manufacturers consider that, by use of materials secured to them by several patents, and by long experience in the manufacture, that they have overcome these difficulties; and they therefore beg, that should any attempted substitutes be recommended, they may be carefully compared as to all the above particulars.

N.B.—The wine-glass-shaped Lamp, on which is stamped "Clarke's Patent," is that recommended for the Albert Lights.
PRICE'S PATENT CANDLE COMPANY, Belmont, Vauxhall.

SEASONABLE PRESENTS.—At this festive period of the year, friends and lovers are more than usually desirous of shining in PERSONAL ATTRACTION, and the following unrivalled discoveries for the TOILET are called into increased requisition, namely—
ROWLANDS' MACASSAR OIL,
for creating and sustaining a luxuriant head of hair;
ROWLANDS' KALYDOR,
for rendering the Skin soft, fair, and blooming; and
ROWLAND'S ODONTO,
OR PEARL DENTIFRICE,
for imparting a pearl-like whiteness to the Teeth.

The patronage of Royalty throughout Europe, and the high appreciation by Rank and Fashion, with the well-known infallible efficacy of these articles, give them a celebrity unparalleled, and render them a peculiarly
ELEGANT AND SEASONABLE PRESENT.

BEWARE OF SPURIOUS IMITATIONS.—The only Genuine of each bears the name of "ROWLANDS'" preceding that of the article on the wrapper or label, with their signature at the foot, in *red ink*, thus—
A. ROWLAND AND SONS.
Sold by them at 20, Hatton-garden, London; and by respectable Chemists and Perfumers.

Printed by WILLIAM BRADBURY, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JANUARY 4, 1851.

FIR CONES.—A Gentleman desirous of completing a collection of rare Cones, such as Araucaria, Cryptomeria; Mexican, Californian, and Himalayan Pinus; Picea, Cedar, &c., would be glad to hear of any one willing to part with them. No objections to the seeds being out if the Cones are in a good state.—Direct to T. G. P., care of Mr. WELLS, Highnam-court, Gloucester.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Jan. 11.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

PEARS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, Clarendon Nursery, St. Helier, Jersey, Channel Islands, begs to offer the following new PEARS, of the first merit:

BEURRE CLAIREGEAU, bearing the name of the raiser of this valuable Pear.—A very large fruit, perfectly melting, and a late fruit of first merit. Price 5*s.*

BEURRE D'HIVER.—Also large, and keeps till April, perfectly melting, hardy, and great bearer. Price 5*s.*

BEURRE NANTAIS.—The earliest Pear known, excellent, and great bearer. Price 2*s.* 6*d.*

The above R. L. can strongly recommend. None will be forwarded to unknown correspondents except on the receipt of cash or reference.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

J. G. WAITE'S CATALOGUE OF VEGETABLE SEEDS is now Ready, with Prices to suit the times, and can be had on application.
181, High Holborn, London.

J. G. WAITE'S CATALOGUE OF FLOWER SEEDS is also Ready, and can be had on application.
181, High Holborn, London.

SION-HOUSE DWARF FRENCH BEAN, new, early, buff speckled. This is the earliest Bean known, and can be had in any quantity, price 21*s.* per bushel.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London, where every other kind of Seed in cultivation can be had, on better terms than at any other House in the Trade.

RHUBARB ROOTS TRUE TO NAME.—Myatt's Victoria, 6*s.* per doz.; Myatt's Linnæus, 9*s.* per doz.; Mitchell's Albert, 9*s.* per doz.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

STRAWBERRY PLANTS.—Kitley's Goliah, 10*s.* per 100; Myatt's Eleanor, 4*s.* per 100.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

NEW GIANT ASPARAGUS PLANTS, 5*s.* per 100. LARGE GIANT SEAKALE PLANTS, 8*s.* per 100.
At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

VICTORIA REGIA SEED.—Each seed, 5*s.* The usual discount.
At LOUIS VAN HOUTTE'S Nursery, Ghent. (Free to London.)

FOR CHEAPNESS, QUALITY, DISPLAY, and UTILITY, *the following are strongly recommended.*

HOLLYHOCKS, No. 1, fine double named kinds, all shades of colour, per doz., 9*s.*, or per 100, 2*l.* 10*s.* HOLLYHOCKS, No. 2, for border display, very good, per doz., 6*s.*, or per 100, 1*l.* 10*s.* These are selected from some hundreds of seedlings, and may be confidently relied on.

HERBACEOUS PLANTS.—Purchaser's Selection, from List, per 100, 3*l.* 3*s.*

W. MAY'S selection, extra fine, No. 1, 2*l.* 2*s.* per 100;
,, ,, really good, No. 2, 1*l.* 10*s.* ,,

Having an immense stock they can be furnished at these low prices. The collection extends over 700 species and varieties selected from the choicest stocks in the country (regardless of expense) for display, and warranted second to none. To meet our customers in every way, we hope to be favoured with lists of such plants as are already in their collections, that duplicates of any article may not be sent where the selections are left to ourselves.

FLOWERING SHRUBS AND ORNAMENTAL TREES.—The finest vars., purchaser's selection, from the list, per 100, 3*l.* 3*s.*

W. MAY'S selection, No. 1, extra fine, per 100, 2*l.* 2*s.*
,, ,, No. 2, good kinds, ,, 1*l.* 5*s.*

This Nursery has long held high celebrity for possessing a most splendid stock of flowering shrubs, extending over upwards of 600 species and varieties of the choicest kinds. Some hundreds were selected by Mr. E. KEMP for the Park at Birkenhead; and for correctness of naming, quality, and health, not excelled by any.

To gentlemen forming Arboretums, or making extensive Ornamental Shrubberies, this is an opportunity seldom offered.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4*l.*; or per 100, 10*s.*, fine healthy stuff; 2 to 3 feet, bushy, extra fine, per 1000, 5*l.*—per 100, 15*s.*

GOOSEBERRIES, all the finest Lancashire show sorts, per 1000, 4*l.*, in 100 varieties, or per 100, 10*s.*, in 50 varieties; the stock extends over 30,000, and is very fine and healthy.

CURRANTS—White, Red, and Black, including Black Naples, per 100, 10*s.*, fine.

Fruit and Forest Trees, fine, and equally low, and of the most approved kinds, warranted true.

Kitchen and Flower-garden Seeds, of the best quality, very cheap.

Greenhouse and Stove Plants, a splendid stock, at low prices. Catalogues on application gratis.

Orders (except for Forest Trees), above 5*l.*, will be delivered carriage free, or allowed to London or within 150 miles of the Nurseries.—Address, WILLIAM MAY, Hope Nurseries, Leeming-lane, Bedale, Yorkshire. Post-office orders should be made payable on Bedale, to JOHN MAY.

NEW FANCY DAHLIA—"MRS. WILLES."

EDWARD LIDDIARD, Hungerford, Berks (the raiser of "Miss Compton," which gave such universal satisfaction last season) is sending out roots of the above fine Fancy Dahlia to the trade, at 3*l.* 3*s.* each. Colour, blush, shaded off to the margin with maroon, full and constant in its marking. Height, 3 feet 6 inches. Plants in May, 7*s.* 6*d.*—Address as above, or to Mr. E. SPARY, Florist, Brighton.

NEW RANUNCULUS ROOTS, a choice selection, containing edged, spotted, striped, and superb self colours, which have gained upwards of 40 first prizes, are offered in one mixture at 21*s.* per 100; the best old named varieties, at 6*s.* per 100. May be had at 6, Leadenhall-street, London; or of SAMUEL WALTERS, Nurseryman, &c., Hilperton, Trowbridge, Wilts.

ROSES.

ADAM PAUL AND SON beg to inform their friends and the public in general that they have still a good stock of most of the leading kinds of ROSES, which, when the selection is left to them, they offer on the following advantageous terms:

| | | |
|---|---|---|
| Standard Roses, in 12 superior vars., | 18*s.* to 24*s.* | per doz. |
| Dwarf Standard do. do. | 12*s.* to 18*s.* | ,, |
| Climbing Roses do. | 9*s.* to 12*s.* | ,, |

A priced descriptive Catalogue forwarded on receipt of one postage stamp.
All packages delivered free of carriage to London.
Nurseries, Cheshunt, Herts, Jan. 11.

NURSERY CATALOGUES.—The following priced Catalogues may be obtained from the Cheshunt Nurseries, free by post, on receipt of one postage stamp.

A. Descriptive Catalogue of Roses.
B. Catalogue of Hardy Ornamental Trees and Shrubs.
C. ,, Fruit Trees.
D. ,, Hardy Herbaceous Plants.
E. ,, Forest Trees.

ADAM PAUL and SON, Nurseries, Cheshunt, Herts.

TO SEEDSMEN AND MARKET GARDENERS.
GENUINE NEW SEEDS.

| | |
|---|---|
| Early Horn Carrot, selected | Ringwood Marrow Peas [fine |
| Long Surrey Carrot | Queen of England Peas, very |
| White Belgian Carrot | Brussels Sprouts, grown from fresh imported seed |
| Selected Altringham do. | Fine stock green curled Savoy |
| Improved Jersey Marrow Parsnip | Cole's superb dwarf red Celery |
| Drumhead Cabbage | Mignonette |
| Yellow Globe Mangold Wurzel | Mixed Sweet Peas |
| Lucerne (imported) | True Italian Rye-grass. |
| Skirving's Swede | True Ash-leaf Kidney Potatoes |

JOHN SUTTON AND SONS, Reading, having grown rather more than they will require of the above-named articles, beg to offer them to the trade, as being fine stocks, which they can confidently recommend. *Low Prices will be given in reply to applications stating quantities required.*

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. WILLIAM BRAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. WILLIAM BRAILSFORD, who, upon their receipt, will return an order upon Mr. RIVERS for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

THE NEW EARLY SWEET-KERNELLED KAISHA APRICOT.

MESSRS. VEITCH AND SON feel much confidence in bringing into public notice the above valuable new Syrian Apricot, sent to this country by the late JOHN BARKER, Esq., of Suedia, the gentleman by whom the valuable Stanwick Nectarine was introduced. Having obtained the entire Stock, they are now prepared to send out a limited number of healthy Young Trees at the following prices, and solicit the favour of early orders, which will ensure good trees and meet with immediate attention:

| | | |
|---|---|---|
| Healthy one year old Trees | ... 21*s.* 0*d.* | |
| ,, one year trained | ... 31 6 | } package included. |
| ,, two year trained | ... 42 0 | |

A few, chiefly half standards and standards.

In offering the above valuable new early Apricot for sale, Messrs. VEITCH and SON beg to refer to the description given by Dr. LINDLEY, in the "Journal of the London Horticultural Society" for July, 1849, from which the following extract is given:

"The fruit semi-transparent, roundish 5½ inches, in circumference, skin slightly downy, pale citron-coloured where shaded, tinged and marked with red next the sun. Flesh tender, juicy, of a clear citron colour, parting freely from the stone, *sugary and delicious*, like well refined lump sugar combined with Apricot flavour; stone *small*, roundish; kernel sweet like a nut. A valuable early variety for the dessert, and probably excellent for preserving; if it be employed for this purpose, the transparency of its flesh will exhibit a new feature amongst Apricot preserves. Some of the fruits have ripened as early as the 12th of July, and on the *same wall* at the time were Moorpark and Turkey Apricots perfectly green and hard."

Exeter, Jan. 1851.

NEW EARLY PEAS, &c.

BASS AND BROWN have a very fine Stock of the undermentioned early Seeds, which they are enabled to offer at the following low prices:—

| | Per quart.—*s.* | *d.* |
|---|---|---|
| PEAS, Taylor's new Prolific, very early, hardy, and productive, sent out by Barnes ... ... ... | ... 1 | 6 |
| Essex Champion, hardy and very productive ... | ... 0 | 8 |

| Wood's new early Scarlet ... ... ... ... | ... 2 | 0 |

Their Wholesale List of Prices of the above and all other description of Seeds will be forwarded on application.
Seed and Horticultural Establishment, Sudbury, Suffolk.

RENÉ LANGELIER, of the Clarendon Nursery, St. Helier, Jersey, begs to draw the attention of the Public to his still unrivalled collection of PEAR TREES, not yet surpassed in Europe, in which will be found all the very best varieties, insured for the season required. Trees may be had already formed, either pyramidal or for espalier, in unusually fine and healthy condition, such as will give the most ample satisfaction to both purchaser and R. L. The price has been much reduced, and the quantity of trees R. L. possesses enables him to supply the trade with guaranteed sorts equal to any house on the Continent, having given the greatest satisfaction for several years. Foreign correspondents will find a very great advantage if the selection is left to R. L., as they will be cheaper, and none but the best sorts will be supplied.

R. L.'s Descriptive Catalogue, which has been found the best and most correct yet published, is only to be had at his Nursery, Jersey, price 1*s.* 6*d.*, and 6*d.* extra for postage.

A very great reduction has been made in the transit by steamers to all parts of England, so that R. L. can supply trees cheaper than any other grower.

A fine collection of Roses, Camellias, and yellow Picotees.

WE beg respectfully to acquaint our numerous PATRONS that we have now a good and healthy stock, our own growth, of most of the new and rare TREES AND SHRUBS, especially the former, which we have, by diligent research, collected from the Continent, and other parts. To give an idea of their price, we may observe that they average about 30*s.* per dozen.

CHOICE SELECTIONS OF THESE NEW TREES AND SHRUBS WILL BE FURNISHED IN 5*l.* OR 10*l.* ASSORTMENTS.

KNIGHT and PERRY.

EXOTIC NURSERY, KING'S-ROAD, CHELSEA.

---

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem ... ... ... ... ... | 42*s.* to 60*s.* |
| Extra superior selected Standards ... ... ... | 18*s.* to 24*s.* |
| Fine Dwarfs and Dwarf Standards ... ... ... | 10*s.* to 16*s.* |
| Superb do. do. (for exhibition) ... | 18*s.* |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 ... | 50*s.* |
| Good do. do. without names, per 100 | 30*s.* |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

---

AN UNLIMITED STOCK OF REMARKABLY FINE SEEDLING AND TRANSPLANTED LARCHES AT REDUCED PRICES.

WM. WOOD AND SON, being very extensive holders of the above, and all other kinds of seedling and transplanted Forest trees, will be happy to furnish prices on application.

N.B. Catalogues of Vegetable, Flower, and Agricultural Seeds, also of Nursery Stock, will be forwarded free.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

---

SEEDS OF THE BEST QUALITY, CARRIAGE FREE.

J. C. WHEELER AND SON have had the honour of being appointed Seedsmen to the Gloucestershire Agricultural Association. Their Priced List of Seeds for this season is just ready, and will be forwarded free by post to any address on receipt of two postage stamps. This Catalogue is not a long list of useless names; it is really what it professes to be, a List of the best Seeds in cultivation, and will be found a safe guide to all purchasers.

Dr. LINDLEY, in the *Gardeners' Chronicle*, of the 2d March last, strongly recommends it in the following terms:

"THE CATALOGUE OF SEEDS SOLD BY J. C. WHEELER AND CO., GLOUCESTER, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless, incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."

J. C. WHEELER and SON, deliver their Seeds CARRIAGE FREE.

Kingsholm Nursery; and 99, Northgate-street, Gloucester.

---

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENÉ LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The stock is such as has never before been offered to the public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents.

---

SAMUEL FINNEY AND CO.'S CATALOGUE OF SEEDS, for 1851, is now ready, and may be had postage free, on application. It contains a Select List of all the most approved sorts of Culinary Vegetables in cultivation. Also an extensive collection of Flower Seeds, including the imported German kinds, with descriptions, stating the proper time for sowing, hardiness, duration, height, time of flowering, and the colour of each, with much other useful information. The collections of Seeds sent out last year by S. F. and Co. having given general satisfaction, they again offer them as under.

VEGETABLE SEEDS.—CARRIAGE FREE.

We prove the growth of each kind before we send them out.

---

SEEDS, FLOWER-ROOTS, PLANTS.

THEODORE LOCKHART, SEEDSMAN AND FLORIST, 84, Fleet-street (next door to the *Punch* Office), London, has just received his annual supply of German Seeds. The following he warrants of first-rate quality:

| | | | | |
|---|---|---|---|---|
| 12 distinct vars. German Stocks ... ... | 3*s.* and | 6*s.* | 0*d.* |
| 12 ditto. ditto. Asters ... ... | 3 and | 6 | 0 |
| Lockhart's rosette Collard or Colewort, per oz. ... | | 4 | 0 |
| Imported Brussels Sprouts, per oz. ... ... ... | | 1 | 0 |
| Fulham early scarlet frame Radish, per quart. ... | | 2 | 0 |
| Glenny's 6 vars. Camellia Balsam ... ... ... | | 2 | 6 |
| 14 vars. prize Cucumbers, each per packet ... ... | | 1 | 0 |
| Beechwood, Trotter's scarlet flesh and green Persian Melons, each, per packet ... ... ... ... | | 1 | 0 |

All the above sealed in packets and signed by T. L.

| | |
|---|---|
| Ranunculus, in 50 sorts, named ... ... | 25*s.* |
| Lawn Grass Seed, per lb. ... ... ... | 1*s.* |

All kinds of Peas, early Potatoes, and Fruit Trees. Lists gratis on application.

---

THE TRUE OLD ASH-LEAF KIDNEY, the NEW RED ASH-LEAF KIDNEY, and JACKSON'S NEW EARLY KIDNEY POTATOES.—Market Gardeners and others growing Early Potatoes, are recommended to plant the above-named excellent sorts, which can be warranted true and sound. Prices low, according to quantities required. Several other choice sorts may also be had, at moderate prices.

Address, JOHN SUTTON and Sons, Seed Growers, Reading, Berks.

---

DOUBLE LILY OF THE VALLEY.—In answer to numerous inquiries for the above, and the great satisfaction given by the plants sent out by J. REID last season, he begs to state he has this year a few strong Flowering Roots to dispose of. The graceful habit, delicate appearance, and delicious perfume which the flower possesses, render it equally suitable for the Lady's Posey or the Drawing-room Bouquet. By enclosing 24 penny postage stamps, 12 strong Roots will be sent free to any part of the United Kingdom.—J. REID, Nurseryman and Seedsman, Richmond-street, Weston-Super-Mare, Somerset.

---

CUCUMBER—"PHENOMENA."

EDWARD TILEY begs to offer to Cucumber-growers generally the above superb CUCUMBER, which he feels confident will give the greatest satisfaction to them, as did the former kinds sent out by him during the last seven years, being Victory of Bath, Gordon's White Spine, and Lord Keynon's Favourite.

The above splendid Cucumber, "Phenomena," was a hybrid between Hamilton's Black Spine and Mills's Jewess, which it surpasses, both for its prolific qualities and length of fruit, generally growing from 22 to 28 inches. It is a beautiful black spine, of a dark green colour, and free from ribs or shrivels; it also grows quickly, carries its bloom well, and will be found first-rate for exhibition. As a proof of its prolific qualities and length, the following may be vouched for, viz.:—There were cut from two plants, grown in a one-light box, the size of which was 4 feet by 6, 24 brace of Cucumbers, each fruit averaging 22 inches long—total length of the whole amounting to 29 yards 1 foot. It is solid, and eats very crisp. Sold in packets containing seven seeds, 5*s.*; or three seeds, 2*s.* 6*d.*

E. T. has also seed of his three other superb Cucumbers at the following prices:

| | | | |
|---|---|---|---|
| Victory of Bath, per packet ... ... ... | 2*s.* | 0*d.* |
| Gordon's White Spine, ditto ... ... ... | 1 | 6 |
| Lord Keynon's Favourite, ditto ... ... | 2 | 6 |

This last is the best for winter cultivation.

MELONS.

BROMHAM HALL GREEN-FLESH MELON.—This has again this season surpassed all others for its superior flavour; it was placed first and second for flavour at the Chiswick Exhibition last season, and obtained a great number of first prizes throughout the country where exhibited. Sold in packets at 1*s.* 6*d.* each.

E. T. has also seeds of the following superb Melons, which he can with confidence recommend:

| | | | |
|---|---|---|---|
| Cameron Court Green-flesh ... ... | 1*s.* | 0*d.* | per packet |
| Queen Melon ... ... ... ... ... | 1 | 0 | " |
| Blackall's Green-flesh ... ... ... | 1 | 0 | " |
| Bailey's Green-flesh... ... ... ... | 1 | 0 | " |
| Bowood Green-flesh... ... ... ... | 1 | 0 | " |
| Beechwood Green-flesh ... ... ... | 1 | 0 | " |
| Windsor Prize ditto... ... ... ... | 1 | 0 | " |
| Emperor ... ... ... ... ... | 1 | 0 | " |
| Fleming's Trentham Hybrid ... ... | 1 | 0 | " |
| Duncan's Green-flesh do. Improved ... | 1 | 0 | " |
| Hampton Court Green-flesh ... ... | 1 | 0 | " |
| Egyptian do. do. Improved ... ... | 1 | 0 | " |

Any quantity of the above will be sent postage free to any part on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14. Abbey Church-yard, Bath.

---

TO MARKET GARDENERS AND NURSERYMEN.

TO BE SOLD OR LET, on very low terms, "THE GARDENS" at Newmarket, formerly belonging to the late "CROCKFORD, ESQUIRE," and stocked with the choicest varieties of Fruit Trees, regardless of expense. They contain 4 acres of the richest garden soil, sloping to a southern aspect, walled in on all sides, and include a Gardener's House and Yard, an extensive Vinery 100 feet in length, containing 3000 feet of glass, and replete with the best varieties of Frontignan, Muscat, Hamburgh, Muscadine, and other equally excellent kinds of Grapes in first-rate bearing condition. A second Vinery, 45 feet in length, equally well stocked with choice Grapes, and contains 1000 feet of glass. A third Vinery, 45 feet in length, stocked with Vines, as others, together with a large quantity of hard and soft-wooded plants, and containing 1300 feet of glass. The whole are provided with Potting and Store Houses, and are heated on an approved plan. There is also a range of 15 light Melon and Cucumber frames, and another of 12 light do. Any quantity of Land will be let with the Gardens for Nursery purposes.

The Gardens are situated close to the Newmarket and London Railway, equidistant 13 miles from the populous towns of Cambridge, Bury, and Ely, and afford an excellent opening to any one desirous of meeting with a first-rate Market Garden and Nursery Grounds.—For terms, apply to Mr. J. F. CLARK, Architect, Newmarket.

---

TO BE SOLD, in consequence of the death of the late Proprietor, a well Stocked and Established NURSERY with Dwelling-house, Hothouses, Stables and Outbuildings, in the immediate vicinity of Bristol; with a Shop centrally and eligibly situate in Bristol—well calculated to conduct a good Seed Business, &c. For particulars apply to Mr. THOMAS DIX, Solicitor, Small-street, Bristol.

---

THE APPROACHING COLD WEATHER.

THERMOMETERS FOR REGISTERING THE EXTREMES OF HEAT AND COLD, of the best construction, 1*l.* 1*s.* and 18*s.*; of the common construction, 15*s.*, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.* Night Thermometers for Registering Cold only, 10*s.*, 7*s.* 6*d.*, 5*s.*, to 2*s.* 6*d.* Thermometers for Baths or Brewing, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.*, to 2*s.* 6*d.* Hotbed Thermometers to 4 feet long, 25*s.*, 20*s.*, 17*s.* 6*d.* Steam pressure Gauges, 2*l.* 5*s.* and 2*l.* 2*s.* Rain Gauges, from 10*s.* Lactometers for showing the Quality of Milk, with instructions for use, 15*s.*, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.*, 5*s.* Hydrometers, for trying Sulphuric Acid, 10*s.*, 7*s.* 6*d.*, 5*s.* Barometers, Microscopes, Telescopes, Drawing Instruments, &c.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 90, Hatton-garden, London.

---

SIR JOHN SEBRIGHT'S BANTAMS. — A few couples of very perfect birds of the above breed, both of the Gold and Silver Spangled varieties, hatched in 1850, TO BE SOLD, and may be seen on application to the Gardener, Mr. D. BAILIE, Longcroft's Hall, Lichfield. Letters to be post paid.

---

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

---

DOUBLE ITALIAN TUBEROSE ROOTS.—The Bulbs of this most beautiful and fragrant Flower have been just received from Italy, at A. COBBETT'S Old-established Italian Warehouse, 18, Pall-mall; they are warranted double, and large and choice roots of which are selected at 4*s.* per dozen. N.B.—Orders by post punctually attended to.

---

FREEHOLD LAND TO BE SOLD, nearly adjoining the Uxbridge-road, a short distance beyond Kensington-gardens, and extending northward to the Harrow-road. The Great Western Railway passes through part of the property, the terminus being distant one mile from it. The property comprises 166 Acres, now held by a tenant from year to year, and is under cultivation as a Grass Farm, having a good House and suitable Outbuildings, but is admirably adapted for Building Ground, Nursery Grounds, or Market Gardens, the land to the south of part of the property lying between it and the Uxbridge-road being already built on, and a good road made through it. There is good Brick Earth on the estate. To be sold in one lot, or in separate lots of not less than 10 acres, at 100*l.* an acre. If small lots are taken for building purposes, they must be laid out on a plan to be agreed on as to roads, &c., across the entire property, so as not to interfere with the sale of other parts.

For further particulars, apply to Messrs. LOWE, Solicitors, No. 2, Tenfield-court, Inner Temple, London.

---

THE WEATHER.

BROWN'S UNIVERSAL BAROMETER, registered under the Act for Protection of Articles of Utility. Price 10*s.* 6*d.* An elegant and portable instrument for foretelling atmospheric changes, and ascertaining elevations. Constructed on the Torricellian, or most correct principle. Greatly simplified and improved, whilst the price is not a quarter that of an ordinary Barometer. Manufactured and sold by L. P. CASELLA and Co., 23, Hatton-garden, London, by whom also the trade is supplied, and may be ordered of all Opticians and Mathematical Instrument Makers.

---

HALL'S GARDEN NETS, of superior Lightness and Strength. These Nets are found to be a good protection against Frost, Hail, and Wind; also from Wasps and Insects. They are of great width, and very durable. Also valuable as outside shades to greenhouses, &c.

| | | | | |
|---|---|---|---|---|
| No. 1, 2, } | 56 inches wide... ... ... | 0*s.* | 6*d.* | per yard. |
| " 3. | " " close shelter ... | 0 | 8 | " |
| " 4. | " " thread leno ... | 0 | 8 | " |

GLASS SUBSTITUTE.

A very durable, strong, translucent, varnished Cloth, which, by being a slower conductor of heat than glass, maintains a much more equal temperature through the 24 hours, and protects the plants from chills and from scorching heats, with very beneficial results, at much less expense than glass. The width is 36 inches, hich fits most frames, and to which it is very easily attached. The price is 13½*d.* per yard.

P.S. It will be observed that No. 1 Net, of which there is the largest consumption, is only 4*d.* the *square* yard, or rather less. All the nets are 56 inches wide, and so made that two breadths can easily be joined.

AGENTS FOR SALE.—London: Mr. Benjamin Edgington, 2, Duke-street, Southwark; Messrs. Charlwood and Cummins, 14, Tavistock-row, Covent-garden; Messrs. Minier, Nash, and Nash, 60, Strand; Mr. J. Carter, 238, Holborn; Mr. W. Clark, 25, Bishopsgate-street Within; Messrs. Hurst and McMullen, Leadenhall-street: Messrs. Gordon, Thomson, and Co., 25, Fenchurch-street.—Peter Lawson and Son, Edinburgh; T. D. Watkinson, Market-place, Manchester; H. Bigland and Co., ditto, ditto; F. and J. Dickson and Co., 106, Deansgate, Manchester; John Shaw, 19, Oxford-street, Manchester; F. and J. Dickson, Chester; H. J. Oldroyd, High-street, Shrewsbury; Fisher, Holmes, and Co., Sheffield.

Manchester, Jan. 11.

---

SUBSTITUTE for GARDEN MATS, TARPAULIN, &c.—THICK SHEETING, dressed with a composition, admitting light to plants, and excluding frost, 6*d.* per square yard, or 1*s.* per yard, two yards wide. This is recommended for covering greenhouses, pits, frames, for fumigating cloth, preserving blossom of fruit, and also for shading in summer. It will outlast two mats, keep out more cold, give light, which is so desirable, and is nearly the same price as mat. Also tarpaulin, two yards wide, 1*s.* per yard, or half the width, 7*d.* per yard.—ROBERT RICHARDSON, Net, Tent, and Tarpaulin Maker, 21, Tonbridge-place, New-road, London.

---

WATERPROOF CAPES.—Second-hand Police Capes, fresh dressed, 1*s.* 6*d.* to 2*s.* each; New Capes, 2*s.* 6*d.*; old do., large enough to effectually preserve a man from wet while stooping down, 3*s.* each; Coats, 4*s.* 6*d.* to 6*s.* 6*d.*; India Rubber Surface Coats, 20*s.* each; Horses' Loin Cloths, waterproof, 7*s.* each, for Shaft-horses; do. for Fore-horses, 9*s.* 6*d.*, lined and strapped. Dog-cart driving Aprons, lined and strapped, 6 feet by 3 feet 6 inches, 12*s.* each, very soft and pliable. Waggon and Cart Covers, 2*s.* per square yard, made to any size.—R. RICHARDSON, 21, Tonbridge-place, New-Road, near Euston-square, London.

---

RABBIT NETS, SHEEP NETS, FISHING NETS. Long Hare and Rabbit Nets, on Cords, 50 to 100 yards long, for catching Rabbits, Shooting, &c., dipped in Kyan's Preparation to prevent Decay. Strong New Zealand Cord, or Cocoa-Nut Fibre, Sheep Nets, 4½*d.* per yard, 4 feet wide. All kinds of Fishing Nets, for Home Use, or Exportation, made by Machinery.—A. RICHARDSON, 21, Tonbridge-place, New-road, London.

---

WIRE FENCING, painted, an effectual fence against hares, rabbits, sheep, cats, dogs, deer, &c.; also for enclosing pheasants, fowls, &c.; for heightening existing walls, fences, &c.; and as a protection against petty thieves:—15 inches high, 3*d.* per yard; 18 inches, 3½*d.*; 2 feet, 4½*d.*; 3 feet, 6½*d.*; 4 feet, 9*d.*; and 6 feet, 1*s.* per yard; less than 2-inch mesh. Being worked in oil it will not rust when painted, and will last twice as long before it requires repainting as any other kind of wire-work that is made. Also, sparrow-proof wire-work, 2*d.* per square foot; wire-work, 4 inch mesh, ½*d.* per square foot. Wire-work to order. Numerous testimonials of approval.—R. RICHARDSON, 21, Tonbridge-place, New-road, London. N.B. As this wire kept painted would last 20 years, farmers and others may, at a small expense, preserve their crops from hares and rabbits.

---

WORSTED GARDEN NETS, 2½*d.* per yard, made of four-strand worsted, and strongly recommended to protect the blossom of fruit trees from frost, blight, mildew, birds, &c.; also new twine herring nets, 1½*d.* per yard, tanned or dipped in Kyan's Preparation to prevent the decay; old mended up herring fishing nets, tanned, ½*d.* per yard. The new garden nets may be had in pieces any width from 1 yard to 17 yards wide: also on sale, Bunting, and a strong net, which has given great satisfaction, being fine enough to protect ripe fruit from wasps and flies, in addition to a very effectual protection to the blossom of fruit trees in exposed situations, 6*d.* per square yard; green tie for flowers, &c.; nets for covering pheasantries, fishing, and sheep folding, constantly on sale.—R. RICHARDSON, Net and Tent-maker, 21, Tonbridge-place, New-road, London.

GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN SEED ESTABLISHMENT,

**For Supplying Genuine Home-Grown Seeds Carriage Free.**

JOHN SUTTON AND SONS, SEED-GROWERS, Reading, Berks, being extensive Growers of Seeds, and having many Customers in the Southern, Midland, and Western Counties of England, and in South Wales, have made arrangements with the Directors of the above named Railways (all of which converge at Reading), whereby they are enabled to deliver their Goods *Carriage Free* to any Station on either of these Lines; or to any Railway Terminus in London; or Packet Office in London or Bristol.

SUTTON'S NEW PRICED CATALOGUE OF HOME-GROWN SEEDS, being a careful selection of only the very best kinds of KITCHEN GARDEN, AGRICULTURAL and FLOWER SEEDS, *with prices affixed to each article*, will, it is presumed, be found the *most useful* and convenient of any yet presented to the public, the prices being remarkably low, while the sorts are the best in cultivation. *It will be sent post paid on application, enclosing one penny stamp.*

SUTTON'S COLLECTIONS OF GARDEN SEEDS.

*For the convenience of Gentlemen who may not be well acquainted with all the best kinds of Garden Seeds, and the proper proportions of each generally necessary to stock a large or small Garden,* Messrs. SUTTON *have during the last seven years been in the practice of making complete Collections for one year's supply, the economy and other advantages of which system have been fully appreciated by the purchasers, as indicated by numerous recommendations and annual increase of orders.*

The Collections are increased in quantity this year, and are far superior to any others yet offered to the public, both in quantity and quality.

| | £ | s. | d. |
|---|---|---|---|
| No. 1. A COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS FOR A LARGE GARDEN, for one year's supply | 2 | 10 | 0 |
| No. 2. A COMPLETE COLLECTION OF DITTO, in quantities proportionately reduced ... ... ... ... ... | 1 | 10 | 0 |
| No. 3. A COMPLETE COLLECTION OF DITTO, equally choice sorts ... ... ... ... ... ... ... ... | 1 | 1 | 0 |
| No. 4. A SMALL AND CHOICE ASSORTMENT OF DITTO ... ... ... ... ... ... ... ... ... ... | 0 | 12 | 6 |

Persons who are already in possession of several kinds of Seeds are requested to send the names, that they may be omitted in the collections they may order, and additional quantities of other sorts will be given in lieu of them.

*Choice Collections of Flower Seeds* may also be had, either all hardy or half hardy sorts, and will be sent carriage free with the above, or free by post if Flower Seeds only are required, viz.:—*The best 50 Sorts, 10s. 6d.; the best 36 Sorts, 7s. 6d; the best 24 Sorts, 5s.*

N.B.—*It is not necessary that remittances should accompany orders from Clergymen, Resident Gentlemen, or their Gardeners.*

Address, JOHN SUTTON AND SONS, SEED GROWERS, READING, BERKS.

PEAR AND QUINCE STOCKS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, St. Helier, Jersey, begs to inform the Public and the Trade that he has the following, of very superior growth, to dispose of:—A few thousands QUINCE, very free and healthy, fit to receive the buds next July, at 40*s.* per 1000; also PEAR Stocks, of superior growth, two years transplanted, and very vigorous, at 40*s.* per 1000; smaller ditto, transplanted, and very vigorous, at 35*s.* per 1000.

This is an opportunity R. L. has never before offered to the Public, for his stock is totally different from the French stock, which has always given R. L. superior growth of trees.—Orders will be punctually attended to. Reference or remittance from unknown correspondents.

The Gardeners' Chronicle.

*SATURDAY, JANUARY* 11, 1851.

MEETINGS FOR THE ENSUING WEEK.

IF the marvellous building now rearing its head in Hyde Park had no other merit than that of exhibiting what can be done in England under the influence of a fixed resolution, it would scarcely claim a notice in this part of our Journal; however worthy of admiration it might be, its structure would necessarily be left for discussion elsewhere. But it will be found, beyond all doubt, to have a most important bearing upon Horticulture, as, indeed, its garden origin suggests. When Mr. PAXTON constructed at Chatsworth the VICTORIA HOUSE, fully described in our last volume, page 548, he laid the foundation of a series of changes in the plans of conservatories, the end of which will doubtless be the gradual removal of all those lean-to, span-roofed, or upright fronted plant-houses with which gardens are now decorated. It will probably be found, too, that he will have introduced into very general use those winter gardens which so many have sought for and so few have found.

The difficulty that has hitherto been experienced in making a winter garden, has been its expense. The very term winter garden implies the enclosure of a considerable area beneath a glass roof; but the moment a large area is spoken of, the architect casts his eyes upwards, and insists upon the height bearing a certain proportion to the base. Tied down by the rules of his profession, he is unable to acquiesce in anything at variance with what he calls principles; he finds it indispensable that a greenhouse of any magnitude should be constructed upon the same rules as a Gothic cathedral, or a Greek temple; and the result is a large outlay, not for the benefit of the plants to be cultivated, quite the contrary, but for the support of a professional reputation, the true nature of which is mistaken. The supposed necessity of securing loftiness in a large conservatory, renders great strength indispensable in the roof, and in the walls that support the roof; this involves much cost, which being once incurred, of course leads to stone pavements, and carved fittings, and such other expensive adjuncts as are required to reconcile the interior with the magnificent exterior of the building. But that is no means all. A large outlay having been permitted in a cathedral or temple of glass, the proprietor is naturally unwilling to fill it with any other plants than such as represent a climate entirely different from his own; hence the tropics are ransacked for all that is singular, or unusual, or picturesque in their vegetation; but such plants insist upon a high temperature and a very peculiar atmosphere, in the absence of which they refuse to exist. And this compels the further introduction of costly heating apparatus; so that between massive brickwork, ponderous iron work, and a labyrinth of hot-water-pipes, it is fortunate if the building is prepared for receiving plants at a cost of less than a pound sterling per superficial foot of the area. We entertain no doubt that, in general, the expense is far greater. At this rate, a plant-house, 100 feet long and 30 feet wide, would cost 3000*l.* at the least; and it would require nearly 44,000*l.* to cover an acre in like manner.

But when we look at the Victoria House in Hyde-park, we find that about 18 acres are covered for less per acre than a quarter the sum above mentioned; and of this sum we apprehend that more than half has been on account of the galleries and aisles, required to produce the magnificent effect which we all so much admire. It is not heated, it is true, and for that an allowance must be made; but, giving any reasonable margin for heating, still the difference of cost is excessive. And it is to this that the attention of the country should be directed.

The true principle to observe in the construction of plant-houses should be, as we think, to depend for a fine effect upon the vegetation they enclose, and not upon the roof that covers it. If a grand architectural display is required, there is the mansion in which it may be properly sought; to attempt it in a plant-house, is a misapplication of skill, which usually ends in a costly abortion, too solid for plants and too flimsy for anything else. That being so, high roofs, with a wide span, should be discarded; the immediate effect of which is to obviate the necessity of massive walls and foundations. If in their place is substituted the cheap horizontal ridge and furrow roof, proposed by Mr. PAXTON, with the light columns that carry it, the main elements of expense disappear, heating becomes needless, perhaps, or, if needed, unexpensive contrivances may be substituted for the numerous water-pipes now in vogue, and an acre or two of winter garden beneath a Victoria house, falls within the means of every wealthy person, and of every large city, in the United Kingdom. Nor is the reduction of cost the only gain to be expected from these Victoria houses. The cost, such as it is, is reduced to a sum which is liable to no error. The price of one "square" being known, the exact cost of any number of similar "squares" is ascertainable; and thus we are left in no uncertainty as to whether the expense of our undertaking will be half as much more than the estimate, or twice as much.

To tenants the Victoria House will be peculiarly valuable; because it can be removed in pieces, and put together again with the same ease with which it was fixed. Whereas, from the manner in which plant-houses are now built, they are practically irremovable, and become the property of the landlord, in the absence of some special agreement to the contrary.

It may be true that Victoria Houses are not applicable to all the objects of cultivation. Perhaps not. But there can be no doubt that they will answer perfectly for four-fifths of the purposes sought in gardens. They will not do for propagating houses, nor for growing the difficult kinds of Orchids, nor for some of the more delicate operations of the gardener; but they will make admirable forcing-houses, greenhouses, conservatories, Vineries, and hibernatories—to which let us add orchard-houses—a new name proposed by Mr. RIVERS for buildings where fruit-trees may be cultivated in pots under glass.* In comfort and convenience they will prove infinitely preferable to the narrow spaces now occupied by greenhouses, because of the facility with which they can be made to extend over a considerable area. As to their internal management, it need differ in nothing from what is found necessary in the open air; gravel walks, lawns, shrubberies, will be as suitable as in the common flower-garden? In fact the difference between the Victoria garden, or winter garden, and an ordinary pleasure ground, will consist in the substitution of Camellias, Chinese Azaleas, Indian Rhododendrons, Cape Heaths, Pelargoniums, and New Holland plants of all sorts, for Laurels, Lilacs, and Phillyreas; in having crops of fruit secured against risk, and in the enjoyment of flowers and green leaves all the winter long, in exchange for mud, snow, hail, frost, and floral desolation.

---

IT is a principle with vegetable physiologists that a TREE of any age, or dimensions, may be safely TRANSPLANTED, provided its roots can be preserved, and mechanical means be found for lifting a mass so ponderous as a forest tree with the earth in which its roots are embedded. But the difficulties attendant upon carrying out the principle are such as to deter most persons from trying the experiment. Sovereigns, indeed, like LOUIS XIV., were at one time supposed to be the only persons able to undertake such costly operations; and hence, notwithstanding the occasional adoption of the process, the transplantation of large trees may still be called a rare occurrence, even in this climate, which is so especially favourable to its success.

That there really is no difficulty in the matter, except such as skill and adequate means can wholly overcome, is sufficiently proved by the extent to which the transplantation of large trees has been carried at Elvaston Castle, of which some account has been given in our columns. But people evidently think that Lord HARRINGTON'S success is an exceptional case; they do not put entire confidence in Sir HENRY STEWART'S results, and they feel alarmed at what that writer says of the issue of a great experiment tried at Edinburgh some years since, when the site of the Botanic Garden was changed. In the first place, as to the expense of the experiment, this writer says it would be needless, as well as invidious, to investigate that, as it could be no object in a royal institution; and, secondly, he speaks rather coldly of the result, when he merely says that "the removals were executed with a safety which could scarcely have been anticipated." The meaning which this was intended to convey is now explained in the notes to the third edition of the "Planter's Guide," page 386, where we are distinctly informed that although some things had succeeded well, yet that "the ordinary forest-trees on the other hand, such as the Lime, the Birch, and the Walnut, appeared by no means so successful, although powerfully supported with cordage." Faint praise like this, from the pen of Sir HENRY STEWART, it must be acknowledged, was not calculated to hold out great expectations of success in transplanting large trees, considering that the late Mr. M'NAB was the operator; and it must have greatly contributed to damp the ardour of those who would have been otherwise encouraged by the success said by Sir HENRY to have attended his own proceedings.

How general the feeling is, that no certainty attends the removal of old trees, was shown by the manner in which the public received Mr. PAXTON'S proposal to remove the old Elms in Hyde Park, which are now enclosed in the building there. It evidently was thought by some that the proposal was a boast, hazarded for the sake of removing an impediment in the way of the structure. But the thing might have been done last September just as easily as raising the first column of the building; that is to say, provided the rotten old trunks would have borne the strain that there must have been upon them in the act of removal.

The practicability of this has been finally set at rest, in a manner open to no question, by a large experiment in transplanting trees from 10 to 49 feet in height, at Amport House, near Andover, the seat of the Marquess of WINCHESTER. Mr. JOSEPH HOLMES, the gardener there, has published an account of the operation in a highly instructive paper in the new number of the Journal of the Horticultural Society. In this communication he describes with minuteness the method he pursued, the difficulties that occurred, and the final result of transplanting about a couple of hundred trees of

* We have not space on the present occasion to go into any description of these orchard-houses, but we shall certainly do so next week.

very large size from a sheltered valley to much higher ground. The trees consisted of

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Yews | ... | 7 | ... | from 10 to 24 | feet | in | height. |
| Oaks | ... | 18 | ... | „ 16 „ 27 | „ | „ | |
| Beech | ... | 60 | ... | „ 16 „ 49 | „ | „ | |
| Birch | ... | 3 | ... | „ 19 „ 42 | „ | „ | |
| Elms | ... | 22 | ... | „ 16 „ 36 | „ | „ | |
| Limes | ... | 5 | ... | „ 13 „ 36 | „ | „ | |
| Hornbeam | ... | 36 | ... | „ 30 (on an average.) | | | |
| Horse-chesnuts | | 25 | ... | „ 14 „ 33 | „ | „ | |
| Sycamores | ... | 28 | ... | „ 15 „ 37 | „ | „ | |

In all 204 such trees were planted, of which 199 remain. The only one which really failed is thus spoken of by Mr. Holmes. After pointing out the importance, as he conceives, of obtaining a good ball of earth along with the tree, to attention to which he attributes his success more than to anything else, and explaining the nature of the machinery used by him, which he is of opinion is attended with no risk, he adds: "It is in this and other respects that I consider the machinery employed infinitely superior to the principle of Sir Henry Stewart, for example. In transplanting upwards of 200 trees, not one of the number failed, and it was found necessary to sacrifice only one tree. The instance I allude to was that of a fine Beech, 42 feet high, removed on Sir H. Stewart's principle. The tree was rooted equally well with any of its contemporaries, but it had no ball; hence it was difficult to rear upright, and notwithstanding every care in propping, the first high wind laid it prostrate, when it was not considered worthy of further trouble."

His mode of proceeding, after the trees were deposited in the places intended for them, is described thus:—"In placing the tree on its new site, nothing more is necessary than to have a good hole made a foot or more wider every way than the roots extend. A roadway for the truck is cut from the natural surface to the bottom of the hole, and on the opposite side means are afforded for the horses to get out of the hole. The truck being in the middle of the latter, loosen the chain, take out the pole, bring down the head of the tree, so as to allow the edge of the ball to touch the bottom of the hole, then draw out the truck; and should the tree not have got quite an upright position, pull the ropes to render it so, at the same time packing the ball with fine soil, until it stands upright of itself. Every root that has been injured in taking up, should now be cut smooth, and every one laid out as straight and natural as possible, resembling the rays of a circle, great care being taken to pack fine soil firmly round the ball, and to surround every fibre with the best and finest soil, until every root is covered."

"Immediately after transplanting, every tree was *mulched* with old thatch, as far as the roots extended; and they also had a covering of about half an inch of straw around their stems, from 8 to 12 feet from the ground. This was done principally with the view of lessening the demand made upon the tree by evaporation. The straw was found to keep damp a considerable time after every rain. A ridge of soil was also placed around each tree, at the extremity of the roots, forming a sort of cup; and I have frequently seen water standing in these cups half an hour after heavy rain, during the second summer after planting, as by this time, from various causes, the mulch had disappeared, and the surface was firm, owing to the constant treading of sheep, which were allowed to feed among the trees during the second summer after planting, and which was, no doubt, favourable to them.

"No further care was bestowed or considered necessary; and no tree was ever watered, except during the first three weeks after transplanting, when the water-cart was used to most of the two groups of Hornbeam at the time they were in green leaf; and it was thought that thereby an early root action would be induced."

The precise fate of each tree is described by Mr. Holmes, in a set of tables, from which we gather two or tree striking facts. A Beech tree, 42 feet high, made wood 12 inches long the first year, and 7 inches in the two succeeding years; another, 48 feet high, made 8 inches in the first year, and 8 and 6 inches afterwards; another, 49 feet high, which did not make more than 4 inches of shoot the first year, made 6 the second, and 8 the third year (1850). The annual extensions in the three years since removal, have been thus in the following instances:—

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Elm | ... | 21 | feet high | 4 —12—13 | in. | | |
| „ | ... | 36 | „ | 3 — 2— 6 | „ | | |
| „ | ... | 29 | „ | 3 — 5— 6 | „ | | |
| Birch | ... | 42 | „ | 4 — 4— 6 | „ | | |
| Oak | ... | 25 | „ | 5 — 3— 5 | „ | | |
| „ | ... | 25 | „ | 4 — 4— 4 | „ | | |
| „ | ... | 26 | „ | 5 — 2— 3 | „ | | |
| Hornbeam | | 30 | „ | 3½— 6— 7 | „ | on chalk. | |
| Hornbeam | | 30 | feet high | 3½— 4— 4 | „ | in loam. | |
| Sycamore | | 36 | „ | 7 — 6— 6 | „ | | |
| „ | | 34 | „ | 3 — 2— 2 | „ | | |
| „ | | 37 | „ | 2 — 2— 3 | „ | | |

What is very important, with reference to the final issue of this experiment, is the present state of the roots, after three years' removal, and the late excessively dry autumn. We can state that their condition is in every respect most satisfactory. We have now before us fine fibrous roots, 3 feet long, taken from the Sycamore No. 16, 37 feet high, when transplanted, whose shoots lengthened 2 inches the first year, 2 inches the second, and 3 inches the third. This tree was transplanted Dec. 29th, 1847; it was taken from a very low, damp, dense shrubbery, surrounded by tall trees, and was transplanted to the most high and exposed part of the new park; apparently for 14 years the tree had had two leaders; one of these rival leaders were cut off in March, 1849. This tree was also affected by the wind more than any other, by reason of its heavy head, as compared with the stem. It was, therefore, a very good one to be subjected to a root examination, as no tree had to contend with such a number of unfavourable circumstances, or appeared to be doing worse. The roots, however, were found, on examination, to be an entire mass, similar to what we have described, in a hole of 11 feet diameter.

Let us add, that the operations now described were accompanied by only two peculiar advantages. There was the usual difficulty with country labourers, the usual failure of first attempts in using new machinery, and the disadvantage of removing trees from a valley to a hill, and from deep loam to thin chalk. The advantages alluded to were the ample means supplied by the noble lord, in whose park the work was done, and the incessant personal supervision of the gardener. Determined to deserve the confidence his noble employer placed in him, he made up his mind at the beginning, that whatever was done should be well done; therefore not a tree was planted but by himself, and not a root was cut and placed except by his own hand, or under his own eye. And that, we submit, accounts in no small degree for the success that has attended such operations wherever they have succeeded.

## MARKET GARDENING ROUND LONDON.

No. II.—Early Potatoes.—These being in great demand in spring, the following plan of producing them has been long practised by the London market-gardeners. The kind which Mr. Fitch cultivates is the true Early Shaw, a large and beautiful white-skinned Potato, whose only fault is its hollow eye. It is very prolific, either under hoops or in the open ground. The Ash-leaved Kidney was not grown to any great extent for market until my plan of managing it was made known, by which I caused it to produce as good a crop as any of the round ones, and it always fetches a better price. When Potatoes are wanted early, a long bed, 5 feet wide, is dug out to the depth of 2 feet. This trench is filled with hot dung, on which 6 inches deep of the surrounding mould is put. Middle-sized whole Potatoes are used for planting; they are placed in close succession along the bed, covered with two inches of mould, hooped and covered over with mats and straw. In about a month they will have sprouted; frames are then got ready, placing 2 feet of hot manure along the whole line of framing, which is sometimes a hundred yards in length; the mould is put on to the depth of 8 inches; the Potatoes are carefully taken up from the striking bed, all shoots are removed except the main one, and they are planted 4 inches deep. Radishes are then sown thinly over them, covering lightly with mould. When the haulm of the Potato has grown to about 6 inches in height, the points are nipped off; this is done, in order to give the Radishes fair play, and, although it may stop growth for a few days, still the crop is always excellent. The plants are never moulded up, a plan which weakens the Potato more than anything else. After planting, nothing more is required but to admit plenty of air, and give water; the crop is not dug up until it has come to maturity.

The above is the treatment frame Potatoes receive, but they are largely grown in hooped beds in the open ground. In the latter case the tubers are sprouted, as I have before mentioned. The beds or ridges are dug out 2 feet deep in January, filled with hot dung and covered with the surrounding mould to the depth of 10 inches. The Potatoes are taken up and planted 5 inches deep, and above all Radishes are sown. The ridges are then hooped over, allowing about 2 feet of space in the middle between the mould and the hoop. They are covered with mats and straw, but as soon as the Radishes come up they are uncovered daily, and covered again every night. This is continued till the Potatoes are ready for digging in May; for sometimes large losses are occasioned by a sudden change of weather on cold April nights. Nothing more is done to the hooped beds, beyond attending to them with water. Market gardeners were wont to cut all very large Potatoes for seed, but they are now getting more into the system of keeping the small ones for planting, and sending the large ones to market.

What are called winter or new Potatoes are the produce of old tubers kept back until July, and then planted. They grow very fast, but the crop never ripens before frost sets in; as soon as the haulm is cut down, large quantities of straw are put on the ground, and towards Christmas the tubers are dug up, put into 1 lb. and 2 lb. baskets, and sold for new Potatoes, at from 6*d.* to 8*d.* per lb.; they are as full of water as a Turnip, on account of the leaves being destroyed before the cells had time to become filled with starch. Cornwall Kidneys are the only ones used for this purpose. On examining one you will find the skin firmly attached, which is not the case with a new Potato, either grown in frames or in the natural ground. *James Cuthill, Camberwell.*

## BRITISH SONG BIRDS.

No. XIII.—Having now got safely over the *pons asinorum* of our subject-matter, including the building of an aviary, the purchase of "stock," the proper mode of preparing the birds' food, &c. &c.—we have henceforward to look on the pleasant side of the picture *only*. With care and attention, you will have very few deaths, very few casualties, and still fewer cases of sickness. In short, you will possess a "model aviary;" and find it a perpetual and inexhaustible fund of amusement.

I have already taken occasion (see my remarks in the Eleventh Article), briefly to direct attention to the fact of the human eye, and general expression of countenance, having considerable influence in the taming of birds and other animals; rendering them, moreover, affectionately-playful.

I have invariably found this to be the case; and, therefore, always make a point of attending to the aviary myself, *in propria persona*. It was no uncommon circumstance for a bird to perch on my head, my shoulder, my knee (whilst stooping), or on my hand, whilst engaged in cleansing the perches, &c. On such occasions, I made it an undeviating rule to notice these marks of affectionate regard, by giving him a fond look, and whistling him a lively tune; also, by offering him some "tid-bit" in the form of a mealworm, an earwig, a piece of ripe, soft Pear, or the leaf of a juicy Lettuce.

Emboldened by the familiarity of their fellows, and remarking that I never abused the confidence reposed in me, nearly the whole family would, after a while, eat from my hand. I have gone so far with many of them, as to take them up singly, while trotting about the floor; kiss them; play with them; and let them run away quietly from my half-open hand. They would as quickly return, and repeat the same ceremony; evidently much gratified with their "tiny" performances.

You will have unlimited opportunities for the indulgence of these reciprocal, pleasing familiarities; for you must enter the aviary every morning, regular as clock-work, to perform the requirements of the day. The perches must all be rubbed hard with a soapy flannel, and afterwards dried; the windows and looking-glasses must be wiped with a dry cloth, the floor must be cleansed from its impurities, the universal mixture must be fresh made; and the residue (if any) thrown into the poultry yard, the fountain cleansed, fresh water turned on, and, in short, a variety of other minor matters must be attended to, which will necessarily suggest themselves at the time.

I would here remark that all persons who *will* have fine birds, must be scrupulously exact in keeping their apartment clean; also in seeing to their toe-nails being kept properly cut, and their feet not clogged up nor fouled by dirt. Look to their "hoppers" and food-troughs, daily, and blow away the refuse of any seed that may remain on the lower ledge.

Be careful to keep a nice selection of Geraniums, Stocks, Calceolarias, &c., in the miniature balconies round the windows, and train your Ivy and other climbers over the upper parts of your windows. The birds will rejoice in an arrangement of this nature, and their song will be loud and continuous. You must also have, nailed on the outside of all your windows (at all events the lower panes), a strong galvanised wire-work frame—the bars sufficiently close to prevent the ingress of the cats, which would, otherwise, dash through the windows, and make sad havoc within. There is but one way of annihilating *these* vermin; to this I have already directed attention. (See Article No. 10.)

In selecting your birds generally, it is always advisable to prefer those of a quiet temper. This remark has reference, in the most pointed manner, to woodlarks in particular. These melodious little songsters are, for the most part, very wild, and very timid, knocking themselves about sadly, even at the reflection of their own shadow. They also have a bad habit of jumping up violently from the floor, when you go near them; especially when they are moulting. Their legs, I should observe, are fragile as the finest glass; consequently, they are liable to be easily broken. Woodlarks, of quiet habits, are a great acquisition in an aviary, where "harmony" is considered desirable. As they race along the floor, in the joyousness of their nature, they pour forth the most deliciously-plaintive notes. Many persons rank them as equal, some as superior to the Nightingale.

Skylarks will neither thrive nor sing in an aviary. Naturally accustomed to soar aloft, they are sure to dash their heads violently against the ceiling, and they cannot be taught to keep upon the floor. It is, therefore, quite useless to admit any of this tribe.

Should you, perchance, observe any wing-feathers lying about, watch narrowly who the offender is that has been thus spiteful; and if you find any recurrence of the outrage, remove him at once. There must be no insubordination allowed. When bringing in the daily

supplies of fresh food, &c., you will be much amused by closely watching the movements of the expectant guests. They will cling to the wires and feed freely from your hand.

If ever you purchase any *good* song-birds, whose plumage may be defective, simply press hard upon the stumps of their tails, and draw out the whole of the tail feathers, one by one. In less than a fortnight after they have luxuriated in the aviary, a new tail will be discernible in prospective, and in a short month their entire plumage will be beautiful. This affords abundant proof of the benefits derivable from air, exercise, and amusement. *William Kidd, New-road, Hammersmith.*

## GRAFTING.

No. II.—On the Affinity of Grafts and Stocks.—I shall only say a few words on the affinity of grafts with the stocks on which they should be worked, in order to assist in destroying the errors of some ancient authors, and which are still credited by some persons, who are led away with the false idea that they may successfully graft trees or other plants on each other, although these should have no family relationship. In consequence of this ignorance, it has been said, that in order to obtain black Roses, you must graft on the black Currant, and to have green, on the Box. They would also wish to persuade us that all trees will take on the Olive, and this on the Fig; the Vine on the Walnut and Cherry; the Peach on the Willow, and the Apple on the great Cow-Cabbage, &c. &c. Happily, our modern authors, and the enlightened men of our age, have entirely rejected these false assertions. It is now well known that, in order to graft with success any woody or herbaceous plant, it is necessary that the plant furnishing the grafts be of the same family as the stock; or, frequently, that both should belong to the same genus, or to varieties of the same species. There should also be some analogy between the saps of the two individuals, not only on account of their affinities, but also with reference to their proper juices. Thus we may graft, with success, the Plum on the Cherry, and *vice versa*, the Apple takes on the Pear, and *vice versa;* but although these genera are of the same family, nearly related, confounded, or united by some learned botanists, yet they rarely exist united two or three years. With regard to the vigour of the stocks, we prefer those that are strong and hardy for large trees, and the weaker for those of smaller dimensions. As to the persistence of the leaves, and the movement of the sap in the subjects to be united by grafting, it is in general necessary that they should nearly correspond. We have, however, some examples to the contrary. The Prunus Laurocerasus and P. lusitanica, both evergreens, live for some time grafted on the Bird Cherry, Prunus Padus, and are less sensible to the cold than those growing on their own roots. The Eriobotrya japonica and E. glabra, also evergreens, live a very long time grafted on the Mespilus Oxyacantha. The Cedar of Lebanon, Larix Cedrus, grafted on the common Larch, Larix europæa, lives upwards of 10 years, but it remains stunted and dwarf. There are other well known facts of this kind, which I need not mention here, as they only prove exceptions to the general rule.

Of the qualities which branches and shoots ought to possess when cut from the trees, and the means to be adopted for preserving their vitality.—Many authors recommend taking the shoots produced at the extremities of healthy vigorous trees. The theory which they develope seems to be conclusive. It must, however, give way to the subjoined observations. Some years before the first transfer of the *Ecole des Arbres Fruitiers du Jardin des Plantes*, effected in 1824, I was obliged to take grafts from more than 400 of these trees, of the different sorts, which were found to be in a state of complete decrepitude, often covered with canker, burns, &c. Such grafts put on healthy young stocks have all grown with remarkable vigour. These trees, from 20 to 26 years old, and of which many had attained the height of more than 36 feet, all bore fruit in prodigious quantity, and were free from original disease, when they fell under the axe in 1841.

The proper sorts of shoots for grafting and budding are not easily known by those not well experienced in the art. In taking shoots for buds, more especially, they make sometimes enormous blunders by cutting either too early or too late. In general the shoots ought to be of medium thickness, excepting those having slender wood, and in that case the thickest ought to be preferred; all ought to have made the greater part of their growth, in order that a considerable number of the buds on the lower part of the shoots may be completely formed, for such only should be reserved for budding, seeing that the bark adjoining these will be also in a firm state, for if the parts are too tender and too herbaceous when placed in the incision made in the stock, they are apt to be decomposed by the abundance of sap in the latter, which ought always to be in greater flow than that of the shoots which furnish the buds.*

The shoots of this description being separated from the trees, the herbaceous extremities are immediately cut off, as are likewise the leaves attached to the eyes reserved, taking always care to preserve at least one-fourth of their petiole.

The shoots should not be exposed to the free air, and they should be kept in a cool moist place till such time as they can be budded; but whatever means may be employed for preserving their vitality, we should avoid too close packing, in order to prevent the fermentation of the substances employed for that purpose.

We know that the moss of our woods (Hypnum) is very proper for this purpose. We, gardeners, often furnish ourselves with a large hollowed-out Cucumber, in which we place the shoots. In this situation they may be preserved in a good state for 10 days. If for a longer period, they must be put in a bottle, which must be filled up with honey, and then corked and sealed hermetically. In this state they will be preserved as fresh as possible during the journey.

Scions, for grafting in spring, are of course much more easily preserved than buds. For these they prefer the extremities of strong shoots, or any other part of which the thickness is about equal to that of a quill, and of the length of from 16 to 20 inches, with prominent eyes, not excepting the terminal, which ought always to be preferred, if it has not burst its envelopes.

It has been long remarked in many countries, that, in order to preserve grafts, especially for transportation, they ought to be separated from the parent tree before they have commenced to vegetate. In the climate of Paris, the month of February appears to us to be the best time for taking them off; they ought then to be placed in a northern exposure, in a horizontal position on the soil, and covered over with some of that adjoining, to the depth of about 2½ inches. They should remain in that position till their buds are well swelled, by which time the stock intended for their reception will be much more advanced, a necessary condition, as I have already explained. If the cuttings for grafts have to be sent to a distance, it is best to send them off as soon as they are taken from the tree. If the journey require only three weeks or a month, it will be sufficient to tie them up in packets, putting some dry moss between them, in order to prevent them from being bruised, and then insert their bases in a ball of moist clay, covered with fresh moss, the whole tightly enveloped in a thin coating of straw. But if the cuttings have to be sent to a great distance, so as to require several months on the way, they should be enclosed in a box, in small parcels, all laid with their tops in the same direction, their thick ends being covered with clay and fresh moss, the whole compactly fastened with laths likewise coated with moss. If for a long sea-voyage, care should be taken to close the box hermetically; but if not, some holes may be made in the top to prevent the shoots ftom becoming mouldy. I have sent grafts packed in this way to St. Petersbnrg, New York, &c., and they have always arrived in good condition. *Translated from the French of D'Albret.*

## VILLA AND SUBURBAN GARDENING.

To those to whom expense is of little importance, compared with ornamental effect, various modes of training Pears may be suggested; but whatever plan is adopted it will be necessary to procure in the first instance plants which can be adapted to the particular system which may be projected. For example, if it is intended to train in the form of a weeping fountain or umbrella, then the young tree must have a straight clean stem at least 5 feet high, which should occupy the centre of the circle, and this circle should have an iron frame fastened substantially upon stone or on brick and cement supports near the surface of the ground. When complete, this frame will exhibit an appearance similar to that of an ordinary striking glass. The system of training pursued in this device is to direct the course of the shoots downwards, placing them from 9 to 12 inches apart. This mode of training has been adopted in many of our best gardens, for it produces an effect in harmony with the geometrical lines which necessarily prevail in kitchen gardens. Another plan consists in inverting this form, selecting dwarf plants for the purpose, and in training the shoots upwards. Both plans have been found to answer, and the expense in either case is about the same. There are those, however, who prefer to have their iron frames made in the form of a cylinder, planting dwarf trees, and training the branches in a spiral manner. This gives a longer extension of branch, and fewer shoots are employed in training. I can bear testimony to this mode answering perfectly, and in a garden having high pretensions to artificial arrangement and skilful management; the effect is both novel and pleasing, and may be maintained at no sacrifice of the crop.

But the most important as well as the most economical arrangement has yet to be mentioned. It is well known that in hot weather, and especially when bright sunshine prevails, few individuals are tempted to visit a kitchen garden, owing to the absence of all shade, and the universal exposure to which they are subjected in it. Now, suppose that a centre or main walk runs north and south, with borders on either side. From these borders I would recommend an arch to be thrown over the walk, and the trees to be trained over the exterior of the trellis, which should form the arch, until the whole was completely enshrouded. This mode of training would be of great importance; for, instead of occupying the borders with the trees, the walk alone would be shaded. The advantages of the plan are—economy, the perfect security of the fruit, and the facility which it affords of protecting the blossoms from frost in spring. The flavour of the fruit, too, under these conditions, is very superior, at least in the majority of kinds; for they are exposed more freely to air and light on a trellis than against walls, and are less liable to become gritty. Experience and constant comparison for many years have fully confirmed this important fact, at least in the climate of London. *Pharo.*

## CULTURE OF THE CAMELLIA.

The beautiful glossy foliage of the Camellia, when in health, as well as its glorious flowers, deservedly gain for it a conspicuous place in every greenhouse; yet, notwithstanding this, I am afraid that, even in these enlightened times, amateurs are not so well acquainted with its management as they should be, and as, from the inquiries often put to you by them, I am sure they wish to be. To have Camellias flourish, something more is necessary than to put them into pots in finely sifted soil, to place them on our greenhouse stage, to water them when they are dry, and to allow them to remain in this condition otherwise undisturbed for years. True, if we give them air, the atmosphere—one of the sources from which plants derive nourishment—will perform its part; but does the soil, under the conditions mentioned, rightly effect its portion of the work? I fear not; and out of this arises all, or nearly all, the mischief of which amateurs complain.

The compost I have found best adapted to the growth of the Camellia is, a mixture of peat and loam in nearly equal proportions, together with a sprinkling of sharp sand. When the loam is light and sandy, less peat is necessary. These should be broken up, not sifted, intimately mixed, and the roughest pieces laid at the bottom of the pot over the drainage, which must be complete, or little success will attend your labours, even though all other conditions should be favourable. By complete drainage, I do not mean that this should be effected so much by crocks, as by the way in which the soil is arranged in the pots; for experience has taught me that the roots of the Camellia are apt to die among crocks alone when many are used; at least, I have found such to be the case. I put one large concave crock or oyster-shell over the opening in the bottom of the pot, with three or four smaller pieces round it, and over these the most turfy portions of the compost, in which the roots of the Camellia appear to delight.

Camellias will grow, and even flourish, in either peat or loam separately; they generally grow most luxuriantly in peat, and the foliage of plants in this kind of soil is of the deepest green; but I have not found them to flower so well. In loam alone the leaves are paler, and the plants are more liable to get into ill health. The utility of mixing the two soils, therefore, will be at once apparent.

The question, "How am I to restore my sickly plants to health?" is one often asked. When Camellias get into ill health, from whatever cause, the best plan is, to turn the plants out of their pots in spring, to examine their roots; and if these are found to be dead or dying, to shake the soil entirely away from them, removing at the same time all pieces that are dead. The top must also be well shortened-in, in order to preserve a sort of balance between that and the root. These things being done, place the plant in a pot just large enough comfortably to admit the roots, in a compost consisting of two parts peat to one of loam, using a little more sand than for plants in health. When potted, water, to settle the soil; place them in a gentle bottom heat, and keep them close; watering at the root but sparingly till the plants begin to grow, but frequently syringing their tops with tepid water. If they have made good roots by autumn, they may be either shifted into larger pots then, or in the following spring, when they may receive the same treatment as the general collection.

In regard to the best season for shifting Camellias, some diversity of opinion exists; some recommending that it should be done in spring, others that it should be performed in autumn. I have tried both seasons, and with nearly equal success; but, as a general rule, I prefer spring-shifting.

It has been correctly stated that the Camellia is not a greenhouse plant; nevertheless, although this is strictly true, it succeeds best when treated as a hardy greenhouse shrub. If it be kept in a temperature above freezing, it will thrive better than if grown in a warmer atmosphere. Camellias, however, like an increase of warmth and plenty of moisture when they are making their new wood; and to ensure a good display of bloom, this latter must be thoroughly ripened. After they have ripened their wood and set their flower-buds, they may be placed in the open air, or retained in the greenhouse, according to circumstances. If kept in the greenhouse, as much air as possible should be admitted, and the foliage may be occasionally sprinkled with water, which will keep it clean and healthy. On this latter point much depends; for it is in the leaves that the sap, under the influence of light, undergoes those changes in its composition by which it becomes capable of forming the various compounds required in the plant's economy. The roots, too, must be kept in a proper state as to moisture.

In cases in which it is not convenient to use large pots, Camellias may be kept in health by watering them occasionally, during their growing season, with weak liquid manure, which will in some measure restore to the soil the fertilising qualities of which it has become deficient.

It now remains for me to speak of propagation, which is, however, more the province of the nurseryman than of the amateur; and yet so much interest attaches to the offspring of one's own handiwork, that, for the benefit of those who like to amuse themselves in this kind of employment, which is as instructive as it is pleasant, I will add, that Camellias are increased by

* I am anxious to impress upon my readers the necessity of paying particular attention to this observation; it is general for all the operations, and I shall pass it over when I come to treat of them.

inarching, grafting, and budding on the single red and Middlemas red, cuttings of both of which strike readily. These latter should be taken off in August or September, as soon as the young shoots are ripe. They are prepared by being cut through horizontally at a joint, or better taken off with a "heel," divesting them of a few leaves at the base, and potting them in sand. They should then be well watered, and the pots placed in a cold frame for a month or six weeks. They may then be introduced into a gentle bottom heat, and potted off into small pots next spring; still keeping them in heat until they have made their growths, then gradually hardening them off. In the succeeding season they will be ready to be inarched, budded, or grafted. The best time for inarching is in the spring, just before the plant begins to grow; and for grafting, in August or September. *J. M. H.*

## Home Correspondence.

*Roses.*—I consider that the following deserve a place in "Crito's" list of "continuous bloomers," viz.: 1. Hybrid Perpetual, Comte d'Eu, than which no Rose with me is more brilliantly vivid in colour, or more lasting in bloom. I had good flowers here (Nottinghamshire) on one of my trees the second week in November. 2. Hybrid Perpetual, Ernestine de Barante justly called by Rivers "a perfect gem," as beautiful as bountiful of its sweet fairy flowers. Well grown on a half-standard tree, where shall we find a more symmetrical or constant bouquet? 3. The Grenadier (Bourbon) so conspicuous in a Rose-garden, on account of its splendid colour in the bud, and so brave, like its namesake, to resist the advance of its enemies (winter and Jack Frost)! 4 and 5 of the same family—Dupetit Thouars and Comice de Seine et Marne—two of the best and most continuous. I had blooms of the latter in my button-hole (side by side with *la belle* Mrs. Bosanquet) the greater part of November last. 6 and 7, to these I would add Devoniensis and Comte de Paris (Teas). They are both hardy (for out-door culture I prefer them worked on the common briar), and what can be more beautiful? The former makes one feel that though the English growers have not originated many new Roses, they may speak of this, as the lioness of her single offspring, "it is a lion;" and I quite commend Messrs. Curtis for placing it A 1, in their elegant publication. Thanks to "Crito" for reviving the "wars of the Roses," so far as the catalogue-nuisance is concerned; and thanks to Mr. Rivers for his most judicious pruning. I must say that I cannot find in his catalogue one Rose which has not some distinctive claim to commendation. *S. R. H.*

*Remedy for Bleeding in Vines.*—In the case of a large limb being removed, nothing more is needed to stop bleeding than to rub the fresh cut over with a little tallow. I was led to adopt this plan from seeing a plumber use a tallow candle to stop a leak in a water-pipe, which it did effectually. *A. Melross, Ardgowan.*

*Fountains for Aviaries.*—In reply to your correspondent, "Jay, Somerset," who deprecates the use of zinc fountains in aviaries, I would remark, that I had two of them in daily use for 12 years, and never experienced any ill effects from their introduction. Quite the contrary. I have also been in the habit of drinking water myself, supplied from a cistern of zinc, which is considered, generally, as far superior to lead. Not being a practical chemist, I cannot go minutely into the "why and because" of the subject. I simply state "facts," which are said to be "stubborn things." It is somewhat singular—is it not?—that dogs, hounds, &c., are, for the most part, supplied with water conveyed to them in troughs of zinc? *W. Kidd, New Road, Hammersmith.*

*Heating.*—I had lately occasion to pass through Guildford, where I saw, in Mr. Penn's shop, in High-street, a model of an excellent heating apparatus for horticultural purposes. It consists of an open tank for bottom heat (or close if required), which sends up a congenial heat, and at the same time warms a range of pipes round the top of the bed. It was heated by means of a jet of gas, and its action was perfect. The amount of fuel required must be trifling, for the boiler was not more than 5 inches in diameter, and it was set so as to be nearly enveloped by the fire. I understood Mr. Penn to say that he had erected many in the neighbourhood. One gentleman, I know he told me, had three. I had no time, or I should have examined one of them; but I am so satisfied with the contrivance that I intend to give it a trial; as I imagine that Grapes, Pines, Cucumbers, &c., can be grown easier and cheaper by it than by any other plan I have seen. *Charles Phillips, Ealing, Hants, Jan. 6.*

*Grafting Cacti.*—I have observed, in the *Sydney Morning Herald*, an account of a very fine specimen of Cereus flagelliformis, measuring, if I recollect right, 360 feet, and the growth of only three years. I have seen this specimen and many others grown by the same person, and I may say that he is the most successful grower of the commoner varieties of long Cacti that I have ever met with. Brown, the man I speak of, grafts, as does everybody else here, on Cereus triangularis, and I doubt not but that if tried in England it will be found a far superior stock to C. hexagonus or any other of the slow growing kinds. Cereus triangularis is a very common species out of England, in consequence, I suppose, of its extremely hardy constitution and rapid growth; and I would recommend growers of trailing Cacti in England to try it as a stock as soon as possible—it will bear great heat, considerable coolness, any amount of wet (above ground), and in rich soil will make a shoot of 6 feet, from a cutting of 6 inches, in one season. The gardener, Brown, who possesses the above-mentioned specimen, has a method of inserting the graft, which appeared to me quite novel, and at the same time successful—it amused me very much when I first heard of it; he bores a hole with a gimlet (!) in the stock and therein inserts the graft. On trying Brown's plan I found it extremely difficult to retain the graft in the hole, in consequence of the confined air forcing it out, and therefore invented a plan which effectually removed the difficulty; it consists in inserting with the graft a fine tube—the hollow culm of a Grass will do, and therewith sucking out the inclosed air and liquid; when the tube is withdrawn the graft is retained, as the dentists say, "on the atmospheric principle," and requires no bandages to keep it in its place. My advice to gardeners in England who wish to procure gigantic specimens of slow growing Cacti in a short space of time, is therefore to procure plants of Cereus triangularis, plant them in any rich soil, give them plenty of heat and water; when high enough stop the shoots in order to make the angles thicker, at last graft as above, at a time when the stock is attempting vigorously to sprout at every eye. As I cannot find the paragraph above alluded to, and as I may be mistaken as to the length of the stock, I send you the dimensions of a plant of my own, grafted about six months since. The stock was about six inches long, and had been separated about six months previously, but had been starved until shortly before it was grafted; it was then planted in the hollow stump of a Eucalyptus, filled with about equal parts of loam, white ants' nest (a cellular matter of vegetable origin), and sheep-dung, with about one-tenth part of burned sheep-bones intermixed; the whole well rammed in, in order to facilitate the decomposition of the dung and to prevent shrinkage. The graft was of the hybrid called C. Mallesonii, and was about 3 inches long. There are now 17 shoots, all pushing at the tips; eight of the largest are from 12 inches to 15 inches long, and none of the rest less than 8 inches. The original plant with 3 shoots of about 6 inches each, was planted in the stump at the same time as the stock, and has barely replaced the shoot I took off it to graft. By-the-bye, in this climate mid-winter appears to be the time when C. speciosissimus and C. flagelliformis make all their growth; C. Mallesonii also, of course; so also Epiphyllum Ackermanni. This place is in S. lat. 25·30, and there is occasionally real frost in the flats, but not enough on the hills to touch the Sweet Potato vines. *J. C. Bidwill, Tinana, Maryborough, N. S. Wales.*

*Rain.*—The monthly depth for the past year, according to my rain gauge, is as follows:

| | Inches. | | Inches. |
|---|---|---|---|
| January ... ... ... | 1.28 | August ... ... ... | 1 91 |
| February ... ... ... | 0 99 | September ... ... | 1.08 |
| March ... ... ... | 0.60 | October ... ... | 1.77 |
| April ... ... ... | 1.43 | November ... ... | 1.98 |
| May ... ... ... | 2.25 | December ... ... | 1.46 |
| June ... ... ... | 0.61 | | |
| July ... ... ... | 1.89 | | 17.25 |

The fall of rain last year is the smallest I have ever noted. In the remarkably dry season of 1847, the quantity here was 17.60 inches. *Henry Dixon, Dorwards Hall, Witham, Jan.* 1851.——The popular belief here is, that this locality is dry; but by comparing the following table with that furnished from Chiswick, it will be seen that instead of this part of Sussex receiving less rain than the average quantity which falls at other places, the contrary is the fact; for we have annually more rain than the neighbourhood of London by from 8 to 15 inches.

| | 1846. | 1847. | 1848. | 1849. | 1850. | Mean. |
|---|---|---|---|---|---|---|
| | In. | In. | In. | In. | In. | In. |
| January ... ... | 5.50 | 2.37 | 2.10 | 2.77 | 1.00 | 2 748 |
| February ... ... | 2 30 | 1 62 | 5 07 | 2.32 | 2.96 | 2 974 |
| March ... ... | 2.16 | 1.22 | 3 94 | 0.52 | 0.50 | 1.608 |
| April ... ... ... | 2.18 | 1.14 | 3 35 | 4.00 | 3.65 | 2 854 |
| May ... ... ... | 2.07 | 2.29 | 0.41 | 3.46 | 3.59 | 2.364 |
| June ... ... ... | 1.12 | 1 95 | 4.65 | 1.31 | 2 24 | 2.240 |
| July ... ... ... | 2.34 | 0 71 | 4.66 | 2.21 | 2 09 | 2.522 |
| August ... ... | 4 39 | 2.02 | 4 88 | 0.74 | 3.32 | 3.070 |

—*A. D., Dale Park, Arundel.*

*Destroying Scale.*—I have found two parts boiled, and one part raw Linseed oil effectual in eradicating the mussel scale. I use it in a cold state. In cleansing Pear and Apple trees, I loosen them from the wall, and carefully anoint every part with the oil, which must be dry before the trees are again nailed to the wall. Apply it with a painter's brush. *J. Johnston, Gledston Gardens, Skipton in Craven.*

*Poinsettia pulcherrima.*—All who have a stove should cultivate this plant, whose beautiful floral leaves or bracts create a gay appearance for about three months during the dullest time of the year, and even a small piece introduced into a bouquet is sure to be admired. When I cut down an old plant, in January or February, I select for cuttings those portions on which the eyes are placed rather closely together, and make them into lengths of about a foot, each having six eyes. I insert the cutting over the two lowermost eyes into a tan bed, in which Pine-apples are grown. The eyes above the tan will generally all have pushed by about April, and by that time roots will have been sent out from the lower eyes. I then take the plants up carefully, and pot them, shading them from the sun for a week or so; when they have become well established in the pots, or about Midsummer, I pinch the tops off the young shoots, which induces them to double their number, each shoot breaking at the two uppermost eyes. I now encourage them to grow vigorously by giving them plenty of heat, air, water, and root-room. I pot them in a mixture of loam, peat, and manure, in equal parts, and keep them growing on until November, when they begin to show their bright crimson bracts, and they remain objects of great attraction during the winter. I have a plant at the present time with eight heads, or bunches, of red leaves on it, each head measuring from 12 to 20 inches across. The temperature I grow it in varies from 55° to 70° in winter, and from 65° to 90° in summer. *I. Rust, Pashley, Ticehurst.*

*Grafting.*—Your commencement of a series of articles on this subject leads me to suggest that nurserymen would serve their own interests by selling scions or cuttings of the different varieties of fruits, as well as worked plants. Many a man has healthy established trees of second-rate kinds, which he would grudge to root out, but which he would gladly cut back and graft with better sorts, if he only knew where scions were to be procured. His only resource at present is to go a-begging from his neighbours, from whom he perhaps does not obtain the varieties he would like, and would willingly pay for, but something that at least promises to be better than his own. If scions were to be had at the nurseries, they would not only be in demand for such purposes, but there would be an opportunity of testing the fitness for different soils and climates of many of the new varieties of fruits lately introduced, by inserting grafts on the branches of established trees, before taking the hazardous and expensive plan of throwing away old trees to be replaced by new and untried kinds. If Mr. Rivers, or some other of our leading nurserymen, availing themselves of the facilities afforded by the Post-office, would advertise scions at—say 3*d.* or 6*d.* each—free by post, newer sorts being higher in proportion, I have no doubt that a good deal of money might be made of what at present goes to the rubbish-heap. *A Scotchman, Ford.*

*Effect of different Localities on the Flowering of Plants.*—I am on the red marl of the coal measures, but well drained; the garden soil of course has not too much clay; now, I never get a flower on any of my English Irises, or any broad-leaved flags. Can any of your readers give me a probable cause of their failure? Their situations are various, and none over damp, dry, or sunny, &c. Near Wells they cannot flower the Tropæolum tuberosum well, whereas, with us, it has literally as many flowers as leaves, and yet it is a very rare plant; one root will cover as much wall or trellis as a Cobæa and Maurandya together. If any of your readers fail in their attempts to flower this very beautiful creeper, let them mix some marl with the soil, and plant late in April. *Jay, Somerset.*

## Societies.

ENTOMOLOGICAL, *Jan.* 6.—The President in the chair. Various donations to the library were announced from the Royal Agricultural Society, the Linnean Society and the Society of Arts and Sciences of Lyons; and also the new Catalogue of British Macro-Lepidoptera, printed for the British Museum by Mr. J. F. Stephens. Additions to the museum were presented by the Rev. Mr. Kuper and Mr. F. Smith. Mr. S. Stevens exhibited fine specimens of both sexes of the rare Dynastes Jupiter from Columbia, and also an exotic moth within which a parasitic Tinea had been reared, the cocoon of which was attached to the head. Mr. Thomas Allis exhibited a specimen of the very rare Drepanepteryx Phalænoides, from Bowness. Mr. Douglas stated that since the last meeting he had observed several instances of the occurrence of the curious small Lepidopterous larva, which forms a movable case of the dried flower-buds of Origanum, so exactly resembling the buds as to escape ordinary notice. Dr. Wallich, F.R.S., read a translation from the Transactions of the Royal Danish Academy of the remarkable memoir of Dr. Schiodte on the subterraneous Fauna of the Adelsburg caverns in Illyria, the mammoth cave in Kentucky, &c., the great peculiarity of which consists in the want of eyes of almost all the species of animals of which it is composed. In addition to the singular Proteus anguinus, several Crustacea and beetles had been previously observed in Europe, whilst in America several blind species of fish had also been observed, and a considerable number of Crustacea, spiders, and insects. Dr. Schiodte had himself investigated the Alpine caverns, and had succeeded in detecting several most remarkable Crustacea, Arachnida, and insects, the minute description of which, with observations on their physiology and relations, formed the chief subject of the paper translated by Dr. Wallich. One of the species of Coleoptera is especially interesting, as it forms the type of a new and distinct family allied to the Silphidæ. —Papers were also read by F. Walker, Esq., on six new British Dipterous insects; by Mr. Dallas on the genus Acanthosoma (one of the Pentatomideous Hemiptera), with descriptions of four British species; by Mr. Douglas on the genus Gelechia (belonging to the Tineidæ, including Tinea cerealella, a species destructive to Cereals); and by Mr. Stainton on some new species of Gracillaria, a genus of Tineidæ.

BOTANICAL OF EDINBURGH, *Dec.* 12.—The President in the chair. Office-bearers for the ensuing year were elected. Several donations to the library and museum were announced. A specimen of Anastatica

hierochuntina, or Rose of Jericho, was exhibited, and a stem of Agave from the Mauritius. Dr. Balfour gave an account of a botanical excursion which he had made in company with the Rev. Mr. Drummond to Ben Chonzie and other mountains near Crieff, in October, last year. The following communication from Mr. C. Lawson, jun., relative to the growth of the Tussac Grass (Dactylis cæspitosa), in Orkney was read. Mr. Traill, of Woodwick, in Orkney, has been the most successful cultivator, and from a letter written by him, I proceed to give the under-mentioned particulars regarding his method of culture:—In leisure time, previous to June, some pasture ground is selected and trenched. During the first week of that month Turnip seed is sown in drills 4 feet apart. So soon after as wet weather sets in, Tussac Grass plants are dibbled in between the rows of Turnips, at a distance of 3 feet apart. After the Turnips are removed for use, manure is wheeled in and Potatoes set on the same ground. By adopting this method of culture, the Tussac is cultivated with no expense beyond the outlay for the plants and the labour of dibbling. The work requisite for the two intervening crops is found to be quite sufficient to keep the Tussac plants clear, after which they need no further care, and speedily close up the rows. Where practicable, however, it would be much better to commence with a field previously manured for Turnips, by which a saving of the ground in wheeling manure during winter would be effected. Mr. Traill thus sums up the advantages of the Tussac: 1. The enormous produce of a highly nutritive food for cattle. 2. Having this food every day in the year equally plentiful. 3. The conversion of a poor unproductive field into the most productive of the whole farm in two years, without outlay beyond the plants themselves. 4. The ease with which it can be cut and carried off in snowy weather, and the certainty with which a farmer can count his supply of fodder. 5. When cut down for use, it recovers its bulk in two months in winter, and in about five weeks in the summer. During the four years, over which Mr. Traill's experiments extend, the plants have been steadily increasing in height, and at the present time, the oldest ones have attained 7 feet. When not cut, Mr. T. notices that the leaves continually augment in number, length, and breadth, whilst about a fourth of the older leaves gradually turn yellow and dry up, become brittle and fall to the ground. It is somewhat remarkable, that this decay does not take place at particular seasons, but is progressively developed throughout the year. January is the time of flowering, but the flower-spikes are fully formed in December, generally during the first week. While the necessity of procuring strong and healthy plants will naturally suggest itself to all, the cultivator must bear in mind, that it is necessary to the vitality of the plant, that it be kept free of weeds for at least two years. This, Mr. Traill very satisfactorily proved last year, by selecting 12 fine healthy plants, and sowing Rye-grass around them. As the Rye-grass got up, one-half of the Tussac was completely killed, and of the remainder, scarcely a single plant can be discerned. As to soil in which the plant is grown, Mr. Traill gives the following, progressing from the best to the worst:

1. Dry sandy peat.
2. Wet do.
3. Any dry sandy soil.
4. ,, wet do.
5. ,, dry peat do.
6. ,, wet do.
7. ,, dry peat and earth.
8. Any wet peat and earth.
9. Dry peat and clay.
10. Wet do.
11. Dry friable clay.
12. Wet do.
13. Dry stiff retentive clay.
14. Wet do.

Mr. Traill's soil, generally speaking, is of the very worst kind; but he overcomes this disadvantage by mixing sand, peat, and retentive clay. The specimens sent to the Botanical Society were grown in the worst kind of soil. The principal objection to this soil is, that the plants, perhaps a tenth, die out the first year, and sometimes a few in the second. If they survive this period they thrive quite as well as those grown in the better soils. Mr. Horsburgh, of Tongue, one of the factors of the Duke of Sutherland, has, at the request of his Grace, also instituted a series of experiments with the Tussac, which, however, in their results, are somewhat different from those of Mr. Traill. Mr. Horsburgh obtained from us in 1846 two plants of the Grass, which "tillered out," to use his own words, "beautifully." In the following year, by a division of the roots 60 plants were obtained, which were planted in his garden at Tongue. In 1848 the plants were again divided, and a portion of them dibbled into mossy ground, exposed to the influence of the sea spray. In the year following (1849), all the plants, with few exceptions, flowered and produced abundance of apparently good seed, which was sown in August of the same year, but did not vegetate. In December, the plants in the garden were cut, and the Grass given to cattle, who devoured it greedily. In the spring of 1850 a number of the plants which had been cut, withered away and completely "died out." A few of the healthy plants were again divided, and set in a patch of sandy ground near the Ferry at Tongue (west coast of Sutherland), and at the present date are reported to be healthy and thriving. Very few of the plants in Mr. Horsburgh's garden bore seed this year. A portion of last year's seed, which was saved for further experiment, was sown in June of the present year and vegetated freely; but in consequence of being hoed up by an ignorant lad, the result of this experiment cannot be known. Mr. Horsburgh states as the result of his observation that the Tussac thrives best in rich garden soil, where its growth is very luxuriant, while on poor mossy land the plants thrive very indifferently. The greatest length of blade of Mr. Horsburgh's specimens was 6 feet; but the average was only between 4 and 5. All the plants stand the winter very well. Mr. H.'s gardener is inclined to attribute the decay of the cut plants to the nibbling of mice, which little animals not only lived upon them, but constructed their nests at the base of the thick bushy tufts. —Dr. Balfour read a communication from James Backhouse, jun., York, relative to rare alpine plants picked by him in the Clova, Glen Isla, and Braemar districts. Mr. Anderson gave a short account of the Flora of the district around Clonmel. There was exhibited from Mr. Murray, of Henderland, a specimen of Rhodoleia Championi, brought from Hong Kong, by Captain Champion. The plant is very showy, and belongs to the natural order Hamamelidaceæ. Mr. Storey presented a specimen of Quercus intermedia, Don. He also sent for exhibition a specimen of Naias flexilis, picked by Mr. D. Oliver, jun., in Ireland. Several new members were elected.

## Reviews.

*An Arctic Voyage to Baffin's Bay and Lancaster Sound, in Search of Friends with Sir John Franklin.* By R. A. Goodsir. 8vo. Van Voorst, pp. 152.

Mr. Goodsir sailed for the Arctic regions in March 1849, in search of the unfortunate expedition, in which he had a brother. Although his attempt was, like so many others, unsuccessful, it enabled him to collect some curious facts respecting the natural history of the icy seas; and this he illustrates in the simple, unaffected, and interesting narrative before us. Criticism on such a book is misplaced. Extracts are all that we feel entitled to indulge in.

To the oft-repeated tales of whale fishers, the following may well be added:—

"We captured one middling-sized whale off this bay, and then slowly worked our way southwards. For some time we saw nothing worthy of notice or comment. A little to the southward of this, however, a few days afterwards, we fell in with a 'run' of fish. It was about mid-day, the water was very free of ice, and a good deal of sea was running, there being a sharp breeze. Three of the boats were lowered, and they had a pretty good tossing about for some hours, but were completely unsuccessful. It moderated, however, as the afternoon wore on, and we were again rejoiced to see the horizon broken by the spouting jets of numerous whales. A large 'sconce,' or rather small floe, lay some distance a-head —round this they were playing in dozens. All sail was crowded on at once, though there was a strong breeze blowing; but there being three or four other vessels in company, it was, of course, necessary to be a-head of them. This we accomplished in gallant style; the good old 'Advice,' when well handled, clumsy as she looked, could still sail well; and, indeed, throughout the whole voyage, when we were in company with the others, I think we showed as good a pair of heels as any of them.

"Well, we got into the midst of the black floundering masses; one, two, three boats were in an instant lowered, and in five minutes one of the largest of the oily giants was writhing and struggling under the tortures of a deeply-planted harpoon,—'she' made rather a long and hard fight, but was ultimately subdued.

"In the mean time, all the other vessels had 'got fast,' each had secured his whale, but the rest of the fish had beat a quick retreat. Interested as I was in the success of our own boats, I could not help enjoying the interesting scene that was going on amongst those of the 'Truelove;'—they had got fast to a large whale, but she showed better fight than any I had as yet seen. For some considerable time she lay on the surface, never diving, raising her huge tail and rump high out of the water, and lashing it into a foam, that even at the distance I was, seemed like that at the foot of Niagara. The boats during this time lay at a respectful distance; but soon the immense animal getting exhausted, one after the other cautiously advancing, drove their weapons into her, and she was soon thoroughly vanquished, when the happy conquerors found themselves possessed of more 'blubber' than their ship could well stow, as they had previously been very fortunate."

Even in the whale ships it appears that horticulture begins to be practised; and we should not be surprised to hear that in some future expedition, a regular Cabbage-garden had been established. Mr. Goodsir speaks with exultation, as well he might, of the early Potatoes which Captain Penny's ship rejoiced in.

"It may appear rather strange that we should have early Potatoes on board ship within the Arctic circle, but for upwards of three months, from June to September, we had every day more than a quart of them at dinner. A large supply of excellent Potatoes had been put on board at Dundee, a good deal of mould being amongst them, and the place where they were stored being not far from the stove, and under the water, they had sprouted, and formed young tubers. The steward having informed us of this, orders were given that he should be careful in removing the daily supply, and rather to encourage than interfere with the growth of this unlooked-for delicacy. They were about as large as a pigeon's egg, and exceedingly good—better, indeed, than forced early Potatoes at home. As I am upon the subject of eatables, I may mention that the captain and I not unfrequently indulged in a broiled whale steak, and broiled whale skin, both of which are very fair eating, indeed, and which, if it came to be a matter of necessity, I should think excellent."

The death of a whale, 65 feet long, is thus narrated:—

"The stern-boat was the only one now left on board. The master ordering it to be lowered, and getting into it himself, I jumped in with him. We pulled up to the "fast boat," to see how things were getting on, and found they were only fast with the gun-harpoon, and not very well with that. Whilst talking to the harpooner of this boat, we heard a commotion amongst the others, and almost before we had time to turn, bang! went one of their guns, and the fish was made almost secure. She seemed to dive under the floe, and reappeared almost at the same place, for she next came up within a very short distance of where she was first struck, when a third boat got fast to her, and before she dived again, she was mortally lanced. When she next appeared at the surface, it was close to our boat; we were at her in a minute, when the ready lance of the master was twice buried deep behind her fin. She made a rush forwards, which pulled the lance out of his hand, but he soon had a second—we 'hardened up' to the fish, when he plunged it into her side. She had been quiet enough hitherto, but it was now full time for him to cry, 'Back, men, for your lives!' I heard a sudden whizzing, whistling sound in the air—I thought a black cloud had passed between us and the sun—a drenching shower of spray passed over us, and there was a loud *thud* upon the water on the other side of the boat, as her huge tail descended into the sea, which it continued to lash into seething foam for more than five minutes. It may be believed that whilst this was going on we all kept at a safe distance. It was, however, only the last struggle—'the dying flurry,' and the huge mass was soon lying powerless and motionless before us. This was a female whale, and one of the largest we had yet seen."

## Miscellaneous.

*Death of Mr. Wilmot, of Isleworth.*—We regret to announce the death of Mr. Wilmot, which happened on the 2d inst., and in the 74th year of his age. As a market gardener, no man in his time held so prominent a position. From early youth, to the day of his decease, he evinced an ardent enthusiasm in everything relating to gardening; for although it is well known that he pursued his profession most successfully and profitably, yet no cultivator for the market ever expended so much as he has done in mere experiments. He tested the efficiency or inefficiency of every plan connected with the construction of glass houses, and in heating them has proved every system devised during these last 26 years. In the cultivation of the Pine-apple, during his long career, Mr. Wilmot has been, upon the whole, eminently successful; and every mode propounded, from Speechly's to the Meudon plan, has been tried by him; the same may be said as regards the cultivation of the Grape. Every variety of soil, and all the various modes of constructing borders, have been amply proved under his supervision at Isleworth. It is scarcely possible for any one to have exhibited a greater degree of interest than Mr. Wilmot did in the introduction of new and improved varieties of fruits. During the period of which we speak, he made numerous excursions to the continent, in order to inspect the gardens of Belgium, Holland, France, and Germany; and on these occasions he made extensive purchases of varieties which appeared to him worthy of cultivation in this country. He was, however, often deceived, still this never damped his ardour. When Cayenne Pine-apples first became known to English gardeners, Mr. Wilmot was early in the field, and made large purchases, in order to test their value. His experienced eye, however, soon detected that instead of the smooth-leaved variety, the French were importing a large intermixture of the smooth-leaved Havannah, a comparatively worthless kind. Whatever he considered likely to suit the taste, and that would benefit the English public, that he procured, be the expense what it might; and so late even as last autumn, he planted a large breadth of the Jefferson Plum. Upon tasting that variety, he at once saw that it was an acquisition. In his relations with men interested in his professional pursuits, he at all times evinced the utmost frankness of manner, and explained everything without the least reserve. His mind soared above what are called garden secrets; consequently he imparted, especially to young gardeners, much valuable advice and information. Generous and kind-hearted, he was ever ready and willing to help the distressed; and everything he did was in a liberal and princely spirit. Naturally endowed with a vigorous mind, and great honesty of purpose, he was largely entrusted with the valuation of garden property. In short, he has left a blank in the community of horticulturists. *G.*

*Horticultural Meetings in the United States.*—The recent fairs, horticultural, agricultural and mechanical, have made a glorious era in the history of our State and City. The effects of such an in-gathering of the people, to witness the collected results of their own and neighbours' industry and genius, and the enlarged views produced upon the minds of all, may be imagined; but few will be able, even in their imaginations, to realise the effects of the exciting causes which have been brought to bear in this way upon the great mass. Time alone will show the result. It is like a great school to most men—being an occasion upon which new ideas or more liberal views are received—and the mind thereby improved, the heart expanded. A minute description of this fair would not be appropriate for a horticultural paper, but a few words in our own department may not be amiss, especially, since the merits of horticulture begin to be so highly appreciated by the agriculturists of our State, that horticultural societies are likely hereafter to have a representation in the body

of delegates who select the members of the State Board of Agriculture. The Floral Hall was a large tent, ornamented with evergreens, and decorated with greenhouse plants, floral designs, and displays of flowers—some of which were from the most distant parts of the State.—Mr. M'Intosh, one of the largest contributors of Roses, Phloxes, and Dahlias, &c., was from Cleveland—and he carried off some of the premiums too. The display of fruits was large, and occupied the tables around the entire circuit of the immense tent. The Apples, especially, were in great profusion, and from many distant points. Among them all, however, none were more admired than those of F. G. Carey, of this county, well known as the Principal of Farmer's College, and equally well known as the contributor of fine fruits at our Horticultural Hall. Grapes were very abundant, both those from open culture in the vineyards, and also from glass Vineries. John E Mottier was a liberal contributor of the former, having piles of Grapes on his tables; many visitors from this part of the State were astonished to see such fine well-ripened specimens, as those brought by Mr. Carpenter from Kelly's Island, in the extreme north, where it had been supposed the climate was too inhospitable for Vine culture. If Mr. Carpenter's experiments continue to succeed as well as they promise, this island will become an important region for fruit. A few years ago, when taking refuge under the lee of its forests, during a storm on Lake Erie, the passengers went ashore, and we were satisfied with a few black Raspberries—the only fruit product then to be found on the island. *Cincinnati Horticultural Review.*

*Gigantic Fossil Tree.*—Prof. Göppert has described a trunk, or rather the lower end of a trunk, of Pinites protolarix, discovered in 1849 in the brown coal of Laasan in Silesia. It was found in a nearly perpendicular position, and measured more than 32 feet in circumference. Sixteen vast roots ran out almost at right angles from the base of the trunk, of which about 4 feet stood up perfect in form, but stripped of bark. Unfortunately the interior of the stem was almost entirely filled with structureless brown coal, so that only two cross sections could be obtained from the outer parts, one 16 inches, the other 3 feet 6 inches broad. In the first section Prof. Göppert counted 700, in the second 1300 rings of wood, so that for the half-diameter of 5½ feet, at least 2200, but probably 2500 rings must have existed. Since there is no reason to believe that the rings were more frequently formed in earlier ages than the annual rings are now, this tree would appear to have been from 2200 to 2500 years old; a conclusion which acquires especial interest from the fact that this observation gives the first certain foundation for a chronology of the ancient world. *Botanical Gazette.* [We should be very sorry to build any theory upon such evidence as this, for reasons which English physiologists will understand.]

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

GENERAL PLANT HOUSE.—Eranthemums, Euphorbias Poinsettias, and many other woody plants which look unsightly after they have done flowering, may be cut down, and placed in any situation not too cold or damp, where they can be kept nearly dormant until spring. Gesneras, and similar habited plants, must be kept near the light, even after their flowers are over, otherwise they will be much weakened; and while their foliage continues green and healthy, give sufficient water to moisten the contents of the pot. Bring forward successions of the above winter flowering plants for supplying the drawing-room. The Phaius, Epiphyllum truncatum, and varieties, Francisceas, &c., will now be advancing towards a flowering state, and should be assisted by being placed as fully in the light as possible. The autumn-struck Gloxinias and some of the older bulbs which were dried off early last summer, will now be coming forward. A few Hyacinths should be put into a frame, heated slightly, at first. They delight in dung heat, and the finest blooms are always obtained in pits or frames heated with dung linings, and the plants plunged in leaves or tan. Cuttings of any useful winter flowering stove plants put in now, will be in a fine state for flowering next winter. Where space is limited, it is in many cases found necessary to do away with the old plants as they cease flowering; first taking a sufficient number of cuttings to secure a succession.

### FORCING DEPARTMENT.

Where extensive forcing is carried on, it is indispensable that a good stock of soil and leaves be provided, and laid up carefully in as dry a place as possible. Leaves, if collected when dry, and thatched over, will not ferment until required for use, and their heating property is thus economised. It is but seldom that shedding can be had for a large stock of these; but there are always some means at hand of keeping them dry, if only by covering them with Fern. A sufficient quantity of tan should also be laid into a shed; and thus, by having all things ready at hand, there will be the greater chance of success in the various operations carried on in the houses and pits, at this critical and busy season. PEACH-HOUSE.—In the early house, where the buds are now swelling, a temperature of about 50° by night, with a rise of from 5° to 10° by day, will be required, according to the clearness of the weather. Give air daily, and sprinkle the trees frequently during clear weather. STRAWBERRIES should now be taken into the forcing-pits once a fortnight. The pots should be plunged in leaves, and the plants kept about 1 foot from the glass, with a temperature of 45° to 50°, which will be sufficient top-heat for some time, after they are first brought into the pit. Give air at all times, except during very cold weather, and sprinkle slightly with the syringe, when bright days occur. MELONS.—Some seed of an early kind should now be sown.

### FLOWER GARDEN AND SHRUBBERIES.

Active preparations should now be made for propagating, by getting pits, frames, soil, and pots ready. In taking cuttings of bedding plants, it is worth while to bestow extra attention on the naming and distinguishing of the different kinds. It is very tantalising to find the harmonious arrangement of your colours destroyed for want of a little more care on the part of your propagator. When the weather permits, let any alterations in the ground which have been decided upon, be persevered in with all possible despatch, keeping always in mind that success depends upon the careful manner in which every operation is performed. These remarks more particularly apply to the formation of the ground, the preparation of the soil, and the taking up and replanting of choice shrubs. If not done already, cuttings should be put in immediately of many hardy shrubs, as the Jasmine, flowering Currant, Honeysuckle, &c. Look sharp after the beds of Crocus and other spring-flowering bulbs, as mice are very apt to attack them. We use the common figure 4 trap, baited with anything that mice are fond of, and find it answer the desired end.

### FLORISTS' FLOWERS.

The mildness of the season is telling on stocks of Polyanthuses and Auriculas; for during a tour we have made during the past week, we find that many have bloomed prematurely; amongst named varieties, this is to be regretted; with seedlings, amateurs are so anxious to ascertain the properties of their *elèves*, that it is rather desired, than otherwise; but no decisive step should be taken with them at this season, unless they are radically bad—in that case, they may be pulled up. In connection with these flowers, the necessary compost should be now attended to, the more simple the better; we are no advocates for sugar baker's scum, night-soil, &c., &c., which entered into the nostrum, of Emmerton, and others of his day. Well sweetened vegetable mould, with clean river sand, should enter largely into the compost; this, with loam taken from an old pasture field, well turned in frosty weather, to mellow, and free from insects and their larvæ, is the best to get together in quantity for these flowers of anything we know. If stimulants must be given, let it be done in the way of top dressings or liquid manure; but by all means, if the amateur wishes to escape cankered roots, with certain loss, let him grow his plants in the compost above alluded to.

### KITCHEN GARDEN.

CUCUMBERS.—If you have no other convenience for growing Cucumbers, materials should now be prepared for making up a bed for them. Let the litter be mixed with leaves, and the mass turned frequently, to allow the rank steam to pass off before the bed is finally made up. Those already advancing must be carefully attended to at this dull season. By a proper arrangement of the ventilators, a constant circulation of air should be secured, and where pipes or flues are used the portion of fresh air which is admitted from the outside, should, if possible, be made to pass over their warm surface before it comes in contact with the plants. Upon a proper attention to this point, the health of the foliage, and the setting of the fruit, very much depend. A high night temperature and a scalding evaporation is very injurious. ROOT-HOUSE.—Take advantage of wet weather to examine and remove any decayed or decaying roots, and adopt efficient measures for keeping out the frost.

### HARDY FRUIT GARDEN.

Short fruitful shoots of choice fruit trees for grafting should be secured, and laid in under a north wall. Long scions are not so good as those about 4 inches in length, which may be often found on a spur. In selecting these make choice only of those varieties which have been proved by experience to be well adapted to the locality. There are many varieties which do admirably in one county, but are worthless in another. In purchasing new kinds, the above reason makes it advisable not to procure too many plants of any one variety till its applicability to the soil and situation has been tested. By procuring root-pruned plants on Quince stocks, this may be easily managed in a couple of seasons. Planting of fruit trees should be proceeded with. It is well to be at some little pains in preparing the ground for the reception of Pears and other choice fruits. If the soil be deep and retentive, a stratum of ashes or some similar substance should be laid within 9 inches of the surface, to check the downward tendency of the roots. Loam from an old pasture, without manure, forms the best soil for the healthy and fruitful development of the Pear tree.

## Notices to Correspondents.

BIRDS: *L J W.* We regret to see that by an error of the printer the "widow bird" is called the Whydah, not the Whydah.

BOOKS: *R A.* Obtain the Catalogue of British Plants published by the Botanical Society. — *H.* Kaulfuss' "Enumeratio Filicum;" Hooker's "Genera and Species of Ferns" (very incomplete), published by Pamplin; Fresl, Tentamen Pteridographiæ, and the supplement. Fée Mémoires sur la Famille des Fougères.—*Juvenile Entomologist.* You will find the two little volumes of British Moths and Butterflies in Jardine's "Naturalist's Library," with coloured plates, sufficient at present. By-and-bye you will want Westwood and Humphrey's "British Butterflies and their Transformations," and "British Moths and their Transformations." *W.*

CARROTS: *G L H.* Then we should be greatly obliged if you would ask your friend to send it to Mr. Moore, of Glasnevin, with a request that he would have the kindness to report to us respecting it.

DAHLIAS: *Alpha.* The following will possibly suit you:—Princess Radziwill, Beeswing, Shylock, Berryer, Captain Warner, Toison d'Or, Marchioness of Cornwallis, Miss Vyse, Beauty of Hastings, Standard of Perfection, Yellow Standard, and Nonpareil.*

DISEASES: *W D H.* Unless your Odontoglot is suffering from damp and cold *combined*, we have no idea what ails it. You cannot have two better aquatics than Nymphæa cærulea and rubra. We should plant them in the mud of the tank.

FRUIT TREES.—Your situation being exposed to the south-west sea breezes, your better plan will be to make a thick plantation, so as to shelter as much as possible the fruit trees which you intend to plant, from the influence of those winds. The following kinds may be planted, with the recommendation to watch any that do not appear to grow kindly, and graft them with such as are seen to be the most thriving. Pears, in many instances, are known to succeed well near the sea, and of these you may plant the following varieties:—Marie Louise, Passe Colmar, Beurré Diel, Glout Morceau, Winter Nelis, Knight's Monarch, Althorp Crassane, Broom Park, Eyewood, Forelle, Thompson's, Ne plus Meuris, Easter Beurré, Beurré Rance. *Apples:*—Golden Reinette, Court of Wick, Wormsley Pippin, Kerry Pippin, Pearson's Plate, Cockle Pippin, King of the Pippins, Blenheim Pippin, Reinette du Canada, Scarlet Nonpareil, Boston Russet, Court-pendu Plat; and for kitchen use, Dumelow's Seedling, Alfriston, Bedfordshire Foundling, Mère de Ménage. *Plums:*—Green-gage, Purple-gage, Denyer's Victoria, Washington, Jefferson, Early Orleans, Coe's Golden Drop. *Cherries:*—May Duke, Elton, Downton, Knight's Early Black, Kentish, Bigarreau, Morello. For a wall with a south-eastern aspect, the following Apricots and Nectarines, as you prefer them to Peaches, will be suitable. *Apricots:*—Moorpark, Royal, Large Early, Turkey. *Nectarines:*—Elruge, Violette Hâtive, Balgowan, Stanwick. Your soil is of too dry a nature for the Quince Stock. ‖

INSECTS: *W S.* The insects in your hothouse are one of the small species of spring-tailed insects (Poduridæ). We do not consider them injurious to healthy plants. *W.*

LEAD: *Rev W M R.* Next week.

LEAF MOULD: *Sub.* The most effectual way of clearing it of wireworms is to soak it with boiling water.‡

NAMES OF FRUITS: *C B.* As far as we can judge from the figure, and the particulars which you state, your Pear is the Passe Colmar ‖

NAMES OF PLANTS: *M J.* Both Polystichum aculeatum. *S.*—*Erzeroum.* 95, Scrophularia vernalis; 34, S. laciniata?; 147, S. Scorodonia?; 125, S. lucida; 547, S. nodosa; 441, Solanum persicum.—*H T Thompson.* We see now that it is Magnolia pumila.—*J F.* 1, Blechnum Corcovadense, *Radd.*; 2, Pteris crenata, *Sw.*; 7, Adiantum pubescens, *Schk.*; 4, Cyrtomium falcatum, *Presl.*; 5, Notholæna lendigera, *J. Sm.*; 6, Adiantum cuneatum, *L. et F.*; 7, Platyloma rotundifolia, *J. Sm.*; 8, 9, Adiantum Capillus-veneris, *L.* (the tropical forms); 10, Asplenium flabellifolium, *Br.*; 11, A. compressum, *Sw.*; 12, Polystichum capense? *J. Sm.*; 13, Phymatodes scandens, *J. Sm.*; 14, Adiantum æsimile, *Sw.*; 15, Polypodium pectinatum; 16, 17, Sitolobum punctilobum, *J. Sm.*; 18, Blechnum australe, *L.*; 19, B. hastatum, *Kaulf.*; 20, Diplazium Shepherdi, *Presl. S.—E P.* We never name Mosses.

TIMBER: *C M S.* Saw-cut timber placed under a roof will become more quickly seasoned than if exposed to the weather without shelter. Your Pomegranate has not summer heat enough; a glass roof would give it more, and therefore should promote its flowering.

RANUNCULUSES: *Z.* The following are first-class sorts: Captivator, Talisman, Pleaser, Alexis, Paragon, Glenelg, Gem, Flaminius, Herald, Sir John de Græme, Creon, Aspirant, Dr. Channing, Queen, Mrs. Cowan, Exhibitor, Festus, and Coronation.*

ROSES: *S R H.* Fortune's yellow belongs to none of the classes you mention.‡

VENTILATION: *A Country Subscriber.* We have no experience with Louvre boarding; it may be a good plan. It is, however, of no use to provide for ingress of cold air below unless you provide for its *ample* egress above. The problem of ventilating hothouses well has never yet been solved. One great point is to take care that the air is warmed *upon entering* the house, and that there is plenty of it.

VINES: The Royal Muscadine will succeed against the back wall of a Vinery.‖

WOODWORK: *J W.* There is nothing better than Stockholm tar applied hot; if it does not dry fast enough you may melt with it a little pitch. Coal tar is also a good material, but its smell is against it. The dealers in these articles will supply you with tar brushes.

MISC: *M J.* Dielytra spectabilis is a hardy herbaceous plant. For the treatment of Fuchsia spectabilis, see p. 758 of our last vol.‡—*Torquay.* If your Apricots are standards, as we presume they are, they should receive no pruning beyond removing the dead wood. The best time for cutting back your Daphne, is just after it has done flowering. ‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, E-q., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

⁂ A second-hand span-roofed House for Sale very cheap.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

DO YOU BRUISE YOUR OATS?
No; then you lose 50 per cent.
A NICE STABLE MESS, effecting immense saving, and vastly improving the condition of the animal—bruised Oats, straw cut into chaff of a certain length, and a little hay; the whole steamed, and served up at discretion. No rack—down with the racks;—MARY WEDLAKE'S MACHINES, 118, Fenchurch-street, and 11, Tavistock-street, Covent-garden, where a machine may be seen at work. A pamphlet on the above, by sending 12 postage stamps.

**The Agricultural Gazette.**
*SATURDAY, JANUARY* 11, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

|---|---|---|
| WEDNESDAY, | Jan. | 15—Agricultural Society of England. |
| THURSDAY, | — | 16—Agricultural Imp. Society of Ireland. |
| WEDNESDAY, | — | 22—Agricultural Society of England. |
| THURSDAY, | — | 23—Agricultural Imp. Society of Ireland. |

THOROUGH DRAINAGE is to wet land what a good foundation is to a house. We can no more hope to exercise a profitable system of agriculture without the one, than to erect a firm and substantial building without the other. The parallel holds good even further; for as in the case of a badly-founded edifice, the more important and extensive the structure, the more imminent the danger, and the greater the destruction and loss likely to accrue. So, the more manure and labour we bestow on wet land, the greater will be the balance on the wrong side of the ledger at the year's end.

Drainage, then, being so valuable in its results, everything which tends to throw light on its theory or practice, or to promote its application, merits every encouragement which such a journal as this can give. In our present circumstances, called upon as we are to contend with the world in the production of food, we look to drainage as our sheet anchor. No country can vie with us in its application, and in none does it produce more beneficial results.

Much has been done during late years to illustrate the theory and guide the practice of this art. During the year which has just passed, its philosophy has been popularised and made attractive by the well-stored mind and pleasant periods of an able writer in the "Quarterly Review;" while its aims and ends, and its most improved practice, have been discussed in a more practical manner in the "Cyclopedia of Agriculture," by one of our own contributors, who has shown that we must have one system of drainage for the east side of the country, and another for the west; that the inch pipes, which serve to draw off 20 inches of rain annually, at Wakefield, will be quite overpowered with the 50 inches of the west coast, and that the fissures in the soil, which are formed even without draining during the summer months in a dry climate, will require the aid of drains *at narrow intervals* for their establishment under a humid sky.

While we have thus been extending our knowledge of the art, we have, at the same time, been giving it a widely-extended application. England, Scotland, Ireland, have each and all been measuring their drainage expenditure by millions, to the no small lessening of the cost of labouring the land, and increasing the quantity of its produce, whilst its quality has been greatly improved by its earlier maturity. Foremost among the promoting causes of these extensive operations stand the Drainage Acts, the two Public Loan Acts, and the Private Money Drainage Act. In consequence of the provisions of these acts, it has been put in the power of proprietors to drain their estates, no matter how embarrassed they may be, or how encumbered their properties; provided only the improvement to be effected can be shown to add to the rental value of the land such a sum as will cover the annual instalments at 6½ per cent., required to repay principal and interest in 22 years.

From what we already see of the effects of the extensive drainage works now being carried on, on various estates in different parts of the country, we augur the best possible effects from them, where they are judiciously executed, and that not only from their direct action upon the land, but from the powerful influence they must exercise upon agricultural practice around them. Where they are carried out in an enlightened spirit, and in a complete manner, they are causing the extirpation of numerous old and crooked hedgerows which interfere with the proper laying out of the drains. They are compelling the removal of numerous trees, which in some parts of the island quite overshadow and destroy the crops; for no competent inspector will sanction the placing of drains near Ash, Alder, or other water-loving trees, where they would in a year or two at most be rendered worse than useless by the roots. The old crooked watercourses, with their wide margins of weeds, are in course of being straightened and reduced to proper limits, or are fitted with large pipes and covered over, the effect of all which is, that in some cases the available surface actually receives an accession of one-fifth, while the expense of cultivation, rent, rates, taxes, and tithes, now commuted, remain the same. In some districts we observe large extents of waste land in course of reclamation by trenching and inclosing as well as draining, and in others, lands covered with brushwood and stumps of old trees made highly productive by trenching and draining.

We must here notice, in order to give our hearty commendation to it, an arrangement which has been come to on several large properties, by which the landlord undertakes the whole of the drainage, and himself pays either the whole or the greater part of the annual instalment on the outlay, deeming this the best way to enable his tenantry to meet the times. We shall be greatly surprised if, in the course of a few years, both landlord and tenant do not find themselves in a better position under such an arrangement, than where the latter are left to do the best they can with wet land and a reduction of a few shillings an acre of rent.

The carrying out of the provisions of the Drainage Acts in Great Britain has been entrusted to the Inclosure Commissioners of England and Wales. The mode of obtaining advances under them is of the most simple and comparatively inexpensive description consistent with a check upon the proper expenditure of the money.

We are induced to draw special attention to this part of our subject in consequence of a letter from "An Assistant Commissioner under the Acts," which appeared lately in our columns, and which has evidently been written under most erroneous impressions, and contains insinuations against the Inclosure Commissioners which are, as we feel confident, entirely unfounded, and which were contradicted in our last number by a communication authenticated by the signature of Mr. GIRDWOOD. We the more regret the appearance of this letter, as the signature would necessarily give weight to the observations; for the conclusion would be natural that an "Assistant Commissioner" must know the technicalities of proceedings under the acts, and have assured himself of the correctness of his position before he attacked his official superiors.

We have taken steps to ascertain the facts of the case alluded to, and we find it to be nearly, if not altogether, a singular one. It appears to have occurred at an early period after the passing of the first Drainage Act (1846), before inspectors had been appointed in each district of country, and when the charges of surveyors and engineers had been raised to an extravagant height by the railway mania. The high rate of expense seems to have been wholly occasioned by the exorbitant bill of the gentleman who made the preliminary inspection. We understand that the commissioners took steps to prevent a like occurrence in future; and the effect of these steps is sufficiently illustrated by the fact, that the inspection on completion, although necessarily the most troublesome piece of work of the two, did not cost above one-third of the sum paid for the preliminary inspection. We find that there were no office expenses *whatever* in the account, and the only charge, besides those for inspection, was a small sum for advertising in the *London Gazette*, and local paper. It also appears, that if the same gentleman who made the second inspection had made the first, the whole charge would not have exceeded 18*l.*

We have gone into this subject at some length, as we are anxious to correct the erroneous impression which we may have been, in some degree, the unwitting means of propagating; and we are also anxious to point out to those of our readers who may have occasion to drain their lands, the great advantages which the provisions of these acts afford. The expenses where the sum applied for approaches 1000*l.* will seldom exceed two or two and-a-half per cent.; while every one knows that the law charges on a mortgage of similar amount, where such can be made at all, are seldom under 5 per cent.; besides the trouble and discomfort of producing title-deeds, not to speak of the impossibility of making fresh charges on settled estates—a difficulty which the Drainage Acts were expressly framed to meet. The expenses too, such as they are, must not be looked at as merely incurred in guaranteeing the Commissioners as to the expenditure of the money; for they secure the advice of some of the most skilful draining engineers in the kingdom. Where large sums have been applied for, as 10,000*l.* or 12,000*l.*, the charges, in many cases, have not exceeded 1½ per cent.

In conclusion, we heartily bear testimony to the assiduity and care with which the Inclosure Office has watched over the preparation and administration of these acts, which have been a great boon to the agricultural community; and we have abundant means of knowing that no effort has been spared to reduce the expenses to the lowest possible limit. "J. T." seems, unfortunately for himself, to have suffered from the want of completeness of arrangements, which is always apt to be the case in the first working of new and untried measures, more especially during such periods of alarm and suffering as those which characterised the period of the passing of the first Drainage Act. We know that it is now the practice of the Commissioners, and a practice occasioned by the very case which has been brought forward, to scrutinise all bills most rigourously, and to cut them down where necessary. In point of fact the Commissioners have struck large sums off several bills, and have ceased to allow the gentlemen to act who made them. Those, therefore, who now take advantage of the acts will receive all those benefits, which "J. T." admits that they offer, without those drawbacks from which he unfortunately suffered.

---

THE new year opens gloomily upon the agriculturist. In spite of open predictions of amendment, amongst the hopeful, and in spite of the not less sanguine though secret hopes against their own auguries, amongst the timid, prices continue low, and the corn-grower sits apart, the sole unpartaker in the feast that he has helped to make for others. Meantime the nation is busy and prosperous; trade is active, capital increasing, money abundant, wages good—so at least the usual organs of the world that lies beyond the farm inform us; but the news comes sadly and unmeaning to the ears of that one interest whose share seems but a scant one in the merry Christmas, and which looks ahead with but a hazy prospect of the "happy new year" that is passed, much as usual, from mouth to mouth around. Even to the most habituated preacher of despondency the prospect seems to offer the puzzle of a reality that he never meant exactly to come true; for people differ more in their avowed prognostications than in their actual beliefs, and commonly blame the hopeful seer more for his manners than his appetite in which they entertain a common sympathy. Even the wisest confess themselves puzzled: and not in this country alone, but in more than half the countries of Europe the same complaint, strange-sounding to the ears of the "consuming" world, prevails, and for the last two or three years has prevailed, of a low price and plethora of food.

Were agriculture, like most other business pursuits in this country, a struggle of capital against capital, instead of a continual struggle against the want of it in the immense majority of instances, the whole matter would bear a different aspect. A few years—a cycle as it is—of abundance and consequent cheapness, would come upon the producing interest it affected, bringing neither surprise, despondency, nor resourcelessness; profits might be lowered, seemingly annihilated, for the time, as they have been in the cotton, the silk, the woollen, the iron, and most other of our principal trades, within our not unfrequent remembrance. Hard-pressed industry, and hard-earned capital sunk apparently for the moment, like a labouring vessel in the trough-of-the-sea during a ground-swell, would yet gradually rise again, steady and still buoyant, chastened to a knowledge of the ways, but not unmindful of the mercies of Providence. But in the agricultural world the cumbersome inventions of human ingenuity and one-eyed selfishness having for half a century shut out all real trade experience, all extended and commercial knowledge, all the external and powerful influences that, operating with healthy and unrestricted freedom upon the other arts and industries of our advancing community, have built up out of the progressive intelligence of each pursuit its own best insurance against occasional periods of depression—have left

this one, the greatest of all, unprepared uncovered to the storm, the tender plant of a fostering legislation—and as is ever usual in such cases, the deserted victim in the end of the guardian genius it so long invoked succcessfully, and unwisely.

It may indeed be easy to many who never saw this before to see this now, from the vantage-ground of after knowledge; but it is not so easy to trace and point out in all their ramifications, the inward weakness, the ignorance, the errors, the improvidences, the neglects, the unprepared positions, and the false calculations that have rooted themselves with ease, and spread their consequence throughout the whole business of agriculture, and of that raw material that agriculture is concerned upon—the land. The whole subject, long protected by false expedients, from an honest scrutiny, is found in a state of dislocation, and wants overhauling: high prices, high rents, cloaking ignored duties, neglected improvements, *unstimulated invention*, and stupid laws, have worked together in mischievous alliance, in nothing so mischievous as in mutually keeping possible each others' existence. Error is fruitful of collateral incidents: like the first lie, it begets a legion to support it. Where there is one radical fault, it spreads like a leaven through the whole mass; it is vain to go on cobbling at details; you must go back to the origin of the evil, if you wish to cure or even to understand it.

He would be like to earn for himself the title of a powerful assertor of undisputed propositions who should bravely venture to declare that at the bottom of all agricultural processes lies that rawest of raw materials—the Soil. And yet strange enough it is that what sounds so broad and obvious a physical truth in the ears of the farmer, seems to struggle in vain for a recognition in that of the landowners. In vain do the Crown-lawyers in Parliament, who are best able to know the truth, and can afford to speak it, again and again, session after session, invite the landed legislators around them to turn their individual attention and collective weight to the amendment of the laws relating to, and the practices,—worse than any laws, that tyrannise over the land. Ask any tenant occupier in any county of England, with a lease or without one, what is the one thing needful to help him to rub through a period of agricultural depression—what it is that will keep out the fiend of despondency, cheer his hopes, stimulate his enterprise, and turn adversity itself to its best lesson and purpose; he will tell you, the help and countenance of an intelligent and spirited landlord. Put the converse question—ask him what is the most deadening and destructive thing to a farm or a property—that makes improvement an impossibility, kills energy, turns backward that which should be progress, and makes, even "standing as you were," impossible; the answer will be sadly, and per-contra-wise to the same effect. It is a trite and easy matter to calculate the number of pounds sterling to the acre that the tenant in agriculture should be master of to hold a farm; but what would be the blank looks if the same principle of calculation were propounded to the *tenants in tail* to hold an estate. Of all the greedy swallowers and potent "assimilators" of capital where is there one like land, to be the owner of? Of all the low-interest-paying investments of capital where is there one like land, *to buy?* Of all the borrowers on first-rate security who borrows at so great expense, to pay so high an interest, as the borrower on land? Of all the helpless creatures in creation, tied to a possession that he cannot part with or improve, or enable others to do it for him, who so helpless as the tenant for life in tail? The State at length recognizes the public impolicy and private cruelty of his predicament, and lends him money to drain his land; in other words it supplies to him the means of making the first plunge into an indefinite investment. It opens out to him a new and bolder relation with the soil he is the owner of. He becomes a pseudo-capitalist for the nonce. The money is borrowed and expended, the land is drained, and a Turnip-crop springs up upon the four-course odd mark of his farms, where the summer fallow used to be. Turnips imply stock to consume them; and stock imply buildings to cover them. The difficulty is at his door again, with a louder knock than before. Tiles and collars and four foot drains are expensive, but what are they to Bricks and Mortar! So the State takes off the duty on Bricks, and talks of playing the money-lender again, in new loans for agricultural buildings.

And why all this? To support a false position: virtually and in effect to keep land out of commerce: to make free-trade in corn amalgamate with feudalism in the soil: to keep ostensible owners in the ostensible proprietorship of ostensible acres, which there is plenty of private capital in the country to buy and improve, and *realise*, without recourse to loans from the public, and leaving the present owners so much the better able, by being rid of a part to perform their duty and their wishes by the rest.

If it be an evil for the occupier to hold more land than he has capital to manage, how is it a good for the owner? If it be a benefit to the country that money should circulate, how is it a benefit that land should stagnate? To reduce the proposition to its plainest terms, how can free-trade in corn ever permanently exist without free-trade in the land that grows it? For what is land to corn but the raw material to the manufactured article?

The land is, in two distinct and separate ways, tied up out of commerce. First by entails and family settlements, secondly by the shameful and absurd expense of transfer, an expense proportionately greater, not directly, but inversely with the extent of the purchase; thus confining the sale, in effect, to large purchasers, thereby reducing the market to its narrowest capacity, and consequently reducing the price; for where purchasers are few, it needs no LOCKE or ADAM SMITH to tell us, the exchangeable value is reduced proportionately.

But what shall we say of those not uncommon cases where the occupier himself would readily and gladly be the purchaser, and could well afford to be so, and the proprietor would readily and gladly be the seller, and would be the richer, and his successors after him, by being so, of land upon which the one cannot afford, nor the other prudently expend even the capital requisite for its improvement? Upon what principle of public policy, or of private benefit, can the system be defended of withdrawing land from the reach of capital, and the twice-blest employment of labour, blest in the operation and in the result, in order to gratify a vanity of extensive but empty ownership, the likeness of which, amongst occupiers, men are now loud in condemning, as a source of the most self-deceptive injury and public loss.

We took occasion to notice, some time since, a pamphlet, addressed to the CHANCELLOR of the EXCHEQUER by Mr. CALVERT, Q.C., upon certain laws affecting agriculture, in which the effect upon the condition of landed property arising from the position of Tenants for life was most ably scrutinised, and the proper remedies suggested. We have now to express our cordial welcome of a second letter from the same pen in continuation of the subject.* If a very small share of the intelligence with which Mr. CALVERT has popularised the really momentous features of this question, were generally diffused amongst both the owners and occupiers of land, we may safely say that a more valuable new year's offering could hardly be made to them. To quote from it is almost impossible: the subject itself is so succinct, from its very nature, as well as from its terse and simple treatment in his hands, so appropriate and opportune in its suggestions, that we shrink from the mutilation of his views and arguments by detached extract; and would rather entreat for the ten minutes its entire perusal would cost, with all who feel an interest in the question,—never perhaps so vital as at this moment,—What can be done for British Agriculture?

To state the objects of this important letter, without the writer's arguments, is merely to open a naked case to the possible damage of misunderstanding and pre-conceived error of every kind. It goes to what Mr. COBDEN would call 'the backbone' of the subject. Since the publication of the first letter, time has given proof of the necessity of the measures then proposed, and the partial acts of the Legislature in the direction pointed out, have confirmed it. Probably the most important by far of the suggestions in his first letter was the one to the effect "that Tenants for life should be empowered, *under proper safeguards*, to sell so much of the Settled Estates, as would be sufficient for the discharge of the Settlement-incumbrances;" in other words, to discharge the inheritance from a settled debt, to

> "Throw away the falser part of it,
> And live the truer with the other half."

"Why," asks Mr. CALVERT, referring to the recent Act, 13 and 14 Vic., c. 31, "is not the English landowner, who desires to make improvements, to be released to the same extent as the Irish landowner, from the trammels of the settlement? Are not landowners in both countries suffering from imprudent settlements, made, not by themselves, but by their ancestors or predecessors *in the days of high prices?* Are they not in both countries equally compelled to encounter the competition of other soils and climates?"

In these two last propositions lies the gist of the whole subject. 'Lower your rents, or enable your tenants to pay the same rents out of lower prices,' cry the tenant-farmers and the public—'drain your fields, improve your roads and fences, put up ample accommodation for an increased head of Stock, and for the housing and economical conversion of an increased produce.' Now let us look at the position inherited by a very large proportion of those to whom this natural and reasonable demand is addressed. Mr. CALVERT has well described it, as it commonly arises.

"No sooner does the tenant in tail come of age, than he is urged by those *whose influence is irresistible*, to cut off the entail, to resettle the estate, and to fasten upon it the debts of his ancestors. In fact, he is invited to pay for the extravagance of a father or grandfather, who has often done worse than nothing for the condition of the family property. Thus the burthens of the generation which is passing, or passed away, are heaped upon that which is advancing. It may be fairly made a question whether the law ought not to be modified in this respect; whether so young a person should be by law capable of binding himself in so important a transaction. It is open to two serious objections; one, that a young man executes a solemn act deeply compromising his fortune, when as yet he cannot understand its consequences; the other, that the weight of hereditary debts which he thus fixes upon himself, crushes all his efforts and disappoints all his intentions to improve the cultivation of his estate. This system sacrifices the interest of the entire present generation, not merely of the tenants for life, but also of *their tenants and labourers;* while the principle upon which it cherishes the prospects of generations unborn, are, to say the least, extremely doubtful. I am convinced that the interests of the remainder-man or descendant will be much promoted by the removal of this peculiar restriction which is now part and parcel of the law of settlements. The agricultural improvement of a district effected in one generation is eminently useful in the next. Indeed a further question arises whether the entire system of settlement will not be summarily destroyed, if it continues to interfere with the due cultivation of the soil, and with the provision of employment to the labouring classes."

Mr. CALVERT has taken up a subject which he thoroughly understands; considering it, as it must be considered, both from the legal and the agricultural point of view. Every word he writes proves it. The landlord, the tenant, and the labourer are equally concerned in this question: this he clearly sees; and we confidently trust that in the House of Commons he will prosecute it, and make it understood as it deserves to be. It is almost monstrous to suppose that with so large a portion of the proprietary interest in the land tied up as it were from free action in the employment of capital, or in the power to enable others to employ it, a fair scope can be offered to those who have to meet a free competition against the world. The existing system of settlements was based upon high prices. These have passed away; and the country is satisfied, and commercially prosperous under the change; but before the benefits which other classes enjoy can reach the agricultural interest, though we are scarcely doubtful of the result, yet much remains to be done. The system of Government, or to speak more plainly, of public loans, has worked well, but the very success of a temporising and not very constitutional expedient, may after all be only an index pointing in the direction of a truer remedy. There is good reason to believe that, in both Houses of Parliament, the approaching Session will shew that the subject is becoming better understood and its importance appreciated. It is only strange that the simplification of the dealings with land should be a point remaining for discussion, after free trade in the produce of it has been for two years predominant. We shall watch the subject with anxious interest, and the more so as we believe it to be one the bearing and influence of which is not half recognised as it ought to be, towards the agricultural prosperity of the kingdom.

* Second letter to the Right Hon Sir C. WOOD, Bart., M.P., upon certain laws affecting Agriculture. By FREDERIC CALVERT, Esq., Q.C.

## HOME COLONISATION.

WHATEVER may be the cause of the present low prices of agricultural produce, we have little doubt that the pressure which it produces on landlords and tenants will prove, like the Potato failure to those of Ireland, eventually beneficial to them as a class, though the benefit will be attained through much individual suffering. Among the most hopeful signs must be enumerated the attention bestowed on agricultural questions by the writers of the daily London newspapers, and their sound and practical mode of treating them, compared with that which prevailed during former periods of agricultural distress. Time was, in 1822 and 1835, when all the evils which afflicted farmers, and all the necessity for the increased protection which they so frequently demanded, were attributed to their propensity for cultivating inferior soils; and the remedy proposed was to suffer some millions of acres of such soils to revert to the state of

heath and sheep-walk from which, it was said, they ought never to have emerged.

Now, the metropolitan journals labour sedulously and effectively in diffusing a knowledge of the best systems of cultivation pursued on such soils, and in proclaiming the grand fact, proved by innumerable examples, that the improvement of poor land affords a more profitable investment for capital than the purchase of the best. Time was when those who complained of the low price of Wheat were advised to grow Pine-apples; and when it was proved by all the rules of political economy to be both the interest and the duty of the owners and occupiers of the soil to make fish, poultry, and game as abundant and cheap as beef and mutton. Now, three hares are proved to consume as much as one sheep, and the batteries of the daily press are very laudably turned against the preserves and battues to which we are indebted for the present cheapness of game. By means of these, they who possess good local information as to when and where certain lords and squires have been shooting, and who keep a vigilant eye on Leadenhall-market, are frequently enabled to sit down to hare or pheasant at a cheaper rate than if the noble and gentle sportsmen had made them a present of it, but had not paid the carriage.

What, if an occasional "leader" betrays a hankering after some little table luxuries, and gives vent to dissatisfaction at their cost, in exhortation to farmers to grow less corn and butcher's meat, and to direct their attention to fruit and vegetables, unmindful of the fact that market gardeners complain as loudly as farmers of foreign competition and low prices, and assert that they supply the cockney dinner tables with Peas and Asparagus, Apples, Cherries, and Peaches, not only without profit but out of their capital. These little editorial outbursts are very excusable. Parliament is not sitting, topics are scarce—space has to be filled—and the great "We" may have been annoyed by a heavy bill from the green-grocer, after having, on the faith of low prices, given a spread of more than usual hospitality.

On the whole we cannot be too grateful to the daily press of London for their exertions in the cause of agricultural improvement. About this time last year the great topic was the investigations of the *Morning Chronicle* respecting labour and the poor. In them we saw the tact and acumen of the practised reporter, making old blue books readable, and sifting their Wheat from the chaff. Penetrating personally into the abodes of poverty and vice, he made them tell their own tale in that form of monologue or dialogue which gives so much zest to novels of the "Oliver Twist" and "Dick Turpin" school. Nor let it be objected that, like those novels, these investigations only produced a few sentimental tears, an undefined dread of our dangerous classes—a virtuous indignation against the "sweating system," or a transient burst of feeling, which quickly blazed itself out, in subscriptions for the hero or heroine of some tale of woe. The Association for Promoting Female Emigration, the first fruit of those labours, is a promising plant, which bids fair to develope itself into that which so many desire, and of which few have any definite perception—a "well digested system of national colonisation." As far as experience has yet gone, the experiment has been successful; and, being an experiment, it is a merit rather than a defect that it has been undertaken with caution, and, at present, only on a small scale.

Amidst much that is valuable in the reports of the agricultural commissioners of the *Times*, we select for notice some facts which strongly illustrate a point to which we have ourselves endeavoured to draw attention—the unequal rate of agricultural wages in different districts of England. That journal lately announced that great dissatisfaction prevailed among the agricultural labourers of Buckinghamshire, in consequence of the attempts of the farmers to reduce wages to 7*s.* a week. Since then the *Times* commissioner has stated that in South Lancashire the farmers are giving from 12*s.* to 15*s.* a week to English labourers, and 9*s.* to Irish; cottage rents being from 3*l.* to 5*l.* a year, and fuel cheap. Women, it appears, are rarely employed in field labour, because they can earn better pay in-doors in the factories. Under these circumstances we are told that the manual labour of the Turnip crop is nearly double its cost in the south, and the farmers declare that they could not get on at all without the Irish. Such being the case, we should suppose that a supply of the Buckinghamshire labourers would be a great acquisition to the farmers; and that to these seven-shillings-a-week men, South Lancashire would be a paradise. In looking to emigration as one of the means for improving the condition of the labouring classes, let us not wholly overlook home colonisation. Emigration need not be *per saltum*. The steps might be from 7*s.* in Buckinghamshire to 15*s.* in South Lancashire, without board, and from that to the same money wages, with board, in Canada or Australia; together with the certainty, with good conduct, of becoming a landowner and an employer of labour. It would be an object well worthy the attention of the benevolent to organise a system for the transfer of the redundant labour of the purely agricultural districts, to those where the presence of manufactures has improved the condition of the labourer in husbandry by extending the demand for his services while it has diminished the supply. We hope to see the influence of the fourth estate directed to the furtherance of so practical and desirable an object. *E. W.*

## TITHE COMMUTATION.

As your agricultural as well as clerical readers may feel anxious to know the result of the Corn Averages for the seven years to Christmas last, published in the *London Gazette* of last evening, viz.:

| | | |
|---|---|---|
| Wheat | ... ... | 6*s.* 5½*d.* per imperial bushel. |
| Barley | ... ... | 4 0 do. |
| Oats | ... ... | 2 8 do. |

I beg to state for their information that each 100*l.* of rent charge will for the year 1851 amount to 96*l.* 11*s.* 4¾*d.*, or about 2¼ per cent. lower than last year. The following statement from my "Annual Tithe Commutation Tables" will show the worth of 100*l.* of rent charge for each of the following years:

| | £ | *s.* | *d.* |
|---|---|---|---|
| 1845 ... ... | 103 | 17 | 11¼ |
| 1846 ... ... | 102 | 17 | 8¾ |
| 1847 ... ... | 99 | 18 | 10½ |
| 1848 ... ... | 102 | 1 | 0 |
| 1849 ... ... | 100 | 3 | 7¾ |
| 1850 ... ... | 98 | 16 | 10 |
| 1851 ... ... | 96 | 11 | 4¾ |

If we include the whole period of 15 years elapsed since the passing of the Tithe Commutation Act, it will be found that the general average value of 100*l.* of tithe, rent charge amounts to 100*l.* 16*s.* 7*d.* *Charles M. Willich* 25, *Suffolk-street, Pall-mall, Jan.* 4, 1851.

## Home Correspondence.

*The Drainage Act.*—"J. T's, Swansea," complaint of the charges of the Drainage Commissioners appears to me to be unreasonable, and to require only the following explanation to be seen in a very different light from that in which he would place it. It will be easy to show, although he has paid 34*l.* 5*s.* 10*d.* for the loan of 400*l.*, that he could have raised the money in no other way so cheaply; and he has gained, in addition, the assistance of an inspection, which, if he had had the experience of others of the waste of money, from the want of such an inspection, he would not think it too highly charged for, at the rate of 5*s.* or 6*s.* an acre. Let me advise "J. T.," and all your agricultural readers who have land to drain, and are willing to leave the plan, &c., to farm-tenants and bailiffs, first to read "Agricultural Drainage," published by John Murray, Albemarle-street, price 4*d.* The Government advance is made at a rate of interest of one per cent. per annum below the common rate of advances on mortgage; and the borrower gets the further advantage of paying back the principal in annual instalments; now, if "J. T." will refer to "Inwood's Tables," fourth table, he will find that the difference of borrowing 400*l.* for 22 years, at the rate of 3 per cent. and 4 per cent. per annum, amounts to 38*l.* 12*s.* 9*d.*; and had he borrowed the money in any other way, he would have had, in addition, to submit to investigations of title, &c., and been fortunate, had the lawyer's charges, which he would have had to pay in addition, been so little as 34*l.* 5*s.* 10*d.* In all advances under the commissioners, not only do the borrowers get their advances on lower rates of interest, and save the ordinary cost of investigations of title, &c., but they also have the advantage of an inspection of the proposed works by experienced surveyors, which secures the landowner from improvident outlay, both as to scale of charges and planning of the work. There are some of your readers who, of my knowledge, will not so lightly estimate the value of this inspection. I could name many individuals who, upon the advice of the Government inspectors, have seen reason to abandon the plans on which they had proposed to expend many thousands, and to adopt those of the inspector; but I will not enlarge on this, as I trust the work I recommend will be read by every one who has draining to do, and who may be in doubt of the value of some such an inspection as is given by the Drainage Act. I have only to add, and I would do so as a postscript, and rather with reference to the present working of this Act, than as any apology for the charge of which "J. T." complains—that in 1846 when his application was made, the commissioners were ill prepared with inspectors; they had to send great distances; and further, that the costs are necessarily large on small advances, and in this instance, would probably have been no more had the sum been 1000*l.*, in lieu of 400*l.* *Hewitt Davis.*

*Report of Smithfield Show.*—My late friend, the Rev. Henry Berry, during our long connection, never having bred Hereford cattle, I beg to correct your statement of him in your report of the Smithfield Show, page 795, describing Class I. "2d prize was a Hereford ox of much merit; the length of the body exceeded the proportion of the girth, and the shoulder was not well covered. The fore ribs were uncommonly fleshy and the thighs deep. The back and the set of the tail formed a continuous level, and the whole animal was one of the best that were shown. It showed the value of the stock of the Rev. Henry Berry." The latter part of the above, I take it, was your criticism on the second prize in Class N., Mr. Boult's 3 years old steer. "The length of the body exceeded the proportion of the girth"—I cannot understand, comparing, in your first table, oxen 4 to 5 years old; 2d prize Hereford, 5 ft. 6 in. length, 8 ft. 6 in. girth; Smithfield oxen, 2 to 3 years old, 2d prize, 5 ft. 9 in. length, 8 ft. 9 in. girth; oxen, any age, under 90 stone (short-horns Smithfield), 2d, 5 ft. length, 8 ft. 4 in. girth." I take No. 1, in the quotation, to be Mr. Philips' ox, weighing 97 stone, and No. 2 to be Mr. Boult's, weighing 105 stone; or No. 4, weighing 83 stone. I do not anywhere see stated the length of the body exceeding the proportion of the girth. *Henry Cottrell, Rhodyate Lodge, Congresbury.* [The remark about the length and girth meant that that particular ox was very long in proportion to its girth.]

*The Proposal to Increase the Size of Smithfield Market*, instead of removing it altogether, is rather amusing. At the present day can a company be permitted to retain a public nuisance, in the midst of a population consisting of two millions of human beings, almost all of whom are anxious to get rid of the abomination? Those persons who own property in the vicinity of Smithfield market may fancy themselves aggrieved by the metropolis being freed from scenes of cruelty and vice unparalleled in any other Christian country, or even in the regions where the heathen dwells, who although not blessed with a knowledge of the true faith, yet is more merciful to the brute creation than those who are taught better, and who have not the excuse of ignorance to palliate wickedness. The sufferings of sheep, oxen, and pigs, goaded to Smithfield market, are terrible; and their miseries are not altogether unrevenged, as their overheated and inflammatory bodies, sold in the shambles, produce a variety of diseases, amongst which bowel complaints are the most prevalent, followed by typhus fever, &c. It is in vain we shut our eyes to these startling facts; and we must not attribute illness at particular seasons so much to atmospheric changes as to the body being, from the indulgences in impure food, more susceptible of injury than it would be if partaking of a wholesome diet. Individual interests cannot be considered when the welfare of thousands is concerned. If such is to be the case in the instance of Smithfield market, great injustice has been done to many thousands whose pockets have suffered to benefit "the million." A locality now exists in London condemned by the great mass of the inhabitants, as injurious to health and morality; and surely a sink of everything that is bad should be cleansed in the 19th century before we expose ourselves to the eyes of the whole world during the influx of people of all nations during 1851. It is strange that health reports do not lay more stress upon impure food consumed by man as causing disease! *Falcon.*

*Farm Accounts.*—As your correspondent, "E. F.," wishes to know what alterations I propose to make, I have inclosed an arrangement of columns, which shows at one view the present arrangement adopted in the Royal Ag. Soc.'s Labour Account-book; and the alterations which I propose to make, should there be anything in my plan which is not understood, I shall of course be happy to forward an explanation. With regard to the general arrangement of the book, I think the stock, corn, and cash accounts might be removed from its present position to a page now devoted to "hiring and wages of servants;" this is an account which I think will be seldom or ever used, as in most places labourers are paid weekly, and turned off at a few days' notice. By removing this account, it will be seen that something like 4½ inches of length might be safely done away with, and the whole remaining portion of the page devoted to weekly labour accounts. The present length of the Royal Ag. Soc.'s Labour Account-book is decidedly inconvenient. *J. R. Markby.* [The arrangement of columns for Labour Accounts in the Royal Ag. Soc. of England's Account-book is altered:—1st, by reducing width of column for names; 2d, by taking out column for "signature of labourer," which is useless, and putting in its place a column for "description of task-work;" 3, by putting the columns for "days—at per day—and weekly wages" after all the others; and 4, by putting a double line to each name in the name column. The whole effect is to reduce the width of the page 2½ inches. This description of the alteration may suffice, as the specimen page would be too bulky.]

*Poultry Houses and Poultry Walks.*—In reply to your correspondent "W. H." (see *Agricultural Gazette*, Dec. 21), who wishes to know the dimensions of my poultry houses, and the extent of my poultry walks, I here subjoin the required particulars. The largest of my poultry houses is 9 feet square. It is built of brick (with a tiled roof), excepting the front, which is of wood, and protected by Stockholm tar, with which it is thickly covered. On one side of it is a recess 10 feet deep and 3 feet wide, with a slated roof for the fowls to take shelter in during heavy rains and unseasonable weather. The extent of walk is 20 feet by 15 feet; the top is considerably elevated, in order to afford the fowls an opportunity of perching high. The perches are fixed in a variety of directions, and so placed as to command an extensive view of the neighbouring gardens, Ravenscourt Park, &c.; and, of course, a glimpse of the sun's rays. By the fowls being constantly seen seated on these perches, it is quite evident that they are "happy" in their confinement; and being always in robust health, and the nests for the most part abundantly supplied with eggs at all seasons of the year, I am led to believe that my treatment of them is in every respect correct. No poultry-house ought to be of less dimensions than from 6 to 7 feet square (I have several this size); and if built of brick, so much the better. It is warmer than those built of any other material. The larger the poultry walk the better; 12 feet by 9 feet should be the minimum size. By turning the top soil frequently over, the walks will be kept sweet and wholesome, and the health of the poultry thereby ensured. Since my last communication appeared, an increased number of my hens have come into lay. In a few days, I expect they will all be "profitable servants." *William Kidd, New-road, Hammersmith, Dec* 24.

*Agricultural Education.*—As it is evident that some exertion must be made by all classes in acquiring a better knowledge of the sciences that are more immediately connected with the various occupations with

which we may be connected, I would venture to suggest botany as one department which might be made not only useful, but also interesting, to those engaged in rural pursuits. Hitherto it has been confined almost exclusively to professional gardeners. But why should it not be rendered useful and also pleasant to those engaged in farming? I think it may be more attractive to them; for they are brought more in contact with the spontaneous productions of Nature than any other class. And when we consider how the different orders of plants prove the nature, climate, and capabilities of soil, is it not very evident that botany would be useful to the farmer? I am quite aware that there are few practical farmers that will think the finer theories of that science of any use to them, and perhaps they are right; but I much question if, once they had obtained a slight knowledge of its outlines, they would rest contented to let that little remain inactive. But it is more particularly to the rising generation that this delightful science might be made available. Suppose that, in taking a walk across the fields, we were to take a little notice of the wild plants, we would find that one sort prevails in one place, which was not to be found at another. Then we might be led to ask why that was? We find in one field a certain weed prevailing, which we do not find in another; and these will indicate the strength, coldness, or deepness of soils; and also the nature of the subsoil to a great extent. And this might be a guide to many respecting land that they are otherwise unacquainted with. At times a farmer may have his children with him when in the fields, and it would be of little interest to them to try to instruct them in the dry details of field operations; but he might instil into the tender mind a pleasure in the wild wayside plants, and thus turning the mind to a love of the beautiful works of Nature more immediately connected with that calling which he is destined to follow, instead of leaving the young mind vacant, to be filled up with the many evil weeds which may and will take root, unless care is taken to sow the good seed of useful and pleasing instruction. The spare time of old and young might thus be very pleasantly employed during the summer. And such an occupation would never lose its attractions. And in our journey through life, which is said to be beset with thorns and briars, we should find a good many flowers mingled, to cheer our path. But then there is a season of the year when what may be called practical botany cannot be studied, and when the youthful mind may be led to imbibe evil and careless principles. And how is it to be got over? Those long dreary winter nights that many spend drinking a pint or smoking a pipe, to pass the time away, until at last they fall asleep in a state of stupor; while the young are apt to run into company who, like themselves, have nothing to do, and, of course, will soon acquire habits of doing worse than nothing. But to prevent this state of languor and dulness there is a science equally interesting and useful with the former, and now generally admitted to be indispensable to the farmer, that may be turned to; that is chemistry. And were this science not so directly useful to the farmer as it is, would it not be extremely pleasant on its own account, as explaining the laws which govern the many peculiarities of nature that we see around us. How many small but interesting experiments may be performed by one who is not very well acquainted with the higher departments of that science! And if the smallest beginning were made it would give a stimulus to further exertion. And with the numerous aids that may be cheaply obtained by books, a greater degree of knowledge may be obtained than the uninitiated could ever dream of. And then how different would be our feelings in our daily walk, in viewing the various objects around us! Everything would then possess a beauty, order, and simplicity which would elevate our ideas, and excite our pleasures in every step we take. And the admiration of nature's order and beauty would lead our minds to love and fear Him by whom all things are so fearfully and wonderfully made. *G. S.*

*Oat Bruising and Chaff-cutters.*—I quite agree with "Baddow (Basildon?) Park," as to the advantages derived from the plan. I have been in the habit of using one for 14 years, having bought it when I only kept one nag, a delicate feeder; it is astonishing the difference it makes in their condition, several instances of which I might give you, but one will suffice. I have a hunter belonging to a friend of mine, which has been going his two days a week with hounds, sometimes three; yet positively fattens on his work: whereas, the last two seasons, he has looked tucked up, though with less work, and quite as good (unbruised) corn. A horse will do better on two bushels of bruised, than the same quantity of whole corn; consequently there is a saving of at least a bushel a week each horse, minus the expense of crushing, which is trifling. They should be smooth steel rollers, and no flutes in them, as for Beans, which I also have cracked by another machine; chaff, too (chopped hay with a little straw), I always give with both the above. Greedy feeders are in the habit of swallowing many Oats whole, which do more harm than good; were they bruised, no nourishment would be lost. Look at the Oats, spilt from the nose-bags, about London, you will find them almost all bruised. The only disadvantage I am aware of is, the horses miss them when fed away from their own stable. *Cottager, Jan. 2.*——Economy in these matters is of great importance. May I ask your correspondent, of "Baddow Park," if he advises that all the hay be cut into chaff before being given to the animals; I allude more especially to milch cows and horses. It has seemed to me that when chaff in considerable quantities has been given, they have not liked it so well as uncut hay, and considerable waste has arisen from their knocking it out of their manger. Again, in the case of cows, as they reproduce all their food to chew again, would not the advantage insisted on by your correspondent be lost? *D. W.*

*Rain in 1850.*—More than once during the past year, I noticed some statements in your Paper, relative to the quantity of rain that had fallen, up to that particular time. On referring to my own observations, I found a great difference to exist between what had fallen here and at Chiswick (I presume), and as many of your readers now take an interest in facts relating to our climate, I have ventured to send you a digest of our observations, taken at an elevation of about 400 feet above high water mark. Quantity of rain in each month in 1850—in inches.

*Linseed as Food for Cattle.*—In answer to your correspondent, "B. S.," I beg to inform him that I discontinued the use of fire in the preparation of cattle food about two years since. Prior to my doing so, I discovered that a gelatine, formed by soaking Linseed-meal 24 or more hours in cold water, was more economical and efficacious than that obtained by boiling. I cannot now enter into particulars, but they are fully described in my pamphlet entitled "Flax *versus* Cotton," a copy of which I had the pleasure of sending to your office in London. It is still to be had of Ridgway, and I beg to add that the system which I so successfully practised at Trimingham, upon less than 100 acres, is being introduced here upon more than 1000. *John Warnes, Bolwi k-hall, Marsham, Norwich.*

*Mechi's Farming.*—Every one interested in agriculture must have read with pleasure Mr. Mechi's statement, giving an account of the expenses incurred on Tiptree farm, and the anticipated profits in the year 1851. It is more than probable that a fair return will be received on the capital laid out on the land, taking the average of a certain number of years. The only fear is that the buildings attached to the farm will swallow up everything in the shape of cash figuring on the credit side; at the same time it is to be hoped they will not be so; and even should such be the case, it is some consolation to think the circumstance will neither affect Mr. Mechi's comfort, nor disprove his statement, that draining, and the employment of more labour on the land, are essential to enable the English farmer to compete with free trade. However, the contrary system appears to be followed in too many instances; men, as produce cheapens in the market, relaxing their efforts in the cultivation of the soil; a mistake which many will, in the long run, bitterly rue. Although agriculture cannot at once rival horticulture, yet there is no reason why it should not make some approach to it; in fact, it only requires capital to give the farmer a fair chance in the race with the gardener. It is really surprising to see anything grow on stiff undrained land, ploughed 4 inches deep, scarcely enough to cover the weeds, much less kill them. It must be admitted that land in the United Kingdom is not cultivated to its full extent; even much of what has been under the farmer's care for years, does not produce its fair quota of food for man and beast. It is worse than folly to ridicule high farming, or rather confound it with extravagance. However annoyed tenants may be at the lowness of prices, they may rest assured it is only by increased exertion on their parts, and employing more labour on the land, they can hope to obtain remuneration. Farming is, like most trades, not so lucrative as it was some years ago, but still worth something to an industrious sensible man, who has not accustomed himself to a luxurious mode of living, spending the whole of his income, when he ought to have preserved a trifle for a "rainy day." *Falcon.*

*A few words on Rearing Poultry.*—This is a point of farming treated with much contempt by most farmers, particularly large ones; but I hope to put it in a better light, after relating a story, well known to me for a fact:—A man, who held something over 300 acres, was, on the approach of rent day, much behind, and, like most men under those circumstances, felt particularly miserable for some days. His wife restored his good humour by putting into his hand 200*l.* in notes, saying, at the same time, "you have always found fault with my poultry, saying, that they eat so much corn, and you never could see any benefit, beyond having a fowl for dinner now and then, and a goose at Michaelmass, a turkey at Christmas, &c. (those are no trifles to those who have to purchase everything). Now you see that the despised poultry are your best friends." I may add that this saving was in addition to finding clothes for herself and four daughters; no small sum, though not so much as lady farmers require now-a-days. I would recommend turkeys first, having had the most profit from them myself, and they make a large quantity of better guano than you can buy of most dealers in that article, if, instead of putting a quantity of straw into the place they roost in, you use burnt earth, or coal ashes, sprinkling a small quantity over the floor every day; you will accumulate such a quantity as will astonish any one, who has not tried this plan, and it answers equally well for pigs and sheep, and they do better than on nasty rotten straw; they require a little dry straw in the inner place where they sleep. Turkeys are more tender when quite young than other poultry, and require much attention for the first six weeks or two months; afterwards they do very well any way, and, I believe that turkey at 9*d.* per pound (about the average price in London), will pay better than either mutton or beef at 4½*d.*; and after they are two or three months old, they will eat everything that a bullock or sheep will, with the exception of hay and chaff, but they eat much Grass, and will do well on Turnips, Carrots, or Mangold steamed and mashed up with Barley-meal or Rice. It is not necessary to give the detail of the management (as there are many excellent books on the subject), but I will state what has been my general experience as to their weight. I have always endeavoured to have them hatched about the middle of April, as they do not get to the weight if later, and sell most of the hens the beginning of November. They generally average 8 or 9 lbs., and fetch six or seven shillings. The cocks are kept till Christmas, and weigh from 16 to 20 lbs. and are worth from 12 to 16 shillings. *E. X., near Braintree, Essex.*

## Reviews.

*Agricultural Physiology, Animal and Vegetable. Designed for the use of Practical Agriculturists.* By T. Lindley Kemp, M.D. Blackwood and Sons, Edinburgh and London.

It has latterly become too much the fashion to consider only those books *useful* to the farmer which shall impart economical methods, or directly profitable truths relating to his business. Dr. Kemp's work may not be able to do either the one or the other; but that it will be useful to those for whom it is designed, we have not the smallest doubt. We have read the book with a great deal of interest, and so we doubt not will it be read by many. It teaches general truths, which, if not of immediate *£ s. d.* applicability, will surely influence our practice ultimately; and already, as the Appendix to the work proves, have many of them been brought to bear in agricultural practice. In a work which describes in the course of 220 small octavo pages, the chemical and vital laws of nature; the classification of plants and animals; the conditions necessary to the continuance of life; the circulation of fluids through living objects; the process of nutrition; the food of plants and of animals; the respiration of plants and animals; the nature and operation of the nervous system; the reproduction of plants and animals; the species and varieties of cultivated plants and domesticated animals; and that arrest of all activity, which we call death—in a work which has such a table of contents for so small an amount of contents, and where every subject must therefore be very tersely and shortly given, it is difficult to select any passage which is able to give the reader a general view of the performance. Perhaps the following may suffice:—

*On a Difference between Plants and Animals.*—"Vegetables perform two very important functions. As we shall afterwards see, a quantity of carbonic acid gas is constantly issuing from man and all animals into the atmosphere. Now, this gas is very poisonous; and if it were not removed from the air, all the higher animals would very speedily perish. Vegetables have the power of taking this carbonic acid gas from the atmosphere, and of converting the carbon of it into part of their own structure. Then, while animals and plants are composed of the same elements, we shall afterwards find a great difference to exist between them as to the source of their elements or their food. Vegetables can take the elements of which they stand in need, when these elements are subject to chemical laws, that is, from the inorganic world. Thus guano (or farm-yard manure) contains nitrogen, phosphorus, soda, lime, &c.; and properly prepared soil contains all the elements whose combinations form the different structures of plants. Now, when these substances are brought to the roots of plants (which are analogous to the mouths of animals), these roots can take them in, and can then combine them so as to form the stem, leaves, flowers, &c. But it is quite different with animals: they cannot digest inorganic matter—*i. e.*, they cannot convert inorganic matter into their own structures. If the chemical elements of which an animal is composed be put into its mouth in an inorganic state, they may be swallowed, but they are never turned into its texture, but either poison it or are excreted. The food of animals must consist of the elements of which they are composed in an organic state; *i. e.*, in a state of subjection to the laws of life, and not of chemistry—or, in other words, of flesh and vegetables—before they have putrified. The important function which vegetables serve in converting the inorganic matter placed upon the surface of the earth into a state which can serve for the food of animals, will now be evident."

*On the Nourishing Fluid of Plants and Animals respec-*

*tively.*—"The first remark to be made upon the nourishing fluid of plants is, that it always contains a substance of the nature of gum or sugar. The properties of gum will be considered in the next chapter, as well as that of the other substances immediately to be alluded to. We shall here only mention that it consists of carbon, hydrogen, and oxygen. That the basis of the nourishing fluid of plants should be gum is very intelligible, when we consider that the greater part of the structure of plants (which structure is of course formed out of the nourishing fluid) consists of the same elements as gum does. We may specify wood or woody fibre, the waxes of plants, their oils, resins, &c. But the nourishing fluid of plants must contain also the other elements which, although in much smaller quantities, make up the structure of vegetable beings. Many parts, for instance, of plants contain nitrogen, and all plants contain some of the following elementary bodies,—potassium, calcium, magnesium, sodium, silicon, aluminum, iron, manganese, sulphur, phosphorus, and chlorine. The nourishing fluid of any plant must and does contain all the elements of which the structure of that individual plant is composed. Besides providing for their own structure, plants lay up a store of nutriment for the young embryo that springs from them. This must likewise be formed from the nourishing fluid. This substance, we may add, is always insoluble in cold water, and is known by the name of starch. It is obtained in abundance from Potatoes and other roots, from flour, and from many other vegetable products. When we come to examine the blood of animals, or of man, we find that it bears an exact analogy to the nourishing fluid of vegetables. As it not only forms but keeps up (for we shall soon have occasion to see that animals differ from plants, inasmuch as their structure is always wasting) every part of the body, it must contain all the elements which the body is made up of; and as it is continually parting with these, it must receive a continual supply of them. This supply is obtained at the stomach in the shape of food, and at the lungs in the shape of air. But as few animal substances do not contain nitrogen, the compound which is, as it were, the base of blood is not a substance composed of carbon, oxygen, hydrogen, like gum, but is a compound of carbon, oxygen, hydrogen, and nitrogen. It is called albumen, and its properties will be considered in the next chapter. Although, however, albumen is the basis of blood, it does not appear that it can be directly converted into animal tissue. A slight alteration is made in the proportion in which its elements are united, and another substance called fibrin is produced. To use a very ingenious comparison of Dr. Carpenter's, albumen, fibrin, and organised tissue, bear the same relation to one another, that raw cotton, cotton yarn, and woven cloth do. Fibrin may be easily obtained from blood by stirring this fluid with a stick, to which the fibrin will adhere. Fibrin can, by vital forces, be converted back again into albumen; and this we shall afterwards see is effected in those animals whose food is flesh. The blood, then, of man and the higher animals consists of albumen, because this substance can be converted, by the vital forces, into fibrin; a substance fitted, by its constitution and properties, for the repairing and renewing the greater part of the constantly wasting organs of the body. But as the body contains, although in much smaller proportion, other elementary bodies besides the carbon, oxygen, hydrogen, and nitrogen, which constitute fibrin, the blood must also contain these. And we find that it does. In the blood we can detect potassium, sodium, calcium, magnesium, silicon, aluminum, iron, sulphur, phosphorus, and chlorine. Carbon also exists in blood, in the form of carbonic acid. The blood also contains ready-prepared oil or fat. We saw that plants laid by a store of future nutriment, in the shape of starch. The office of fat seems analogous to that of starch; and, what is very curious, we shall afterwards have occasion to see that animals have the power of converting starch, taken as food, into fat."

*On Poison.*—"Poisons act as powerfully upon plants as upon animals. Moreover, plants constantly exposed to the influence of slowly-acting poisons, become diseased and out of health. When speaking of the unfertile soil (p. 118), we mentioned that the cause of its unfertility was probably the excess of iron in it. Indeed it would appear that an excess of any of the alimentary principles necessary for the food of plants, acts as a poison. This is very well exemplified in the following table, extracted from Mr. Johnston, and containing the result of an experiment made with guano. The quantity of land experimented upon was a Scotch acre.

| Quantity of guano. | Effect upon Turnip Crop. | Effect upon after Wheat Crop. |
|---|---|---|
| 4 cwt. | Good Turnips, 18 tons. | Good Wheat. |
| 8 ... | Very indifferent, 14 tons. | Inferior. |
| 16 ... | Grew up wonderfully, looked beautiful, but there was little bulk. Produce 10 tons. | Stubble black, grain dark and not larger than small Rice. |

"Nothing is more prejudicial to most plants than the continual presence of water at their roots. Part of the evil effect so produced may be attributable to the low temperature at which soil, in which water is also present, is kept; but another part of its bad action must be attributed to the very diluted state of the food of the plant. This causes the plant to be unable to absorb a sufficient amount of nutriment. It also prevents the carbon of the humus from combining with the oxygen of the air. The remedy is of course thorough draining. It sometimes happens that a crop at first grows very healthily; but at a certain period, when its roots penetrate deeper, it sickens, withers, and dies. This is probably owing to the subsoil containing matters which are poisonous to the plant. Indeed, a minute inquiry into the action of poisons upon plants would be a very valuable contribution to scientific agriculture."

We may add that the work is nicely illustrated with instructive woodcuts.

## METEOROLOGICAL REPORT.—Dec.

(*Continued from page* 14.)

[Our readers are requested, in our last week's report, to draw a line across the type below 10 p.m, Dec. 2d, which was accidentally omitted.—Ed.]

| Date. | Time. | Max. | Min. | Wind. | Remarks. |
|---|---|---|---|---|---|
| Dec. 10 | 8 a.m | 30.06 | ... | E | Very little wind during these days, but foggy, with occasional rain. |
| | 10 p.m. | ... | 29.95 | E | |
| 11 | 7.30 a.m. | 29.85 | ... | S | This storm travelled Northward, and must have lain a long way off to the Westward. |
| | 10.30 p.m. | ... | 29.78 | S | |
| 12 | 7.30 a.m. | ... | 29.80 | SW | |
| | 10.45 a.m. | 29.82 | ... | WSW | |
| | 10.30 p.m. | 29.82 | ... | SW | Much rain with this storm, which came from the Southward and Westward, with heavy thunder and lightning about 5 to 6 p.m., on the 14th. This storm passed off to the Northward |
| 13 | 8 a.m. | 29.71 | ... | SW | |
| | 10.30 p.m. | ... | 29.00 | SSW | |
| 14 | 11.25 a.m | 29.58 | ... | S | |
| | 5.30 p.m | ... | 29.35 | S | |
| | 10 p.m. | ... | 29.35 | S | |
| | 10.40 p.m. | 29.41 | ... | S | |
| 15 | 8.25 a.m. | 29.35 | ... | S | Heavy wind early a.m. on the 15th, and again towards night. It was difficult at that time to say which quarter it did not come from. This storm probably crossed Ireland and the South of Scotland. |
| | 10.35 p.m. | ... | 28.94 | S | |
| 16 | 6 a.m | ... | 29.14 | SSW | |
| | 9 a.m | 29.21 | ... | SSW | |
| | 11 a.m. | 29.19 | ... | SW | Heavy rains with this storm, blowing heavily in the evening. This storm probably crossed the North of Scotland, having come from the Westward. |
| | 4.30 p.m. | ... | 28.98 | SW | |
| | 6 p.m. | ... | 28.98 | | |
| | 10.30 p.m. | 29.15 | ... | WN | |
| 17 | 8.30 a.m. | 29.17 | ... | S | This storm probably went over Holland. At 1.26 p.m. noticed very remarkable appearance of strata of dark clouds, from NW to N by E, with cumuli of white masses rising behind them to N by E. |
| | 3 p.m | ... | 28.98 | SW | |
| | 5.30 p.m. | ... | 29.01 | SW | |
| | 11.15 p.m. | 29.18 | ... | SW | |
| 18 | 7.30 a.m | ... | 29.26 | NW | |
| | 0.30 p.m | 29.30 | ... | | |
| | 2.40 p.m | 29.22 | ... | SE | Raining towards sunset. This storm came from the Bay of Biscay, with little wind and not much rain. It went off to the North, producing hard frosts on the 19th, 20th, and 21st, being the effects of the back current of a storm rotating in a colder latitude. |
| | 6 15 p.m | ... | 29.05 | S | |
| | 10.50 p.m. | ... | 29.05 | WSW | |
| 19 | 7.45 a.m. | ... | 29.10 | N | |
| | 10.30 p.m. | 29.75 | ... | | |
| 20 | 8 a.m. | ... | 29.98 | N to | |
| | 7 p.m. | 30.10 | ... | NW | |
| 21 | 8 a.m. | 30.11 | ... | Calm | |
| | 11 a.m. | 30.11 | ... | | A storm passing at a great distance to the Westward, so great as not to alter the current produced by the previous storm. The wind during its passage was light and northerly. |
| | 1.30 p.m | 30.09 | ... | | |
| | 6 p.m. | ... | 30.06 | | |
| | 10.30 p.m. | 30.10 | ... | | |

| | 11.40 p.m. | 30.40 | ... | | |
| 23 | 7.30 a.m. | 30.40 | ... | | |

Dorchester, Dec. 24th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

### DECEMBER AND JANUARY.

Dorset Farm, *Dec.* 31.—At this season of the year there is little that can be said about the work of the farm. Everything is dull, and the out-door work as little exciting as at any time of the year. The chief attention is directed to feeding our cattle and sheep. Our fatting beasts are now getting Swedes and Mangold Wurzel cut together, as many as they can eat; with hay twice a day, and 4 lbs. Linseed-cake each per day. The Turnips are cut in slices, with the Mangold Wurzel. Our fatting sheep are tied up, and stand on bearded floors, having their Turnips cut small, and 1 lb. of cake each per day. In this way they do very well, but great care must be taken to keep the house clean, for if much dung is allowed to accumulate below them, they will soon show the bad effects produced by its fermentation. It ought never to lie until fermentation commences. We give our store pigs, such as sows and growing ones, nothing but raw Mangold Wurzel, and they thrive very well on it and eat it heartily. The younger ones have also as many of these roots as they will eat, amd besides have a little milk, with some Barley and boiled Turnips. And the fatting ones have, in the first stage of fatting, boiled Turnips, mixed with Barley meal, the proportion of meal being increased as they get riper. We have, throughout the autumn, and up to the present time, had very mild weather, and, consequently, have had no slip lambs. Wheat is everywhere looking well, and work is now far advanced; the only ordinary work now is carrying the dung to the fields, and when dry, ploughing some of the land for next Turnip crop, leaving it as rough as possible, to get exposed to any frost that we may have. *G. S.*

Lammermuir Sheep Farm, *Jan.* 3.—The weather during the past month has been very fine—for December; only a moderate fall of rain, little frost, and no snow. The past autumn, as might have been expected, has been highly favourable for hill sheep. With such mild weather they are in excellent condition, while the dryness of the season has effectually swept away the rot, even on the "softest" grounds. No doubt our severest storms are after the new year, but their danger is greatly lessened when the sheep meet them in good spirits, for though their previous good condition will not, like the far-famed fat of bears, sustain them comfortably during months of frosts and snows, when nothing else is to be got, yet it goes a great way, and enables them to bear up against and come through many a privation, which would soon crush them did it overtake them when already in a poverty-stricken state. The rams having been among the ewes for six weeks, will be removed in the course of a few days, and receive a small allowance of Turnips in one of the inclosures. It is the practice of some stock-masters to allow them to remain constantly among the ewes, only removing them for a few weeks in autumn, when the ewes begin to come in season. Though a saving in expense in artificial food is thus secured, we think that this is more than counterbalanced in several ways. They are never in that condition which is desirable in this description of stock, and, if you are a ram breeder, can never be shown to advantage. There is also the annoyance of lambs dropping for weeks and even months after the regular season. These may, indeed, for awhile supply the farmer's family with a kind of "house lamb," but are of very little market value; and we quite agree with the common remark, that "an eild (barren) ewe is better than a late lamb." Then, again, where it is the practice to graze the ewes and ewe hogs together, a piece of cloth is sewed over their tails to prevent them having lambs. This appendage is uncomfortable at any time, but particularly so during frost, and is taken off whenever the rams are removed from the ewes. When all the kinds remain together during winter, the hogs must either be subjected to this annoyance, or many of them will be seriously injured, if not destroyed, by having lambs at an age when the nature of their pasture renders them utterly unfit, not to nurse them merely, but even to bring them forth. The work on the arable part of the farm has consisted of the ploughing of Oat stubble for the Turnip crop; the storing of them during dry weather, and the carting out of manure for the next year's crop during frosts. The stubble ploughing is now completed; a considerably larger breadth than usual having prevented its being all turned over until a later period than we would have liked. The ploughing of lea for Oats is begun, and, with favourable weather, will be finished during the present month. Those Turnips which we purpose consuming on the ground with the ewes, have been all earthed up to preserve them from frost. This operation we perform with the common plough, giving each drill a single furrow. Taking in any convenient number of drills, the plough (with two horses) starts in the middle, and taking a furrow from the edge of the drill, going as near to the Turnips as possible without touching them, throws it on the top of the one next; it returns down the second drill to the right, and removes a furrow from it also, and proceeds round and round in this manner until the whole piece is completed. As the drill at the closing has been pared from both sides, a furrow is thrown back upon it from the drill next it. We have tried the double mould-board plough for this purpose, but found, especially on steep ground, at a season when the soil is damp and does not readily leave the moulds, that the draught was too severe for two horses, while the work was neither faster nor better done. Besides being an excellent preservation to the Turnip roots, this operation acts in a very beneficial way upon the soil, by exposing a much larger surface to atmospheric influences. The whole of our crop of Swedes has been lifted and stored in long heaps, which are first covered with a few inches of straw, and then with Heather turf from the moor, cut in pieces about 18 inches square and 1 thick. These are laid above the straw, lapping slightly over one another like slates on a roof, and prevent the entrance both of frost and rain. In spring, when their present office is over, we purpose charring and mixing them with manure for the Turnip crop. In taking leave of 1850, we must say that, upon the whole, it has been a good year for the stock farmer, at least he has been much better off than his brethren on arable farms. The past season has been remarkable for fine, dry, warm weather, consequently our stock have been healthy and in excellent condition; markets for lambs and other lean sheep have been relatively higher than those for fat, while the price for wool has risen considerably from the previous year—Cheviot wool being at what we never can take it above, and grumble when it falls below, 1s. per lb. Not but that we have been feeling the pressure of the times also, for we believe that were our stock sold off now, it would not bring within 30 per cent. of its value a few years ago. Most sheep farms in this district have 100 or 200 acres under the plough, but this, except in as far as it produces hay and Turnips to assist the sheep through the winter and spring months, is, in very few cases, a source of direct profit, but rather the reverse. We can answer for ourselves, that if we can grow as much corn as suffices to pay the shepherd's meal—sow the next crop—and keep the horses eating, we consider we have done well, having oftener fallen short of than exceeded this mark. An elevation of from 700 to 900 feet, is too great to be profitably farmed in any other way than as a sheep walk. *A Lammermuir Farmer.*

Central Yorkshire, *Dec.* 31.—Throughout the whole of this month the weather has been extremely variable, occasional frosts have intervened with storms, and a thick foggy atmosphere; on the whole there has been an unusually small quantity of rain for the season; and altogether the month has been favourable for farming operations. The young Wheats are showing a full and healthy plant; the Turnips have continued to grow throughout the month, and winter feed for sheep was never more abundant. We have finished storing our Swedes for spring consumption, and our sheep are still on white Turnips, their quality continuing very good. The weather having been so mild throughout the month, the cattle in the yards have consumed straw very slowly. Our lean cattle—in fact nearly all throughout the country have been suffering from the disease in the mouth and feet; but we have been free from pleuro-pneumonia for some time. A portion of our fat cattle have gone to market; we have realised about 5*s.* 9*d.* per stone for prime heifers and bullocks. Our draft ewes of last year are now going to market from Turnips. At last sale we made 42*s.* per head, for 28 lbs. per quarter sheep, a miserable price indeed. Pork feeding, although grain is so cheap, has been a losing concern, the article making only from 3½*d.* to 4*d.* per lb. Our principal farm work during the month has been ploughing stubbles for white Turnips, deep ploughing land for Swedes and Potatoes (this land having been previously scarified and weeded), ploughing Turnip land for Barley, threshing Barley, and, during frost, carting manure from yards to couch, and to distant fields. We have also been engaged in stubbing up some crooked and imperfect fences, and in replanting the same. *J. S., Kirk Deighton.*

## Notices to Correspondents.

Carts: *Tuesday.* We do not know Busby's prize cart. He lives near Bedale, Yorkshire; neither do we know where Mr. Rogers's peat-charcoal is sold in London. Perhaps this notice may elicit information on both points.

Charcoal: *Charcoal and others.* In a future number full details shall be given.

Chicory: *Rev E P.* The roots should be chopped up, after being cleaned, in sizes about an inch cube, and spread in a hop kiln to dry, as soon as possible after being removed from the ground. The most economical method for the farmer is to sell them raw. There is ample demand for them. We could sell hundreds of tons if we had them, without difficulty, at 50*s.* a ton.

Draining Tiles: *W.* They are burned by themselves. We hope to give the whole subject very soon. The wash of a house, exclusive of closet, is worthy of being conveyed by drain to the farm tank.

Dimmery's Hoe. The hoe is 10 inches long in the blade, elliptical, nearly 5 inches broad, rounded at the handle end, and pointed at the working end. It is not sold by ironmongers. Your blacksmith can make it from this description.

Field near London: *J W.* It is quite impossible to name the rent of a field from a description of it. Any soluble poison in the soil may be got rid of by draining and *patience.* If you can grow Mangold Wurzel on it, that will probably be as

good as any other means of making money off the land near London.

FLAX: *Anon.* It is doubtful if the process of dry-retting will ever answer. It is no new attempt, and we think it has always failed.

GRASS SEEDS. *S.* Sow your mixture late in March, when the ground is moist. We would not sow earlier. Your three years feed would be better thus: 18 lbs. of Rye-grass, 1 lb. of Timothy Grass, 3 lbs. of red Clover, 3 lbs. of perennial red Clover, 4 lbs. of white Clover, 2 lbs. of Hop Trefoil. And the one year's feed should be from 18 lbs. of Rye-grass, 1 lb. of Timothy Grass, 8 lbs. of red Clover, and 2 lbs. of white.

HOSE: *A Z.* The gutta purcha tubing answers perfectly for liquid manure, and is probably as good as any. But we should be glad to have the experience of correspondents on this subject.

IRISH MOSS: *M B.* It is Carrageen Moss. Probably the same as the specimen formerly received. We do not know any other address than that given Dec. 7.

MANGOLD WURZEL: *G B P.* We have used the sweet liquor from the steaming Mangold Wurzel to throw over straw chaff and meal for cattle. Oats at 1*s.* 10*d.* per bushel are cheaper than oilcake at 8*l.* per ton. The only objection to coarse bone-dust for dissolving in acid is the longer period of time needed for their solution.

ON FEEDING WHEAT IN SPRING: *G Ensor* asks our farming readers their opinion of feeding Wheat off with sheep in spring. We should prefer mowing it—as we have often, in the case of luxuriant grassy Wheat, been forced to do. He asks:—"Does it tend to thicken or thin the crop? Does it retard the period of ripening? Does it cause a shorter straw? Till what period, on early sown Wheat, might sheep (if at all) be permitted to remain?"

RAILWAY: *X Y Z.* Mr. Neilson has been kind enough to promise a statement on the subject. We must not complain of the delay.

SHEEP: *A R.* We have often folded young sheep on Turnips all their first winter, and made good mutton of them in the following May and June, selling them naked.—*S.* Oat-sheaf cut into chaff is capital food; 16 to 20 lbs. of Mangold Wurzel, and Oat-sheaf as much as they will, is food for one day.

STRAW: *Anon.* The consumption of all the straw as food is not likely to affect the growth of straw in the land. It is much the same thing whether it reaches the land after digestion in the animal or after rotting in the dung-heap. Mildewy, fusty straw, had better be used as litter than as food.

TURNIPS: *Vice-regal Lodge.* We always clean ours with a knife, which costs 2½*d.* per ton, done by task work. 1000 tons have been contracted for, for 10*l.*, this winter. We have never had them washed; and an experiment in the "English Agricultural Journal," vol. vi., p. 370, seems to indicate that the unwashed roots do best, but a single experiment cannot determine the point; and if we could get our roots washed for as little as we can get them cleaned by knife, we should prefer the plan which cleaned them best.

# Markets.

## COVENT GARDEN, JAN. 11.

Hothouse Grapes, although becoming scarce, have not altered in price since our last account. Pine-apples are a trifle dearer, as are also Apples and Pears. Oranges and Lemons are plentiful, and improving in quality. Nuts remain nearly the same as last week. Amongst Vegetables there have been some excellent Seakale, Asparagus, and Rhubarb. French Beans, Carrots, and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1*s.* 3*d.* per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Gardenias, Bignonia venusta, Chrysanthemums, and Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 5*s* to 8*s* | Pomegranates, each, 3*d* to 6*d* |
| Grapes, hothouse, p. lb., 4*s* to 6*s* | Almonds, per peck, 6*s* |
| — Portugal, p. lb., 8*d* to 1*s* | — sweet, per lb., 2*s* to 3*s* |
| Pears, per doz., 1*s* to 3*s* | Chestnuts, per peck, 2*s* to 5*s* |
| — per half sieve, 6*s* to 15*s* | — per 100, 9*d* to 1*s* 6*d* |
| Apples, dessert, p. bsh., 6*s* to 10*s* | Nuts, Barcelona, per bush, 20 to 22*s* |
| — kitchen do., 5*s* to 8*s* | — Brizil, p. bsh., 12*s* to 14*s* |
| Oranges, per doz., 9*d* to 2*s* | Filberts, p. 100 lbs., 60*s* to 65*s* |
| — per 100, 6*s* to 10*s* | |
| Lemons, per doz., 1*s* to 2*s* | |

### VEGETABLES.

| | |
|---|---|
| Brussels Sprouts, p. hf. sieve, 1*s* 6*d* to 2*s* | Leeks, per bunch, 1*d* to 2*d* |
| Cabbages, per doz., 6*d* to 1*s* | Shallots, per lb., 6*d* to 8*d* |
| Greens, p. doz. bun., 1*s* 6*d* to 2*s* 6*d* | Garlic, per lb., 4*d* to 8*d* |
| Cauliflowers, per doz., 4*s* to 6*s* | Artichokes, Jerusalem, p. half sieve, 1*s.* 6*d.* to 2*s* |
| Broccoli, p. doz. bundl., 10*s* to 12*s* | Lettuce, Cabbage, p. score, 1*s* |
| French Beans, per 100, 2*s* to 3*s* | — Cos, per score, 1*s* to 1*s* 6*d* |
| Seakale, per punnet, 2*s* to 3*s* | Endive, per score, 1*s* to 1*s* 6*d* |
| Asparagus, per 100, 3*s* to 8*s* | Small Salads, p. punn., 2*d* to 3*d* |
| Rhubarb, p. bundl., 1*s* to 2*s* | Horse Radish, p. bundl., 1*s* to 4*s* |
| Potatoes, per ton, 60*s* to 100 | Red Beet, per doz., 6*d* to 1*s* |
| — per cwt., 3*s* to 5*s* | Mushrooms, p. pot., 1*s* to 1*s* 3*d* |
| — per bush., 1*s* 6*d* to 2*s* 6*d* | Sorrel, per hf. sieve, 6*d* to 9*d* |
| Turnips, p. doz. bundl., 1*s* to 2*s* | Fennel, per bunch, 2*d* to 3*d* |
| Cucumbers, each, 1*s* 6*d* to 4*s* | Savory, per bunch, 2*d* to 3*d* |
| Radishes, per doz., 1*s* to 1*s* 6*d* | Thyme, per bunch, 2*d* to 3*d* |
| Celery, p. bundle, 9*d* to 1*s* 6*d* | Parsley, per doz. bun., 1*s* to 3*s* |
| Carrots, per doz., 2*s* to 5*s* | — Roots, p. bundl. 9*d* to 1*s* |
| Spinach, p. half sieve, 6*d* to 1*s* | Marjoram, per bunch, 2*d* to 4*d* |
| Onions, p. bunch, 4*d* to 6*d* | Mint, per bunch, 2*d* |
| — Spanish, p. doz., 1*s* 6*d* to 4*s* | Watercress, p. 12 bunch., 6*d* to 9*d* |

### HAY.—Per Load of 36 Trusses.

SMITHFIELD, JAN. 9.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 75*s* to 80*s* | Clover ... ... ... | 70*s* to 80*s* |
| Inferior ditto .. ... | 65 70 | Second cut ... ... | 65 70 |
| Rowen ... ... ... | 60 65 | Straw ... ... ... | 22 25 |
| New Hay ... ... ... | — — | | J. COOPER. |

The supply short, but quite equal to the demand.

CUMBERLAND MARKET, JAN. 9.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 72*s* to 77*s* | Inferior ... ... ... | 65*s* to 70*s* |
| Inferior ditto... ... | 55 65 | New Clover ... ... | — — |
| New Hay ... ... ... | — — | Straw ... ... ... | 24 28 |
| Old Clover... ... | 75 80 | | JOSHUA BAKER. |

WHITECHAPEL, JAN. 9.

| | | | |
|---|---|---|---|
| Fine Old Hay ... | 68*s* to 72*s* | New Clover ... ... | —*s* to —*s* |
| Inferior ditto ... | 55 60 | Inferior ditto... ... | 63 70 |
| New Hay ... ... ... | — — | Straw ... ... ... | 21 24 |

### HOPS.—FRIDAY, JAN. 10.

Messrs. Pattenden and Smith report that the market continues the same.

### POTATOES.—SOUTHWARK, JAN. 6.

The Committee report that the market is well supplied with Potatoes, coastwise, Continental, and by rail, all of which, owing partly to the mild weather, are meeting a very dull sale, and though a considerable reduction in price has been submitted to, salesmen have been obliged to store many cargoes to clear the ships. The following are this day's quotations:—York Regents, per ton, 80*s.* to 100*s.*; Scotch do., 55*s.* to 70*s.*; ditto Cups, 55*s.* to 65*s.*; Cambridgeshire and Lincolnshire Regents, 50*s.* to 70*s.*; French whites, 50*s.* to 60*s.*

### COAL MARKET.—FRIDAY, JAN. 10.

Hollywell, 15*s.*; Eden Main, 15*s.* 3*d.*; West Hartley, 14*s.*; Wallsend Riddell, 15*s.*; Wallsend Haswell, 16*s.* 9*d.*; Wallsend Stewart's, 16*s.* 9*d.*; Wallsend Tees, 16*s.* 9*d.*—Ships at market, 226.

### SMITHFIELD, MONDAY, JAN. 6.

The supply of Beasts is large, and the average quality good. Trade is dull, at a reduction of about 2*d.* per 8 lbs. The number of Sheep for the time of year is sufficiently large. Prices of last Monday are barely supported. Trade is cheerful for Calves at rather higher rates. From Holland and Germany there are 286 Beasts, 1560 Sheep, and 116 Calves; from Norfolk and Suffolk, 1000 Beasts; from Scotland, 300; and 1400 from the northern and midland counties.

| Per st. of 8 lbs. | s | d | s | d | Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 6 | to 3 | 8 | Best Long-wools | 3 | 6 | to 3 | 10 |
| Best Short-horns | 3 | 4 | — 3 | 6 | Ditto Shorn ... ... | | | | |

| | | | | | Calves ... | 3 | 0 | — 4 | 4 |
| | | | | | Pigs ... | 2 | 4 | — 3 | 4 |

Beasts, 4082; Sheep and Lambs, 22,431; Calves, 160; Pigs, 310.

### FRIDAY, JAN. 10.

The supply of Beasts to-day is small, but more than equal to the demand. A clearance cannot be effected, although there is a disposition to take lower prices. The number of Sheep is about an average for the time of year; trade is cheerful at about Monday's quotations. There is more inquiry for choice Calves, and in some instances rather more money is obtained. From Germany and Holland there are 70 Beasts, 80 Sheep, and 155 Calves; from Norfolk and Suffolk, 300 Beasts; and 85 milch cows from the home counties.

| Best Scots, Herefords, &c. | 3 | 6 | to 3 | 8 | Best Long-wools | 3 | 6 | to 3 | 10 |

| | | | | | Calves ... | 3 | 0 | — 4 | 4 |
| | | | | | Pigs ... | 2 | 4 | — 3 | 4 |

Beasts, 539; Sheep and Lambs, 3310; Calves, 234; Pigs, 320.

### MARK LANE.

MONDAY, JAN. 6.—The supply of English Wheat to this morning's market was small, and much out of condition; the sale was difficult on the terms of this day sennight. Foreign was quite as much inquired after, but could only be disposed of at some reduction, which holders generally were not inclined to accept.—Barley moves off slowly.—Beans and Hog Peas must be written 1*s.* per qr. cheaper.—Oats were in limited demand, and our quotations barely supported.—Flour is a heavy sale, and late prices were with difficulty maintained.

FRIDAY, JAN. 10.—The arrivals of grain since Monday have been moderate; the attendance at market this morning was small. Wheat, Flour, and spring corn met a limited retail inquiry at our quotations. Floating cargoes of Polish Odessa Wheat are held at 34*s.*, which buyers are not willing to comply with. Maize has been sold at 30*s.* to 30*s.* 6*d.* per qr. afloat.

LIVERPOOL, FRIDAY, JAN. 3.—The supplies coastwise and from Ireland during the last three days have been unusually small, and from the United States we have not a single fresh arrival to notice. At our market to-day millers and dealers seemed disposed to remain inactive, and transactions in Wheat were limited in amount; still holders appeared firm, and all descriptions of this grain maintained our last currency. Malting Barley and Malt, upon a moderate demand, obtained late rates; grinding Barley in slow request, but not cheaper. Beans and Peas, moving sparingly, were the turn lower in value. Oats, meeting little inquiry, hardly supported the reduced rates of Tuesday. Indian Corn merely sustained former prices.—JAN. 7.—We have again to report very scanty arrivals of grain and Flour, coastwise and from Ireland. Having a tolerable number of millers at our Corn Exchange to-day, Wheat of all descriptions was held with rather more firmness than of late; buyers, however, continued to proceed cautiously, and the amount of business was only moderate, with little or no variation from the currency of this day se'nnight. In malting or grinding Barley, or in Malt, the transactions were limited and prices unaltered. English and European Beans hardly maintained our last quotations, and Egyptians gave way 6*d.* per qr. Peas nominally unvaried. Oats and Oatmeal barely supported previous quotations. The following are the prices: Wheat, English red, per 70 lbs., 5*s.* 6*d.* to 6*s.* 1*d.*; white, 5*s.* 9*d.* to 6*s.* 3*d.* Barley, Scotch and Irish, per 60 lbs., 3*s.* 2*d.* to 3*s.* 5*d.* Malt, English, per qr. pale, 50*s.* to 55*s.* Oats, English and Scotch, per 45 lbs., 2*s.* 8*d.* to 2*s.* 11*d.* Beans, English, per qr., 27*s.* to 31*s.* Peas, do. do., 29*s.* to 31*s.*

## GLASS FOR CONSERVATORIES.

JAMES PHILLIPS AND Co. have the pleasure to hand their New List of Prices of GLASS for cash.

CUT TO SIZE.

| | | | |

MILK PANS, from 2*s.* to 6*s.* each; METAL HAND-FRAMES, Glass Tiles and Slates, Propagating and Bee Glasses from 2*d.* each; Grape Glasses; Cucumber Tubes, 1*d.* per inch; Peach Glasses, Wasp Traps, Pastry Slabs, Hyacinth Glasses and Dishes, Fish Globes, Plate and Window Glass, Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 5*s.*; 6 tubes, 7*s.* 6*d.* GLASS SHADES.—Estimates and List of Prices forwarded on application

TO THEIR WAREHOUSE, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

## SMITHFIELD CATTLE SHOW.—MILK PANS,

in stout Glass, of every size and variety of shape, were exhibited as usual, Nos. 148, 149, 150, Bazaar, by Messrs. COGAN and Co., whose collections were honoured (among other Prizes) with the Silver Medal of the Dublin Society in April, as also with the Silver Medal of the Liverpool and Manchester Society, at their meeting, held at Warrington in September last.

NOBLEMEN, FARMERS, and the Public generally, are respectfully invited to notice the NEW GLASS CHURN. LORD CAMOY'S MILK SYPHONS for separating Milk from Cream, GLASS LACTOMETERS for ascertaining the quality of Milk, New Bee Glasses invented by Lord Keane, Glass Cream Pots and Pans, Glass Milk Trays, Glass Tiles and Slates, and every description of Dairy Glass.

Durable Farm Paints, Glass for Hothouses and Garden purposes, may be had (safely packed) for any part of the kingdom, or for exportation, on application at the Stands, 148, 149, and 150, or at the Warehouse, 48, Leicester Square, London.

Small Glass for Melon Pits of every size, from 10*s.* 6*d.* per 100 feet; Hartley's and Swinburne's PATENT ROUGH PLATE at the Manufacturer's prices,

Glass Ornamental Shades, Fern Shades, Lamp and Gas Glasses, Patent Glass Pens; Patent Texturalised, Silicated Marble, and other Ornamental Glass, supplied, as usual, at 48, Leicester-square; the Colour and Lead Department, at 5, Prince's-street, Coventry-street, London.

## GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

## GLASS FOR CONSERVATORIES, GREENHOUSES, PIT-FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes,

6 by 4 ins., 6 by 4½ ins., 6½ by 4 ins., 6 by 5½ ins., 6½ by 5 ins., 12*s.* each.

6½ by 5½ ins., 6 by 6 ins., 6½ by 6 ins., and under 8 by 6 ins., 13*s.* each.

9 by 7 ins., 9½ by 7½ ins., and 10 by 8 ins., 15*s.* each.

Large sizes, 16 oz., 2*d.* and 2½*d.* per foot.

Large sheets, in 200 and 300 feet cases, 2½*d.* to 2¾*d.* per foot.

16*s.* per box; or 2¾*d.* per foot if less than one box be taken:

| | |
|---|---|
| 11 inches by 8 inches | 13 inches by 9 inches |
| 12 ,, by 8 ,, | 12 ,, by 10 ,, |
| 12 ,, by 9 ,, | 14 ,, by 10 ,, |

Boxes charged 1*s.* each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

### ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

CUT TO ORDER IN PANES.

| | ⅛ in. thick. | ¼ in. thick. |

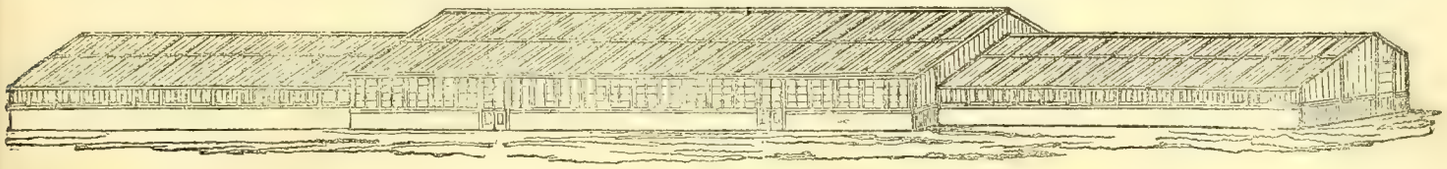
GLASS SHADES FOR ORNAMENTS.—Our price is 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the quality of Milk: four tubes in frame, 6*s.* each. Wasp Traps, 3*s.* per dozen. Stands for Pianofortes, 9*d.* each.

MILK PANS 2*s.* to 6*s.* each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Pastry Slabs; Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.



N.B. The moderate charge of 1*s.* for each packing case will be made, which we think will be an inducement for parties to retain them; but if sent back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

# GRAY AND ORMSON,

## DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

| Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft. |
|---|---|---|---|---|---|

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed,) "James Fraser, Gardener, Luton Hoo Park."

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

*Patron.*—H.R.H. Prince Albert.

The College will re-open February 12.

Terms per Annum.

Students in the College, on admission to which their age must not exceed 16—Under 14 years of age, 45 guineas; above that age, 55 guineas. Students in the Boarding House, 80 guineas. Out Students, 40*l.* There are no extra charges, except where separate sleeping apartments or private studies are required.—For further particulars respecting course of Studies, Lectures, &c., apply to the Principal, The Rev. J. S. Haygarth, M.A.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. Nesbit, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MANURES.—The following Manures are manufactured at Mr. Lawes's Factory, Deptford Creek:

| | |
|---|---|
| Clover Manure, per ton ... ... ... ... | £11 0 0 |
| Turnip Manure, do. ... ... ... ... | 7 0 0 |
| Superphosphate of Lime ... ... ... | 7 0 0 |
| Sulphuric Acid and Coprolites ... ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

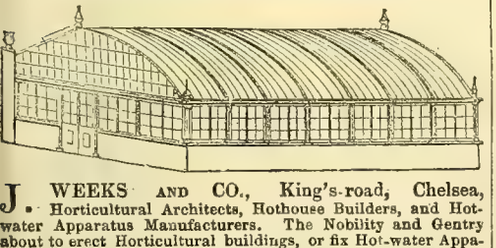
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.

CONCENTRATED URATE. SUPERPHOSPHATE of LIME.

PERUVIAN GUANO. SULPHATE OF AMMONIA.

FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.



Bridge-street, Blackfriars. Edward Purser, Secretary.

SUPERIOR BOG EARTH, OR PEAT, SAND, TURF, GRAVEL, and LOAM of the best quality supplied by Henry Breden, Gardener, and Seedsman, Canterbury-place, Shirley, near Croydon.

N.B. A large supply of very fine Prince Regent Potato fit for immediate planting.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

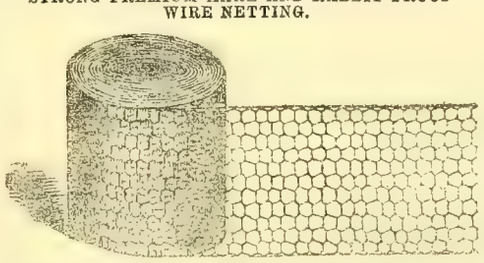
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.



STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, January 27, 1851, at 2 o'clock precisely, by order of Messrs. Antony Gibbs and Sons, the Importers, about 1200 tons (damaged) PERUVIAN GUANO. Catalogues and further particulars, in due time, from J. A. Rucker and Bencraft, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG and COMPANY (late W. and C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,

22, PARLIAMENT STREET, WESTMINSTER, LONDON;

48, NORTH BRIDGE, EDINBURGH;

32, ST. ENOCH SQUARE, GLASGOW;

1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

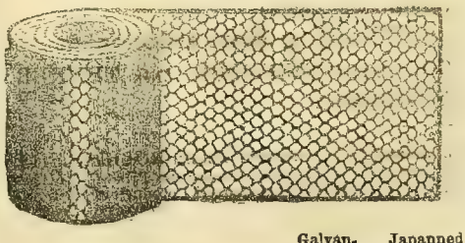
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | |
|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | .. .. | £3 15 0 |
| Do. of 100 yards, 24 ins. wide | .. .. | 5 0 0 |
| Do. of 100 yards, 30 ins. wide | .. .. | 6 5 0 |
| Do. of 100 yards, 36 ins. wide | .. .. | 7 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | | 12 ,, | 9 ,, |
| 1¾-inch ,, light ,, ... | | 8 ,, | 6 ,, |
| 1¾-inch ,, strong ,, ... | | 10 ,, | 8 ,, |
| 1¾-inch ,, extra strong ,, ... | | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

PERUVIAN BARLEY.

WM. WILSON, Nursery and Seedsman, Wimborn, Dorset, having saved some fine Seed of this valuable variety, can offer it at 5*s.* per peck, bag included. It promises to be of real importance to the Farmer, Maltster, and Brewer, for its excellent qualities, and the produce is very large. Agents in London.

Hurst and M'Mullen, Seedsmen, 6, Leadenhall-street, London.

MANURE DEPOT.

TO FARMERS, AGRICULTURISTS, &c., &c.

G. H. FOLEY, Essex Wharf, Lea-bridge, Middlesex, Agent, by appointment, to the Irish Amelioration Society, for the sale of IRISH PEAT CHARCOAL, an excellent Fertiliser, and when mixed with night-soil or sewage matter renders both inoffensive, and retains all their fertilising properties, and producing, combined, a very valuable Manure, at a remarkably low cost; capable of being conveyed in sacks or otherwise. Price of the Charcoal, in its pure state, 60*s.* per ton; mixed with night-soil, 45*s.* per ton, sacks included.

All needful particulars will be given upon application at the above address.

N.B.—If more convenient, an order will be given for the unmixed Charcoal upon the stores in Lower East Smithfield, London, where it will be delivered either for land or water conveyance.

If Cartage is required, 2*s.* 6*d.* per ton extra or more, according to distance.

PROVISIONALLY REGISTERED.

RAILWAY CATTLE INSURANCE COMPANY, (for the careful transit, and protection from injury, of Cattle, &c.)

Capital 20,000*l.*, in 4000 Shares of 5*l.* each.

Deposit 1*l.* per Share.

Application for the Shares, remaining at the disposal of the Board, must be made on or before Thursday, January 23d.

Prospectuses (with forms of application attached) may be obtained at the Company's Offices, 19, Essex-street, Strand.

By order of the Board, John K. Douglass, Sec.

CLOSE OF HOLIDAYS.

NOW that the season of annual festivity is about to terminate, and the respective boarding-schools reinstated by the busy throng of youthful aspirants, their personal comfort and attractions become naturally an object of great solicitude with friends and relatives. Now it is that ROWLANDS' MACASSAR OIL, for accelerating the growth and for improving and beautifying the hair, ROWLANDS' KALYDOR, for improving the skin and complexion, and removing cutaneous eruptions, and ROWLANDS' ODONTO, for beautifying the teeth and preserving the gums, must be universally considered indispensable. The august patronage conceded by all the Sovereigns of Europe to these creative and renovating specifics, and the confirmation, by experience, of their infallible efficacy, have characterised them as perfect, and given them a celebrity unparalleled. ☞ *Beware of Spurious Imitations.* The only genuine of each bears the name of Rowlands' preceding that of the Article on the Wrapper or Label. Sold by them at 20, Hatton Garden, London, and by respectable Chemists and Perfumers.

"KNOW THYSELF."

THE SECRET ART OF DISCOVERING CHARACTER FROM HANDWRITING is still practised by MR. ELLISON with astonishing success. His startling revelations of the mental and moral qualities, talents, and defects of his applicants, fill four pages of a sheet of paper, the style of description differing from anything yet attempted. Test this by sending any specimen of the writing of yourself or of those in whom you are interested (inclosing fifteen postage stamps), addressed to Mr. E. Ellison, Professor of Graphiology, 151, Strand, London.

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, Lea and Perrins, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "Lea and Perrins" are upon the label and patent cap of the bottle.

LONG EVENINGS MADE SHORT.

MECHI'S FAMOUS BAGATELLE TABLES, Manufactured upon the premises, 4, Leadenhall-street, London, make long evenings appear short, and combine calculation with amusement, price 3*l.* 10*s.*, 4*l.* 10*s.*, 5*l.* 10*s.*, up to 12*l.* Sold also by his Agents, Spiers and Son, Oxford; Powell, the Lounge, Leeds; Eastee, Liverpool; Woolfield, Glasgow; Thompson, Nottingham; Stephenson, Hull; Squiers, Dover; Steel and Rix, Norwich. None are genuine without Mechi's name.

THE BEST REMEDY FOR INDIGESTION.

"NORTON'S"

CAMOMILE PILLS are confidently recommended as a simple but certain Remedy, to all who suffer from Indigestion, Sick Headache, Bilious and Liver Complaints. They act as a powerful tonic and gentle aperient, imparting strength to the stomach, and composure to the nervous system. Sold in bottles at 1*s.* 1½*d.* or 2*s.* 9*d.* each, by A. Willoughby and Co., late B. G. Windus, 61, Bishopsgate-street Without, and nearly all Medicine Vendors.

Caution.—Be sure to ask for "NORTON'S PILLS," and do not be persuaded to purchase an imitation.

J. E. DOWSON, 123, OXFORD-STREET

(FIVE DOORS WEST OF REGENT-CIRCUS),

Is the Sole Manufacturer of the

PRIZE STOVE OF 1850,

Now Exhibiting in the Model Room of

THE SOCIETY OF ARTS,

*John-street, Adelphi, London;*

AND IS UNQUESTIONABLY THE

**CHEAPEST STOVE IN THE MARKET.**

IT HAS ALREADY BEEN EXTENSIVELY ADOPTED, AND IS KNOWN AS

## CUNDY'S PATENT IMPROVED OPEN FIRE-PLACE, WARM AIR, VENTILATING STOVE.

IT IS ADMIRABLY ADAPTED TO

WARM AND VENTILATE CHURCHES, CHAPELS, VESTRIES, SCHOOL-ROOMS, AND OTHER PUBLIC PLACES, HALLS, DINING-ROOMS, LIBRARIES, CLUB-ROOMS, &c.

THE ADVANTAGES OF THIS STOVE ARE—

1. That it combines the CHEERFULNESS of an open fire with the comfort of a constant supply of Fresh Atmospheric Air of a genial temperature.

2. That it consumes the IMPURE air of a room and replaces it by the admission of PURE air from without.

3. That it preserves the BALANCE between the CONSUMPTION of the impure and the ADMISSION of pure air so accurately that it effectually prevents BLASTS of cold air through crevices in doors and windows.

4. That it never raises the temperature of the air, which is warmed by passing through the stove, so high as to burn it, or impart to it any UNPLEASANT SMELL or INJURIOUS PROPERTIES.

5. That it imparts so large a proportion of its heat to the air in its passage into the room through it, that the SMOKE FLUE can never get so heated as to endanger the building, or to add to the risk in insuring.

6. That as nearly all the heat produced by the fire passes with the air into the room, and very little up the flue, it obviously economises the fuel.

The ADVANTAGES of CUNDY'S PATENT STOVES, therefore, are CHEERFULNESS and COMFORT, PURITY and WARMTH of the Air, the Absence of any Noxious Properties, FREEDOM from DANGER, and ECONOMY of FUEL.

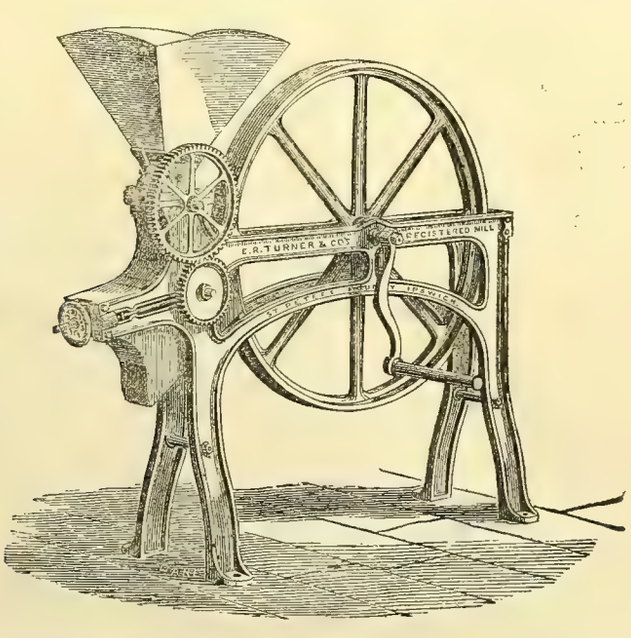
Letter from the Rev. MATTHEW O'BRIEN (Professor of Natural Philosophy and Astronomy), M.A., F.R.S., &c., King's College.

I beg to certify that one of Mr. Cundy's Patent Stoves was put up in my Lecture Room, at King's College, last year, in place of a Common Stove (of Arnott't construction, I believe). I have no hesitation in saying, from actual experience, that Mr. Cundy's Stove is far superior both in producing warmth over the whole room, and in promoting ventilation, without disagreeable currents of air, or close smell.

MATTHEW O'BRIEN.

From GEORGE HITCHCOCK and ROGERS, St. Paul's Churchyard St. Paul's Churchyard, March 7, 1850.

Dear Sir,—We have never had occasion to regret the substitution of your excellent Stoves for the hot-water apparatus with which our establishment was previously heated; all our customers seem delighted with the change.



The improved ventilation produced by them—the entire freedom from that smell of iron so common to most other stoves, and the agreeable sight of the fire—render them most desirable for such establishments as ours.

We are, dear Sir, yours truly,

GEORGE HITCHCOCK AND CO.

The STOVES may be obtained of the Sole Manufacturer, J. E. DOWSON, 123, Oxford-street (five doors west of Regent-circus), where a Stove is in constant operation. They may also be seen at Messrs. HITCHCOCK and ROGERS, St. Paul's Churchyard; and in the Model Room of the Society of Arts, Adelphi; from which Society Mr. CUNDY, on the 22d July, 1850, received their large SILVER MEDAL for the invention.

TO AGRICULTURISTS, HORSEKEEPERS, AND OTHERS.

## REGISTERED ROLLER MILL,

**(REGISTERED Dec. 10th, 1850. No. 2579.)**

**For Crushing Linseed, Oats, Malt, Barley, &c., and Breaking Beans and Peas, &c.**

MANUFACTURED BY E. R. TURNER AND CO., LATE HURWOOD AND TURNER, ST. PETER'S FOUNDRY, IPSWICH.

E. R. TURNER AND CO., whose long experience in the manufacture of the well known ROLLER MILL, first introduced from their works, and to which the Royal Agricultural Society annually award the Prize for the best Linseed and Corn Crusher, has enabled them to bring it to its present perfection, and have succeeded in producing a Mill well suited to the depressed state of Agriculture, the advantages of which consist in its combining the two processes of Crushing and Grinding; in its involving neither difficulty nor loss of time in altering from the one process to the other; in its simplicity and the ease with which it can be worked by one man, and in its moderate price, which is considerably less than that of any Common Roller Mill before offered to the public.

The above MILL was first exhibited at the late Smithfield Club Show, where it was unanimously approved, and great numbers of them sold.

| | £ | s. | d. |

AN UNLIMITED STOCK OF REMARKABLY FINE SEEDLING AND TRANSPLANTED LARCHES AT REDUCED PRICES.

WM. WOOD AND SON, being very extensive holders of the above, and all other kinds of seedling and transplanted Forest trees, will be happy to furnish prices on application.

N.B. Catalogues of Vegetable, Flower, and Agricultural Seeds, also of Nursery Stock, will be forwarded free.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

WE beg respectfully to acquaint our numerous PATRONS that we have now a good and healthy stock, our own growth, of most of the new and rare TREES AND SHRUBS, especially the former, which we have, by diligent research, collected from the Continent and other parts. To give an idea of their price, we may observe that they average about 30*s.* per dozen.

CHOICE SELECTIONS OF THESE NEW TREES AND SHRUBS WILL BE FURNISHED IN 5*l.* OR 10*l.* ASSORTMENTS.

KNIGHT and PERRY.

EXOTIC NURSERY, KING'S-ROAD, CHELSEA.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

SEEDS OF THE BEST QUALITY, CARRIAGE FREE.

J. C. WHEELER AND SON have had the honour of being appointed Seedsmen to the Gloucestershire Agricultural Association. Their Priced List of Seeds for this season is just ready, and will be forwarded free by post to any address on receipt of two postage stamps. This Catalogue is not a long list of useless names; it is really what it professes to be, a List of the best Seeds in cultivation, and will be found a safe guide to all purchasers.

Dr. LINDLEY, in the *Gardeners' Chronicle*, of the 2d March last, strongly recommends it in the following terms:

"THE CATALOGUE OF SEEDS SOLD BY J. C. WHEELER AND CO., GLOUCESTER, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless, incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."

J. C. WHEELER and SON deliver their Seeds CARRIAGE FREE. Kingsholm Nursery; and 99, Northgate-street, Gloucester.

SAMUEL FINNEY AND CO.'S CATALOGUE OF SEEDS, for 1851, is now ready, and may be had postage free, on application. It contains a Select List of all the most approved sorts of Culinary Vegetables in cultivation. Also an extensive collection of Flower Seeds, including the imported German kinds, with descriptions, stating the proper time for sowing, hardiness, duration, height, time of flowering, and the colour of each, with much other useful information. The collections of Seeds sent out last year by S. F. and Co. having given general satisfaction, they again offer them as under.

VEGETABLE SEEDS.—CARRIAGE FREE.

We prove the growth of each kind before we send them out.

LIBOCEDRUS CHILIENSIS.

Seedling plants ... ... ... 10*s.* 6*d.* each, 3 for 20 0

This is an Arbor-vitæ of recent introduction from Chili. Sir W. Hooker, speaking of it in the "Journal of Botany," says, "It is a tree 30 to 40 feet high, of great beauty, and well worthy of being introduced to our gardens."

All the above may be seen growing in the Nursery at Knaphill, which is within an hour's ride of London, being near the Woking Station, South-Western Railway, and from whence conveyances may at all times be had, and where every train stops.

The whole of the large plants mentioned were moved in the spring of the past year (1850), and H. WATERER will engage them to transplant again, and can be sent any distance with perfect safety.

Goods delivered free to any Railway Station in London.

AMERICAN PLANTS.

From the repeated exhibitions at the King's Road, Chelsea, and more recently at the Botanic Gardens, Regent's Park, this Nursery is well known as containing the most complete collection of American Plants in existence. Descriptive Catalogues of these, as well as of a most extensive general Nursery Stock, may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill, Woking, Surrey.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12s. per dozen. Also Myatt's Linnæus, 12s. per dozen; and Victoria, 9s. per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

CUTHILL'S "BLACK SPINE" and SNOW'S PRIZE CUCUMBERS at 1s. each packet; also his early Scarlet-flesh Melon, 1s. Listanthus Seed, 1s. per packet. CUTHILL'S Pamphlet of 56 pages, containing the Belgian Prize Essay on the best way of producing Potatoes; with 12 more articles on fruits and vegetables, among which are Asparagus, Rhubarb, and Seakale. The pamphlet has been very favourably reviewed by Dr. Lindley and others. Price 2s., or by post, 2s. 4d. The trade supplied with the Cucumbers.—JAMES CUTHILL, Denmark-hill, Camberwell, London.

AN Apprentice Wanted, aged 17. A small premium required. Two Shillings a week, with board and lodging.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Jan. 18.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2s. 6d. per lb. Also, his superior dark-green Savoy, 1s. 6d. per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

J. G. WAITE'S CATALOGUE OF VEGETABLE SEEDS is now Ready, with Prices to suit the times, and can be had on application.
181, High Holborn, London.

J. G. WAITE'S CATALOGUE OF FLOWER SEEDS is also Ready, and can be had on application.
181, High Holborn, London.

SION-HOUSE DWARF FRENCH BEAN, new, early, buff speckled. This is the earliest Bean known, and can be had in any quantity, price 21s. per bushel.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London, where every other kind of Seed in cultivation can be had, on better terms than at any other House in the Trade.

RHUBARB ROOTS TRUE TO NAME.—Myatt's Victoria, 6s. per doz; Myatt's Linnæus, 9s. per doz.; Mitchell's Albert, 9s. per doz.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London

STRAWBERRY PLANTS.—Ridley's Goliah, 10s. per 100; Myatt's Eleanor, 4s. per 100.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

NEW GIANT ASPARAGUS PLANTS, 5s. per 100. LARGE GIANT SEAKALE PLANTS, 8s. per 100.
At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

DOUBLE ITALIAN TUBEROSE ROOTS.—The Bulbs of this most beautiful and fragrant Flower have been just received from Italy, at A. COBBETT'S Old-established Italian Warehouse, 18, Pall-mall; they are warranted double, and large and choice roots of which are selected at 4s. per dozen. N.B.—Orders by post punctually attended to.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem ... ... ... ... ... | 42s. to 60s. |
| Extra superior selected Standards ... ... ... | 18s. to 24s. |
| Fine Dwarfs and Dwarf Standards ... ... ... | 10s. to 16s. |

| Good do. do. without names, per 100 | 30s. |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. WILLIAM BEAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. WILLIAM BEAILSFORD, who, upon their receipt, will return an order upon Mr. RIVERS for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

## GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN SEED ESTABLISHMENT,

**For Supplying Genuine Home-Grown Seeds Carriage Free.**

JOHN SUTTON AND SONS, SEED-GROWERS, Reading, Berks, being extensive Growers of Seeds, and having many Customers in the Southern, Midland, and Western Counties of England, and in South Wales, have made arrangements with the Directors of the above named Railways (all of which converge at Reading), whereby they are enabled to deliver their Goods *Carriage Free* to any Station on either of these Lines; or to any Railway Terminus in London; or Packet Office in London or Bristol.

SUTTON'S NEW PRICED CATALOGUE OF HOME-GROWN SEEDS, being a careful selection of only the very best kinds of KITCHEN GARDEN, AGRICULTURAL and FLOWER SEEDS, *with prices affixed to each article*, will, it is presumed, be found the *most useful* and convenient of any yet presented to the public, the prices being remarkably low, while the sorts are the best in cultivation. *It will be sent post paid on application, enclosing one penny stamp.*

### SUTTON'S COLLECTIONS OF GARDEN SEEDS.

*For the convenience of Gentlemen who may not be well-acquainted with all the best kinds of Garden Seeds, and the proper proportions of each generally necessary to stock a large or small Garden*, Messrs. SUTTON *have during the last seven years been in the practice of making complete Collections for one year's supply, the economy and other advantages of which system have been fully appreciated by the purchasers, as indicated by numerous recommendations and annual increase of orders.*

The Collections are increased in quantity this year, and are far superior to any others yet offered to the public, both in quantity and quality.

| | £ | s. | d. |
|---|---|---|---|
| No. 1. A COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS FOR A LARGE GARDEN, for one year's supply | 2 | 10 | 0 |
| No. 2. A COMPLETE COLLECTION OF DITTO, in quantities proportionately reduced ... ... ... ... ... | 1 | 10 | 0 |

☞ London Agents: Messrs. HURST and M'MULLEN, 6, Leadenhall-street.—Danecroft Nurseries, Stowmarket.

DALSTON NURSERY, MIDDLESEX.—All Persons having Claims against the Estate of Mr. JOHN SMITH, late of Dalston Nursery, deceased, are requested to forward the particulars thereof, addressed to Mr. THOMAS SMITH, at the Nursery, without delay; and all Persons Indebted to the Estate are requested to pay the same either to Messrs. GRAHAM and LOYDE, Solicitors, 3, Mitre-court Chambers, Temple, London; or to Mr. WILLIAM HARRINGTON, at the Nursery.

TO THE READERS OF THE "MIDLAND FLORIST."

TESTIMONIAL TO MR. WOOD.—At a recent private meeting of friends, at Mr. Dodwell's, the subject of the *Midland Florist*, and the long and honourable service of its Editor, was introduced; and it was suggested, that the great meeting, to be held in May next, offered a most appropriate opportunity to present to Mr. WOOD a Testimonial, expressive of the esteem and cordial regard his conduct as a man, and his long and eminent service in the cause of Floriculture, had engendered; and it was unanimously determined that measures should instantly be taken in furtherance of this object. In the first instance this notice was not contemplated, but it was quickly felt that to keep the subject private must lead to the exclusion of the large body of Florists. Mr. WOOD was therefore informed of the purpose, and excepting that he distinctly refuses to receive a money gift, he appreciates the feeling displayed.

Florists of England! of the whole world! it is no part of the purpose of the writer of this to eulogise the services of Mr. WOOD; those services must have been, and be now felt, or this notice will fall a dead letter on your hearts. Those services have been many and various, freely and with honour rendered, wherever needed; and it is not of the least, when, despite the sacrifice as a professional Florist, he has cheerfully rendered you his aid at your great meetings. Come forward, then, and render honour to him who has honoured you; who has given you a place and a name of honour amongst the nations. Let all classes take the work to their hearts, the humblest as well as the most elevated; and that all may join in an act of graceful homage to high worth, Subscriptions, however small, will be received by any of the following gentlemen:—Edward Beck, Esq., Worton Cottage, Isleworth; John Edwards, Esq., Wace Cottage, Holloway; Mr. Charles Turner, Royal Nursery, Slough; Mr. R. Marris and Mr. F. W. Hollyoake, Leicester; Samuel Buswell, Esq. and Mr. I. C. Wasnidge, Nottingham; Thomas Adams, Esq., Derby; John Haines, Esq., Tiptou; Mr. Henry Pope, Birmingham; Mr. R. Dixon, Manchester; G. W. Hardy, Esq., Warrington; Mr. Rhodes, Mr. Dobbins, Mr. Bramma, and Mr. Schofield, Leeds; M. Woodhouse, Esq., Whitby; Mr. Hepton and Mr. Merryweather, York; Mr. G. Lightbody, Falkirk; and Mr. E. S. Dodwell, Derby.

All communications are requested to be addressed to Mr. E. S. DODWELL.

The following Donations are announced:

TO GENTLEMEN, GARDENERS, AND OTHERS.

ORANGE AND LEMON TREES.—Any private grower having four Orange and two Lemon Trees to dispose of, 8 or 10 feet in height, with clean stems, good heads, and in a healthy condition (by stating price), may hear of a purchaser by applying to Mr. ROBERTS, Gardener, Raby Castle.
Raby Castle, Darlington, Jan. 18.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, &c., may be obtained gratis on application. It describes the colour of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections. He has many thousands of Rhododendron ponticum in sizes very suitable for planting immediately into Game Preserves, very healthy bushy stuff, price 5l., 7l. 10s., and 10l. per 1000.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway, and three miles from Blackwater, South-Eastern Railway.

WM. HAMILTON, SEEDSMAN, &c., 156, CHEAPSIDE, LONDON, begs to intimate that his Catalogue of Seeds, &c., will be sent by post on application. It contains, as usual, in the most comprehensive style, the ENGLISH AND SCIENTIFIC NAME, HABIT, AND DURATION, TIME OF SOWING AND FLOWERING, THE COLOUR, &c., of upwards of 500 of the most popular Flowers, with prices of Vegetables, Plants, Implements, &c. Everything connected with Gardening at the lowest prices consistent with a good article.—Address, 156, Cheapside, London.

HERACLEUM GIGANTEUM.

HERACLEUM GIGANTEUM AND HERACLEUM SPHONDYLIUM; sow this and next month. The former is one of the finest ornamental biennials in the world; grows 12 to 14 feet high; leaves, 5 feet wide; pure white umbellated flowers, 2 to 3 feet in diameter; a native of Siberia. The latter is a British plant, much improved by cultivation, producing abundance of green food for cattle, pigs, and rabbits, which fatten upon it. Seeds of either variety 6d. per packet, post free, with directions for sowing, &c. A liberal allowance to Seedsmen.
ABRAHAM HARDY and SON, Seed Growers, Maldon, Essex.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE OF SEEDS is now ready, being a part of their ANNUAL SEED AND PLANT LIST, which will shortly be complete, and forwarded as a newspaper, free by post. The Parts now ready may be had together for a penny stamp, viz.:

PART I. FLOWER SEEDS, containing a scale of priced selections of 422 of the new and most approved sorts, with colour, height, hardiness, duration, price of each packet, and other useful information.

PART II. VEGETABLE SEEDS, with priced scale of collections, time of sowing each description of Vegetable, and price of each variety, with heights of Peas, and other descriptive information.

PART III. AGRICULTURAL SEEDS, containing also much useful and descriptive information.

PART IV. ROOTS, FRUITS, AND BULBS for early planting.

PART V., as far as complete, contains a scale of prices of our choice selections of plants, and the principal part of our descriptive list of Geraniums.
Seed and Horticultural Establishment, Sudbury, Suffolk.

THE REGISTERED ROSE GIRDLE-LABEL.—A Rose Grower (having found, by long experience, the present method of securing Standard Plants by wires of any kind, and cord or rope of whatever description, to be highly injurious to the bark, and otherwise detrimental to the growth of the plant, besides being clumsy, troublesome, and ineffectual), has the pleasure of submitting to Amateurs and the Public a new Invention which he has recently introduced, for the more efficient and neat fastening of Roses and other Standard Plants to their Stakes.

The REGISTERED ROSE GIRDLE now offered to the Public, besides the advantage of being well adapted for a neat and permanent Label to the plant which it secures, will greatly diminish the time and trouble attending the mode hitherto pursued in the tying of Standard Plants to their stakes. The utility of this invention, while combining two important objects (till now very imperfectly attained), cannot but entitle it, from those who wish a neat and permanent Label as well as an efficient fastener for their Standard Plants, to an additional claim. It is neat as it is efficacious, and as cheap as it is useful.

EXTRACT FROM "FLORIST'S DIRECTORY."—"We consider it one of the most useful articles that have been invented—it forms a permanent Label as well as an unerring fastening, and we shall be disappointed if it is not generally used for Roses and Standard Cytisuses. We shall adopt it for everything we can apply it to in the garden."

Sold, wholesale and retail, by WILLIAM HAMILTON, Seedsman and Florist, 156, Cheapside, London; and to be had of all Nursery and Seedsmen. Price 1s. 6d. per dozen.

THE NEW EARLY SWEET-KERNELLED KAISHA APRICOT.

MESSRS. VEITCH AND SON feel much confidence in bringing into public notice the above valuable new Syrian Apricot, sent to this country by the late JOHN BARKER, Esq., of Suedia, the gentleman by whom the valuable Stanwick Nectarine was introduced. Having obtained the entire Stock, they are now prepared to send out a limited number of healthy Young Trees at the following prices, and solicit the favour of early orders, which will ensure good trees and meet with immediate attention:

Healthy one year old Trees ... 21s. 0d.
„ one year trained ... 31 6 } package included.
„ two year trained ... 42 0 }
A few two year old trained, chiefly half standards and standards ... ... ... ... 42s. each.

One plant over to the Trade when three are taken.

In offering the above valuable new early Apricot for sale, Messrs. VEITCH and SON beg to refer to the description given by Dr. LINDLEY, in the "Journal of the London Horticultural Society" for July, 1849, from which the following extract is given:

"The fruit semi-transparent, roundish 5½ inches, in circumference, skin slightly downy, pale citron-coloured where shaded, tinged and marked with red next the sun. Flesh tender, juicy, of a clear citron colour, parting freely from the stone, *sugary and delicious*, like well refined lump sugar combined with Apricot flavour; stone *small*, roundish; kernel sweet like a nut. A valuable early variety for the dessert, and probably excellent for preserving; if it be employed for this purpose, the transparency of its flesh will exhibit a new feature amongst Apricot preserves. Some of the fruits have ripened as early as the 12th of July, and on the *same wall* at the time were Moorpark and Turkey Apricots perfectly green and hard."

Exeter, Jan. 1851.

CUCUMBER—"PHENOMENA."

EDWARD TILEY begs to offer to Cucumber-growers generally the above superb CUCUMBER, which he feels confident will give the greatest satisfaction to them, as did the former kinds sent out by him during the last seven years, being Victory of Bath, Gordon's White Spine, and Lord Keynon's Favourite.

The above splendid Cucumber, "Phenomena," was a hybrid between Hamilton's Black Spine and Mills's Jewess, which it surpasses, both for its prolific qualities and length of fruit, generally growing from 22 to 28 inches. It is a beautiful black spine, of a dark green colour, and free from ribs or shrivels; it also grows quickly, carries its bloom well, and will be found first-rate for exhibition. As a proof of its prolific qualities and length, the following may be vouched for, viz.:—There were cut from two plants, grown in a one-light box, the size of which was 4 feet by 6, 24 brace of Cucumbers, each fruit averaging 22 inches long—total length of the whole amounting to 29 yards 1 foot. It is solid, and eats very crisp. Sold in packets containing seven seeds, 5s.; or three seeds, 2s. 6d.

E. T. has also seed of his three other superb Cucumbers at the following prices:

Victory of Bath, per packet ... ... ... 2s 0d.
Gordon's White Spine, ditto ... ... ... 1 6
Lord Keynon's Favourite, ditto ... ... 2 6

This last is the best for winter cultivation.

MELONS.

BROMHAM HALL GREEN-FLESH MELON.—This has again this season surpassed all others for its superior flavour; it was placed first and second for flavour at the Chiswick Exhibition last season, and obtained a great number of first prizes throughout the country where exhibited. Sold in packets at 1s. 6d. each.

E. T. has also seeds of the following superb Melons, which he can with confidence recommend:

| | 1s. 0d. per packet |
|---|---|
| Camerton Court Green-flesh ... ... | |
| Queen Melon ... ... ... ... ... | 1 0 „ |
| Blackall's Green-flesh ... ... ... | 1 0 „ |
| Bailey's Green-flesh... ... ... ... | 1 0 „ |
| Bowood Green-flesh... ... ... ... | 1 0 „ |
| Beechwood Green-flesh ... ... ... | 1 0 „ |
| Windsor Prize ditto... ... ... ... | 1 0 „ |
| Emperor ... ... ... ... ... | 1 0 „ |
| Fleming's Trentham Hybrid ... ... | 1 0 „ |
| Duncan's Green-flesh do. Improved ... | 1 0 „ |
| Hampton Court Green-flesh ... ... | 1 0 „ |
| Egyptian do. do. Improved ... ... | 1 0 „ |

Any quantity of the above will be sent postage free to any part on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

FOR CHEAPNESS, QUALITY, DISPLAY, and UTILITY, *the following are strongly recommended.*

HOLLYHOCKS, No. 1, fine double named kinds, all shades of colour, per doz., 9s., or per 100, 2l. 10s. HOLLYHOCKS, No. 2, for border display, very good, per doz., 6s., or per 100, 1l. 10s. These are selected from some hundreds of seedlings, and may be confidently relied on.

HERBACEOUS PLANTS.—Purchaser's Selection, from List, per 100, 3l. 3s.

W. MAY's selection, extra fine, No. 1, 2l. 2s. per 100;
„ „ really good, No. 2, 1l 10s. „

Having an immense stock they can be furnished at these low prices. The collection extends over 700 species and varieties selected from the choicest stocks in the country (regardless of expense) for display, and warranted second to none. To meet our customers in every way, we hope to be favoured with lists of such plants as are already in their collections, that duplicates of any article may not be sent where the selections are left to ourselves.

FLOWERING SHRUBS AND ORNAMENTAL TREES.—The finest vars., purchaser's selection, from the list, per 100, 3l 3s.

W. MAY's selection, No. 1, extra fine, per 100, 2l. 2s.
„ „ No. 2, good kinds, „ 1l. 5s.

This Nursery has long held high celebrity for possessing a most splendid stock of flowering shrubs, extending over upwards of 600 species and varieties of the choicest kinds. Some hundreds were selected by Mr. E. KEMP for the Park at Birkenhead; and for correctness of naming, quality, and health, not excelled by any.

To gentlemen forming Arboretums, or making extensive Ornamental Shrubberies, this is an opportunity seldom offered.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4l.; or per 100, 10s., fine healthy stuff; 2 to 3 feet, bushy, extra fine, per 1000, 5l.—per 100, 15s.

GOOSEBERRIES, all the finest Lancashire show sorts, per 1000, 4l., in 100 varieties, or per 100, 10s., in 50 varieties; the stock extends over 30,000, and is very fine and healthy.

CURRANTS—White, Red, and Black, including Black Naples, per 100, 10s., fine.

Fruit and Forest Trees, fine, and equally low, and of the most approved kinds, warranted true.

Kitchen and Flower-garden Seeds, of the best quality, very cheap.

Greenhouse and Stove Plants, a splendid stock, at low prices. Catalogues on application gratis.

Orders (except for Forest Trees), above 5l., will be delivered carriage free, or allowed to London or within 150 miles of the Nurseries.—Address, WILLIAM MAY, Hope Nurseries, Leeming-lane, Bedale, Yorkshire. Post-office orders should be made payable on Bedale, to JOHN MAY.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2½ feet, is three weeks earlier than the old dwarf Green Knight's, and the Peas and pods are twice the size. 5s. per quart.

BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetars, and 20 to 24 per stem. 1s. per quart.

BURBIDGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1s. per quart.

The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c., Wholesale and Retail, 109, St. Martin's-lane, Charing-cross, London.

Catalogues can be furnished on application.

CHOICE FRUITS, &c.—Planters are respectfully informed that YOUELL and Co. possess an extensive stock of strong and healthy plants of the under-mentioned:

FASTOLFF RASPBERRY (true), as originally sent out by Youell and Co., 15s. per 100.
Large White do., 24s per 100.
Cornwall's Victoria, 8s. per 100.
CURRANTS.—Improved large White Dutch, 5s. per dozen.
Large Black Naples, 6s. per dozen.
Raby Castle, or Victoria (red), 6s. per dozen.
Knight's Sweet Red, 6s per dozen.
Knight's Large Red 6s. per dozen.
Red Grape, 4s. per dozen.
GOOSEBERRIES of the finest sorts, by name, selected for size, combined with flavour, 5s. per dozen.
RHUBARB.—Myatt's Linnæus, Mitchell's Royal Albert, and Myatt's Victoria, 12s. per dozen.
Youell's Tobolsk, fine, for forcing, 6s. to 9s. per dozen.
ASPARAGUS.—Giant, strong, 4 years old, for forcing, 5s. per 100.
Do. do. 2 and 3 years old, 2s. 6d. and 3s. 6d. per 100.
SEAKALE, strong, 1s. 6d. per dozen.

Apples, Pears, Cherries, Plums, Peaches, Nectarines, and Apricots, of the newest and most approved kinds, selected from the Garden of the London Horticultural Society, and warranted true to name, can be supplied in maiden and trained trees of the finest quality, and forward for bearing.

TO PLANTERS AND CONTRACTORS.—WHITETHORN, twice transplanted (very strong), 7s. 6d. per 1000.
Do. 1 and 2 years transplanted, 4s. 6d. and 5s 6d. per 1000.
Do. 4 years, strong and fine, with an abundance of fibrous roots, as good as transplanted, 3s. per 1000, or 12l. 10s. per 100,000.

YOUELL and Co. can also supply
CAMELLIAS, of the newest and best kinds, with flower-buds, 30s. per dozen.
ROSES, standard, half-standard, and dwarfs, of the very best kinds in cultivation, 12s to 15s. per dozen.
ESCALLONIA MACRANTHA, 5s each.
Royal Nursery, Great Yarmouth.

CLEANLINESS, says some old writer, is the charm of animated beings; but we suspect that plants were not included in the maxim. People, indeed, seem to have no notion that because they must clean their own skin, if they would preserve their good looks, therefore they must clean the skin of the creatures that surround them. It must be confessed, indeed, that cleanliness would seem, from the practice of many persons, to be looked upon as the peculiar attribute of man. The state of their cows and their pigs and their oxen plainly enough declares a conviction that dirt is the heritage of all living things, man excepted. To introduce the sponge and the curry-comb into the pigstye and cowshed is a degree of rural dandyism of which, they think, no rational being would be guilty. How much stronger then must be the belief that to plants, the peculiar children of the soil, dirt must be natural, if not necessary.

And yet we find, in the condition of the plants in some good gardens, a degree of neatness observable which our forefathers thought, with many of their descendants, to be wholly uncalled-for. But we fear that, even here it is not uncommonly supposed that the chief ground for keeping plants clean is that their colours are brighter, and that they harmonise better with the woodwork and floors, in which neatness is required by common consent. It may be too that in greenhouses the fair hands that gather flowers are not to be soiled with impunity because of a gardener's neglect.

If these reasons were the only ones for keeping plants scrupulously clean, they would be weighty enough to demand attention; but they are among the weakest. It is notorious to those, who understand the nature of vegetable life, that a freedom from impurities upon the skin is of even greater vital importance to a plant than to a man. It is nearly ten years since we showed, in these columns, that the main reason why green leaves and gay flowers are banished from the squares and balconies of London, is the filthy atmosphere that is incessantly defiling them; and we then asserted, what few believed to be true, that if as much washing were bestowed in London upon a pet plant, as upon a lapdog, the one would remain in as good condition as the other. The reasons are obvious. Plants breathe by their leaves: and if their surface is clogged by dirt of whatever kind, their breathing is impeded or prevented. Plants perspire by their leaves; and dirt prevents their perspiration. Plants feed by their leaves, and dirt prevents their feeding. So that breathing, perspiration, and food, are fatally interrupted by the accumulation of foreign matters upon leaves. Let any one, after reading this, cast an eye upon the state of plants in sitting-rooms, or ill-kept greenhouses; let them draw a white handkerchief over the surface of such plants, or a piece of smooth white leather, if they desire to know how far they are from being as clean as their nature requires.

There is so little novelty in all this, although but seldom thought of, that we should have scarcely introduced the subject, if it were not for some new and curious experiments just published by M. GARREAU. This experimentalist has for some time devoted himself to inquiring into the functions of the skin of plants, and his observations entirely confirm all that had been stated upon the subject by others. Among other things he found that soap and water had great merit; plants well washed acquiring a power of absorption much beyond what they possessed in their unwashed condition. Thus the rate of absorption in the Tangiers Ferula was as 4 to 0 after ablution; and in the yellow Gentian as 30 to 20. In like manner, the petals of the Pæony took up five and six times as much after as before being cleaned; and the leaves of the Lilac, Lily of the Valley, Ivy, and Clematis when washed took up about twice as much as before.

It is not a little curious, however, that soap and water had a far greater cleaning effect than mere water; thus, a Fig-leaf, which had been lathered, absorbed 90 parts, while after a mere water-bath it took up only half the quantity; and a bramble, which soap and water provided with 130 parts of water absorbed, could only consume 10 parts when cleaned with water alone. Can there be a more conclusive argument in favour of the repeal of the soap duty? We respectfully submit this to the consideration of the Chancellor of the Exchequer.

On a future occasion we shall lay before our readers, in a more formal manner, the results to which M. GARREAU's experiments have led him. In the meanwhile enough has been said to show that a dirty gardener is necessarily a very bad one, as well as a particularly disagreeable person.

THE ORCHARD HOUSES, to which we alluded last week, have been proposed by Mr. RIVERS as a certain and unexpensive means of securing a crop of common fruit. Considering the fickleness of our springs, the universal loss of a considerable portion of all orchard crops by late frosts, especially in low warm situations, and the slight amount of protection by which such consequences are to be averted, it must be owned that an intelligent enterprising nation like this has been untrue to itself in not having sooner thought upon some simple means of security. No doubt the evils have been borne under the idea that they can only be averted by an expenditure which the value of the article to be preserved would not justify.

It must be admitted that there was much truth in this so long as timber and glass and iron-castings were dear, and more especially so long as no other mode of obtaining protection was known than that of building costly hot-houses and greenhouses. But all this has ceased. Glass is among the cheapest of materials. Timber is sunk to its lowest in price; saw-mills have reduced the labour of its conversion to a comparatively inconsiderable sum; and iron-castings may be had at five or six pounds a ton. With these materials skilfully applied the expense of covering large areas becomes in many cases a prudent outlay; for markets must be bad indeed if they will not yield a profit to the producer of crops under such glass roofs as we are alluding to, after allowing an ample margin for interest upon the expense of constructing them.

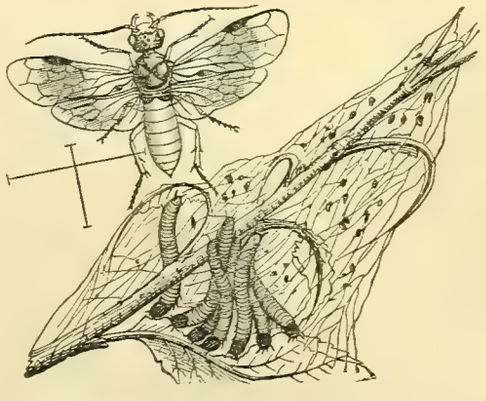
Mr. RIVERS points out in what manner he would set about this in a very useful pamphlet,* which we advise everybody to purchase. Having been published for the purpose of aiding in the repairs of his dilapidated parish church, his little treatise has a claim upon the public, independent of its intrinsic horticultural worth, which is great. After pointing out the important fact, that the mere covering a space of ground with a glass roof is sufficient, without fire heat, to produce in England the climate of central France, Mr. RIVERS explains in what way he constructs—for he teaches what he

* The Orchard House; or, the Cultivation of Fruit Trees in Pots under Glass. By THOMAS RIVERS, of the Nurseries, Sawbridgeworth, Herts. LONGMAN & Co.

has done, not what he thinks might be done—at a very small expense, the building to which he gives the name of an Orchard House.

"I have," he says, "a house 30 feet long, built as I have described, with a brick Arnott's stove in the centre of the back border, which is excavated for it to a level with the sunken path: everything thrives admirably. The borders are 12 inches deep, with lime rubbish mixed with a little manure: my forced Strawberries, placed on the front border near the glass, rooted into it, and gave me abundance of excellent fruit. In like manner, Peaches, Grapes, Figs, and Apricots, may be forced with but little trouble,—in fact with much pleasure and gratification. But in building these *forcing* orchard houses the *constant* ventilation through the cracks in the boards must be avoided; they must be cased with asphalte felt, or, as bricks are cheap, the walls may be of brick, with the ventilating shutters in back and front. The forcing orchard house I have alluded to above, is built with studs of Larch cut once down, and covered with half-inch boards; these being nailed on, were well tarred with Stockholm tar, and the felt (M'Neil's) then nailed on, and done over twice or thrice with boiling coal tar, in which lime that had been slaked a fortnight was mixed to the consistency of thick paint: this forms a shining, imperishable, mineral coat,—I know of nothing equal to it for felt, clay, or lime walls or fences; my clay walls on some old buildings have, by repeatedly using it, become coated with stone. I have mentioned that bricks may be used; but although I have many plant houses built with bricks, I have not employed them for building orchard houses, or even houses for forcing Roses, &c. My preference for boards and felt for forcing houses may be owing to imagination; but I may as well state *why* I have and do prefer them;—it is because I have found them fiercely hot during the day, even in moderate sunshine, the evil effects of which are easily modified by abundant ventilation, and agreeably cool during the night, without that stifling atmosphere peculiar to houses with brick walls, only because bricks give out heat for many hours after sunset. Now in thus rapidly cooling down, I have found that they approximated to the descriptions given of the climate of the East, the birthplace of all our choice fruits; accordingly, my Peaches, Nectarines, Grapes, and Figs, have grown and do grow with as little trouble as I can wish them, in houses with their walls of half-inch boards and felt. But I ought not to omit mentioning here an additional reason for my opinion that fierce sunlight through large pieces of glass and abundant ventilation, will give us the climate of continental Europe. I have an orchard house, 90 feet long, 12 feet wide, rafters 4 inches by 2 and 14 feet long, the back wall of which is a fine Beech hedge, 20 years old, 8 feet high, 1½ thick, the front half-inch boards; the board next the glass 15 inches wide, is on hinges, and is always open in warm weather: this house is glazed with 16-oz. sheet glass, 20 inches by 12, placed crosswise, so that the rafters are 20 inches apart; the glass is foreign, of the cheapest description, and cost 2¼*d.* per foot. Under ordinary circumstances I should have much trouble from scorching, as it is very irregular, and many foci are formed; but the gentle percolation of the air through the hedge is so constant and so regular, that not a scorched leaf is to be found in this orchard house, in which are about 700 Peaches, Nectarines, Apricots, and Figs in pots, a few Pears full of fruit, a few Plums, the same—everything is in perfect health, the shoots of the Peaches and Nectarines in particular are beautifully ripened. Now what can tell more forcibly that scorching is the result of imperfect ventilation?"

The cost of such houses may be judged of from the whole expense of one 21 feet long, 12 feet 6 inches wide, 2 feet 9 inches high in front, and 7 feet 6 inches at the back, being 17*l.* 8*s.* 9*d.*, or less than 1*s.* 6*d.* per foot superficial of the area covered. The pamphlet contains a plan of such a house, and a detailed statement of the manner in which the cost is made out.



Within houses of this kind Mr. Rivers grows, with great success, Apricots, Peaches and Nectarines, Plums, Cherries, Figs, Pears, Grapes, Apples, Strawberries, &c., all in pots, by a system of management fully and carefully described in his pages. We say in pots, because it is important to bear in mind that in places of such small dimensions fruit trees must necessarily outgrow the space allottable to them, unless their roots are confined in pots. His experience has told him that if planted in the ground "they cannot be kept under control, even with annual root-pruning. I have some Peach-trees which have been planted in the raised borders of one of my orchard houses four years; they bear admirably; but, in spite of root-pruning, they will grow too rapidly. Now, in pots, the size and growth of the tree may be regulated with the greatest nicety; the annual root-pruning can be done with much facility, and there is no occasion to dig and disturb the borders, which must be done to a great extent to root-prune properly, trees planted in them. In fine, as far as my experience has gone, I can imagine nothing so eligible as pots, or vases, for fruit-trees in orchard houses, or fruit conservatories."

But although this is true in small places, it would by no means apply to "Victoria Houses," under which, ventilation being provided, cultivation would go on exactly as it does in the open ground; and all the trouble and expense of pots be saved. We see no reason whatever why many of the walled-in squares of the kitchen gardens attached to country residences should not be covered with glass; the walls remaining as they are. In that way the great expense of side enclosures would be saved; and it would become possible to rely upon the certainty of many crops which are now almost the result of chance. Winter Lettuces ought to grow there, as they now grow in summer; early Peas and Beans would beat those now poured into our markets from the south; Manchester would have the climate of Penzance, and Isleworth of Jersey; and for anything we see to the contrary, the differences of climate between Provence and Middlesex would cease to exist. The whole difficulty consists in ventilation; that is to say, in maintaining beneath the glass roofs such a motion of the air as would resemble that to which plants are naturally exposed. Such a movement of the atmosphere is indispensable; and we shall be greatly surprised if the engineers of this country do not provide it in a manner to leave nothing to be desired.

## ENTOMOLOGY.

### The Pear-tree Lyda.

The genus Lyda is one of the most interesting of all the groups of saw-flies (Tenthredinidæ), a family of Hymenopterous insects, so named from the saw-like apparatus at the extremity of the body of the females, which is employed in forming small channels in the stems or leaves of plants, within which the insect subsequently deposits her eggs. Not only do the perfect insects of this genus (Lyda) differ from all the other species of the family in their very large wings and their long multiarticulate antennæ, gradually attenuated to the tip, but the larvæ are quite unlike those of all the other genera, since, instead of having numerous pairs of fleshy legs attached to the middle and posterior segments of the body, as is the case with the larvæ of the ordinary Tenthredinidæ (which thus bear the closest possible resemblance to the caterpillars of butterflies and moths), the larvæ of the Lydæ are only furnished with the three pairs of short, ordinary, jointed feet attached to the first three segments succeeding the head, and the body is terminated by two short points, beneath which are two longer articulated appendages, resembling the thoracic legs, but directed backwards, whence the motions of these larvæ are curious, and quite unlike those of the other species, which are furnished with abdominal prolegs, having more of a sliding motion, and employing their powers of spinning silk, far assisting their progress. When they descend from a leaf, they let themselves down by a silken thread, after the manner of caterpillars.

There is considerable diversity of habit in the different species of the genus; and some of the species are very destructive to different kinds of Fir-trees. Hartig and Ratzeburg have figured the history of various of these Fir-feeding species in their excellent works. Most of the species live in society, but others are solitary in their habits, as is the case with the larvæ of the Lyda inanita, whose history I have given in our volume for 1847, p. 684, which feed upon the leaves of standard Roses, which they separately roll up into spiral tubes, in which they reside.

Amongst the social species are several which feed upon the Pear *, one of which I have had the good fortune to trace to its final state, and thereby to discover that one of the rarest British species of the genus may be obtained in our suburban gardens, if entomologists will only take the trouble of endeavouring to rear the caterpillar, or of carefully examining the trees, at the period when the perfect insects appear.

At the beginning of the month of July, 1848, and again in the two following years, I observed that several young espalier Pear trees in my garden at Hammersmith were attacked by a number of orange-coloured larvæ residing in society beneath a silken web, which they spin around the young branches and leaves of the trees, which they quickly defoliate, leaving only the midrib of the leaves, and then making their way to an adjacent twig. The largest individuals were about an inch long, nearly cylindrical, bright orange-coloured, with a black head. There were also others of a smaller size, but they were similarly formed and coloured, and were doubtless younger specimens of the same species. (This is mentioned, because in some of the species there is considerable diversity in the colours of the larvæ of different ages.) When alarmed, these larvæ withdraw about a quarter of an inch within the web, remaining quite stationary, each ejecting a drop of dark-brown fluid out of the mouth as a means of defence. This was the more necessary, as I observed some of the parasitic Muscidæ hovering over them, evidently with the view of depositing their eggs in their bodies.

As represented in our little annexed figure, it will be seen that having commenced at the top of a twig they descend, conjointly attacking a fresh leaf. The little dark particles observed lodged in the web, are the excrement of the larvæ. When disturbed the larger sized individuals let themselves down to the earth, within which they immediately buried themselves, which at once let me into the secret of the place in which they undergo their transformations, and enabled me to foresee that if I knew the precise period in the following year when they arrive at the perfect state, I had only to watch the trees, and I should then find the perfect insects. I also endeavoured to obtain the same result by placing some of the larvæ in a large garden pot filled with earth, but I had scarcely better success than Reaumur, who seems also to have been acquainted with the larvæ of this species (Mémoires, vol. iv., Mem. 4. pl. 15, figs. 7, 9, 10), and who says that by keeping the earth dry, the larvæ dried up, and by keeping it damp, they became mouldy. One of my specimens, however, did not die until it had nearly arrived at the perfect state, the form and colour of the perfect insect being attained, although the limbs were still encased in the thin membranous covering of the pupa, and the wings, consequently, not being extended, but lying in a small crumpled mass at each side of the body. I had thus, however, obtained sufficient knowledge of the perfect state to be able to assert that the perfect insects which I detected upon my Pear trees in the last week of May, 1850 (one of which I also saw crawling out of the earth), were the descendants of the insects I had first observed in the larva state in July, 1848, and which had themselves arrived at the perfect state in May, 1849, without my having noticed them, although I paid many visits to the trees at that period, knowing that it was the precise time that the Lyda inanita arrives at the perfect state. I have not, it is true, found the pupa of these insects, but this, under the circumstances, is an unimportant link in the history of the species, as it would resemble the perfect insect in size and shape, only differing in fact by having the legs and antennæ lying encased in delicate membranes along the breast and belly, and the wings enveloped in the membranous wing-cases resting at the sides of the body.

The perfect insect proves to be the very rare Lyda fasciata (Curtis Brit. Entomology, pl. 331), a species which appears unknown on the Continent, and of which the female alone has hitherto been known. This sex, which is figured by Mr. Curtis (who did not possess the species), measures about half an inch in length, and an inch in the expansion of the wings. It is of a black colour, with a yellow patch between the antennæ; the base of the latter, the mandibles, the scales in front of the wings, and the legs yellow, and the terminal half of the abdomen orange-red; the fore wings have a broad dusky band crossing them rather beyond the middle, and the apical half of the hind wings is also dusky. The male, hitherto undescribed, and which is here for the first time figured, is coloured in the same manner as the female, differing, however, in having the entire front of the head pale yellow, and in having the whole of the abdomen of an orange yellow. It is also somewhat smaller than the female. The males seem rarer than the females, and those which I captured were not observed until several days after the females had begun to appear. *J. O. W.*

* In my Introduction to the Modern Classification of Insects, vol. ii. p. 107, the larva of L hypotheupica of Hartig is by a misprint stated to feed upon the Pear instead of the Pine.

## BRITISH SONG BIRDS.

No. XIV.—As no workman, how clever soever he may be, can move one step in the right direction without being provided with proper tools,—so, no aviary can be reckoned "complete," in its several appointments, without *all* the necessary paraphernalia are in readiness to be used as occasion may require them. I shall therefore proceed, at once, to particularise what these essentials are.

In the first place,—as you will daily have to grate your bullocks' liver, buns, &c.; and as it requires a "fine" apparatus for this purpose; you must get a carpenter to furnish you with two well-seasoned deal boxes, made as follows:—The length of each box must be 8 inches; width, 6 inches; depth, 3½ inches. All round the tops of each, should be ledges; shelving upwards and outwards, so as to prevent waste. In the upper part of each box, let a square sheet of tin be inserted (any

brazier will undertake this), perforated with minutely-fine holes, and strongly "roughed" on the outside, like an ordinary domestic grater.

In the under part of each box, let a drawer be fitted, to pull out; having a ring in the centre. By the aid of this, you will obtain easy access to whatever you may have been passing through the holes above. One of these boxes should be kept exclusively for the bullocks' liver, and cleansed immediately after use; the other, for the buns, bread, &c. This provision has reference to the "warblers" principally. The larger and more hardy birds will select tangible pieces of bread, bun, &c.; which they love to place under their claw, and flirt with at their leisure.

You must next provide a piece of deal, 12 inches square, and made on the principle of what housekeepers call a chopping-board; that is, having a back to it, and a narrow "wall" on each side. On this you must place your Hemp-seed, crushing it thoroughly with a *lignum vitæ* rolling-pin. After every operation of this kind, scrape the board clean with a long knife; and daily scald it with boiling water, to remove or lessen the grease which has exuded from the Hemp-seed.

A pestle and mortar, of marble, is the next requisite. This is serviceable for rubbing down the hard-boiled eggs, and a variety of other substances connected with an aviary. It is an article of indispensable utility. To scrape your raw beef on, and keep it free from taint, you will find nothing so serviceable, nothing so appropriate, as a circular slab of marble, 12 inches in diameter. This will be in perpetual use as a general "table for operations." In connection with it, you will find a "spatchelor," or apothecaries' knife, very handy. Being flexible, it yields easily to the pressure of the hand. Both these articles must, of course, be kept sweet and clean.

To cleanse the floor of the aviary, by removing the sand, &c., the most ready instrument will be a kind of "hoe," fitted in a wooden handle, 12 inches long. The width of the hoe should be 5 inches, and it should be slightly "inclined" inwards. A trowel, also, on a somewhat similar principle, will be found useful, for scraping the *corners* of the floor. The sand should be, to use an Hibernicism, rather gravel than sand. That is, it should be gravel, finely sifted, so as to retain a number of small pebbles. These pebbles are freely eaten by, and greatly assist the digestive powers of, all the feathered tribe. It is not necessary to throw away all the sand every time it is removed; it will come into use again, much of it, when cleansed by sifting.

For this purpose, always be provided with two large strong sieves, made of wire, one finer than the other. Through these, severally, pass what is removed from the floor of the aviary, day by day. The *dry* sand will freely pass through the fine sieve—the residue must be rejected as being quite unfit for use. It will, however, do for the poultry-yard.

For the purpose of cleaning the circular and square perches, there are always kept ready for use (obtainable at any of the bird-dealers in the neighbourhood of "the Seven Dials") long and short iron rods, fitted with two distinct contrivances—one at either end. These are of light weight, and are made, at one end, so as to admit the perches into their centre. Thus, all dirt is readily removed, and with comparatively little trouble. These irons are also indispensable for the perches of *caged* birds, as well as those in an aviary.

The last equipment that I need notice is—the jars to contain your bird-seed, &c. These I should recommend to be of transparent glass, with glass covers also. The tall glasses, such as are used by chemists and confectioners, will be found most serviceable. Whether for your German paste, your buns, your seed—or what not—these glasses are to be highly commended. They are by no means costly, and they preserve all that is contained in them sweet and wholesome.

Of course, you will keep yourself well supplied with sponges, flannels, nail-brushes, and other similar articles of daily use. You should also be furnished with a stock of bird glasses, tin pans, &c., so as never to be at a loss, in case of sudden need. *William Kidd, New Road, Hammersmith.*

## GRAFTING.

No. III.—Analysis of the kinds of Grafting and Budding described in this Work.—As the modes which I propose to describe are chiefly intended for the propagation of plants, I shall only briefly notice those of grafting by approach, or inarching, by which sometimes useful and agreeable picturesque configurations are produced; but, in demonstrating those employed for propagation, I shall point out the operations applicable to the principal forms which amateurs may wish to produce.

I have included in one group all the kinds above mentioned, without confining myself to the various sections in which they have been classed by our great masters. Those by scions comprise the principal modes of cleft grafting, whether on branches or roots; and they are divided into two sections. The first treats of all thos; in which the stock is considerably larger than the scione the second, those in which the stock and scion are equal in size at the time of performing the operation. Crown grafting and side grafting belong to the same group.

Then we come to those which our great master has united under the denomination of budding (*greffe par gemma*). I shall only include such of them as are the most useful and most easily executed; as, firstly, some of the principal varieties of shield budding; and, secondly, those of flute budding. The numerous details which I am about to give on each of these modes will, I hope, be sufficient to enable my readers to propagate all the sorts of plants to which these modes are applicable.

Section I. General Observations on Inarching.—Inarching (*Greffe par Approche*) is distinguished from other kinds of grafting by the circumstance that both the individuals intended to be united live on their own roots, and mutually co-operate in forming a union. Such unions have different uses; they may be effected for permitting both individuals to live together during their united existence; or they may have for their object the transferring of valuable species to stocks of a hardier and more vigorous nature proper to maintain them independent of the parent plant, from which they are separated after they have taken on the stocks.

It is thus that we propagate many fine trees and shrubs which cannot be propagated by other modes, or at least not by any that are so well adapted for bringing plants rapidly to fruition. By means of some of the modes of inarching we can make our large trees assume, in our parks and forests, very agreeable and picturesque forms; and they may be made of more extensive utility for producing curved and angular timber, exceedingly useful for the navy, and in the arts.

The modes of inarching are very numerous. M. Thouin has described 39 of them. To demonstrate all these would carry me far beyond my present object. It appears to me sufficient to make known all those which may be most usefully turned to account, and practice will supply all the varieties which may be derived from them, and which have only received different names in consequence of their application to various positions and different stocks.

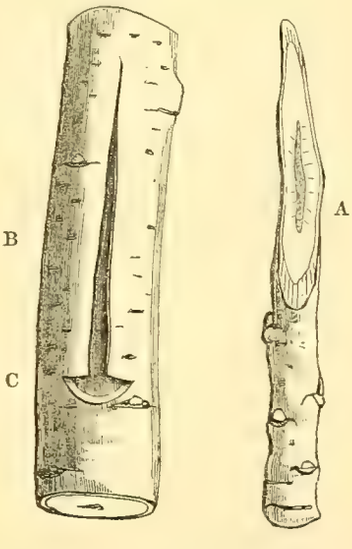


Fig. 1.

Inarching is best performed when the sap is in full flow in spring. All the modes of it require ligatures, and some little apparatus necessary for bringing the respective portions into the desired form; all these ought to be carefully looked after, in order to prevent strangulation and overstraining.

In stocks of high dimensions, destined to form curved timbers, &c., we should take care to allow some weak shoots and branches to grow along the stems, in order to increase their thickness; without, however, robbing the parts operated upon.

Inarching of Stems, for the purpose of supporting and invigorating them, see *fig.* 1. (This is a modification of that described by M. Thouin, under the denomination of Greffe Michaux.) *Operation.*—Select a strong tree, near which there is a slender one of the same kind, or if not, plant one, and when it is well established, bend it against the stem of the stock, in order to determine the most convenient place for the union; there cut off the top of the weaker, and thin the end like that of a flute, but more slanting, A; make in the bark of the stock, B, two incisions, which, together, form a T reversed, ⊥, at the bottom of which remove a small portion of bark, forming a semicircle, such as may be seen at C; then that above will be easily raised for introducing the extremity of the prepared portion, A, the cut surface of which will rest on the alburnum, and on which it should be immediately fixed, by means of stays and ligatures; and if the inarched tree, B, is large, and exposed to the action of the wind, the operation is secured by means of one or two nails, driven through the part joined, so as to afford the greatest resistance.* This inarching may be repeated on the same individual, when there are subjects adjoining that can be adapted. We may also apply it by bending the flexible branches of trees to their stems, and inserting their extremities in the manner above indicated. This application, and also the preceding, are very proper for forming bent timber for the purposes already mentioned. *Translated from the French of D' Albret.*

## MARKET GARDENING ROUND LONDON.

No. III. Cabbages.—These being general favourites with the public, their cultivation is extensively carried out by market-gardeners. Seed for the general crop of spring Cabbages is sown between the 25th of August and the 1st of September, in beds 5 feet wide, which collectively occupy several acres. Mr. Fitch, of Fulham, generally sows about 8 acres. When the plants are up, hoers are sent over the beds with 3-inch hoes; the plants are thinned out, and at the same time all deformed ones are removed. No particular time is set apart for transplanting; this entirely depends upon the season, and how other crops are got off the grounds. Last year Cabbage planting commenced about the 25th of October; the plants were then very large, and as the ground is dunged and trenched the planters follow the trenchers. I have frequently seen as many as 30 workmen upon one piece of ground, with their foreman walking along the line, in order to see that "every man did his duty," and it is his place to move the measuring sticks; for every man had his 12 feet measured out for him down the whole piece. The spades in use in market gardens are 12 inches long by 9 inches broad, and the work is performed by them in a masterly style. Land for Cabbages is heavily manured; a two-horse load is emptied down (as if it were a barrowful) for every 30 square feet. As soon as a four or five acre piece of ground is ready for planting, men with lines are put to work on it. The first line is trod out, and after it the rest 2 feet apart; the lines are then shifted crossways 2 feet distant, but this time the men only tread in the angle of the previously made line, so that the main crop stands 2 feet plant from plant; but, in case of a runaway, as well as to help to pay, a middle row is generally introduced; this row is, however, cleared off for Coleworts during this winter. I may mention that the existence of slugs is almost unknown in well managed market gardens; their disappearance is owing to the double trenching which is continually kept up in such gardens. Immediately after planting, hoes are sent through, to loosen the ground, and at all other favourable opportunities during winter and spring the earth is stirred and aerated; but the plants are never moulded up—a bad practice for almost any crop. Under the above system of treatment most delicious Cabbages are produced.

Cauliflowers.—The seed of spring Cauliflowers is generally sown about the 20th of September in open beds. Towards November, when the weather is beginning to get cold, frames and hooped beds are got ready in light rich land. The plants are pricked out, not more than 4 inches apart each way; during the winter they are kept dry; no rain is allowed to fall upon them; but whenever practicable plenty of air is given them, frost has but little effect on them under hoops; but when excluded long from air, and kept in darkness, they sometimes suffer from damp to a considerable extent. They are planted out in the richest and earliest ground in February, or the beginning of March. I have known one grower to save nearly all his Cauliflowers for seed, instead of sending them to market. In this way he has secured nearly a ton of seed from large plantations of many thousands. When the Cauliflower is permitted to seed the whole of the centre portion or flower is cut out except a rim to run up for seed. If this is not done the mass of flower is so great, that unless a very fine season occurs the seed will not ripen.

Celery.—For the first crop this is sown early in February; and in March and April for late crops. The first is sown either in a frame or under a hooped roof, with hot dung under it. Celery generally succeeds Cauliflowers, Cabbages, or Lettuces. The system is to dig out a trench two spades deep, banking the mould up on either side, then to fill in a foot of the strongest manure, such as cow-dung, and to cover this with 3 or 4 inches of mould for planting in; if the ground is very rich half the quantity of manure is applied, and it is dug in. The rows are generally from 4 to 6 feet apart, the plants are then taken from the seed-bed, and planted root and head entire—not trimmed in, a plan which ought to be discontinued in everything. The plants are placed about 8 inches apart, the intermediate ground being planted with Coleworts, Lettuce, or any other light crops which are likely to be off before the Celery wants moulding up; but market-gardeners do not commence blanching until the plants are about 18 inches high, as it prevents rain and air from acting on the roots. The sort of Celery now grown for market is entirely changed; solid Celery is not used, but a much more spongy tall kind, which is ready for market in half the time the red solid (such as they grew 20 years ago, or what gentlemen's gardeners now grow) occupied, but the latter is by far the best. Market-gardeners cultivate a pink kind (no white is grown) which, on account of the richness of the land, is brittle and tender, and grows rapidly; but it would be much better flavoured if it had more time to blanch. The operation of earthing up is all performed by the spade, no hand earthing is employed. Parallel lines are stretched on either side of the row, 18 inches from the plants, and the mould is cut out of the alleys to form the blanching ridge. Late earthing up is effected in about three different times. *James Cuthill, Camberwell.*

## VILLA AND SUBURBAN GARDENING.

The ordinary mode of planting the various kinds of shrubs which ornament our villas, is apparently so simple and so easy, that it scarcely calls forth a remark. To dig holes and thrust plants into them is considered to require no great amount of knowledge or skill. Trenching is deemed useless and unnecessary, because it is believed by the inexperienced that plants will thrive alike under all conditions, *i. e.*, if the soil be

* There is no danger in using nails in this and some other kinds of inarching; they are overgrown by the new layers of wood, without any bad effects from their oxidation. I have had ocular demonstration of many of these inarchings, after the operation had been performed 17 years, and can therefore vouchfor the correctness of these assertions.

good; and if it happens to be indifferent, why, of course, there then exists a substantial reason for their looking stunted, scrubby, and sickly. Any amelioration of its natural unkindliness is never thought of; but, if it were, it would be looked upon as a wild theory propounded by some speculative mind. A case in point occurred the other day, when I was called in by the owner of a small villa residence to inspect the place and to give my opinion as to the reason why the shrubbery looked unlike that of his neighbour, both having been planted at the same period. The shrubs in the one I examined had made comparatively little progress. They were yellow and stunted, with the exception of two weeping Willows. On trying the soil, I found that at 6 inches below the surface there was a retentive clay, which had not been touched in planting, beyond a little scooping out where the plants had been inserted. They were thus placed in a clay basin, filled three parts of the year with wet puddle; the roots which were made in summer perished of course in winter. Now it will scarcely be believed that the ground-work of 70 per cent. of all the villa residences of our great towns is similarly "laid out." Contracts are entered into, and a polish is given to the surface. Shrubs and trees from the nursery, full of health, adorn the borders when the work is done, never more to assume a similar aspect; for, as my friend remarked, nothing could look healthier than the plants did when they were first planted. His gardener, a bright sample of the class employed at such residences, insisted that the soil of the place was the very worst in the locality—that nothing would ever make shrubs grow in it—that making any attempt at this would only be wasting labour; so that he found that there was no help for him but to live in the midst of plants struggling between life and death—diseased, yet still tenacious of life. In this dilemma, my recommendations were favourably received by the proprietor; but stoutly resisted, as being absurd, by the gardener. The first step was to entirely clear the whole ground, then to form secure drains, 18 feet apart, and 3 feet deep; and as road scrapings were abundant in the neighbourhood, to cover the whole 3 or 4 inches thick with them. Then to trench the ground 2 feet deep, well incorporating the road scraping with surface soil and clay, and then to replant the shrubs, taking care however that the roots were not crammed into the smallest possible compass, but regularly spread out to their extreme lengths, and the soil properly distributed amongst the fibres—in fact planted, but not according to the vulgar notion of doing this. Before commencing operations, however, I advised him to employ a competent person who understood what planting meant, and who would carry out the work in a proper spirit. I further assured him, that by following these simple recommendations, his shrubs would grow as well and kindly as any in his neighbourhood, but that everything depended upon how the instructions were executed. *Pharo.*

## Home Correspondence.

*Patent Rough Plate Glass.*—I was induced, a year ago, by your recommendation, to re-glaze my Grapery with Hartley's patent rough plate glass, 26 oz. to the foot, in panes 20 inches long, which I purchased of Messrs. Phillips and Co., Bishopsgate-street Without. Feeling, however, somewhat sceptical as to the result, from the novel character of the glass, I determined to glaze only half of the roof of my house at that time, until I was satisfied from experience, of its fitness for the purpose. I am happy to say the experiment has amply realised my wishes. The Grapes under the new glass were much finer than those under the old crown glass, the bunches being from one-third to one-half the size larger. I am so well satisfied that I have just finished the other part of the roof with the same sort of glass, and feel assured that any one who had seen my Grapes last summer, would have been completely satisfied as to the perfect adaptation of the glass in question to the roof of a Vinery. The wood has thoroughly ripened, and everything gives promise of a crop of fruit next season. *Thomas Canning, Elsenham Vicarage, Bishop's Stortford.*

*Bees.*—As you have often treated of bees, perhaps the following fact may be interesting to your readers. A friend of mine, who has kept bees for many years, removed, in July last, four miles from his former residence, and carried his two glass hives with him. All went on well till about 10 days after his arrival, when he observed some of his bees dead outside. As he could not guess the cause, he shut the doors at night, and when he went in the morning, he found the hives surrounded by strange bees, evidently waiting the opening of the doors to make a rush in; and no contrivance could prevent the fatal invasion, in which they not only succeeded in killing the inmates, but they either eat or took with them all the honey which had been made. Could it be that the "natives" were afraid of a famine in the land, by the new settlers arriving at that period of the year? and may my friend hope to be more successful with a new colony earlier in the season? *H M, near Worcester.* [If bees are moved at any season of the year when they are actively employed out of doors, it follows that they are much weakened; in the first place by the loss of those which are out at the time of removal, and cannot find their way to their new abode. In the second place, all those bees which start from the hive before they have observed its altered position return to the old locality and are lost. Thus weakened they are of course liable to be attacked and overpowered by any neighbouring hive; not, however, we should suppose from any jealousy of the new comers, but rather with a desire to rob them of their honey. In the case referred to, the effect of stopping up the entrance of the hive would be to enrage the bees and cause them as soon as released to side with the robbers, and help to destroy their own combs and honey. *Y.*]

*Garden Edgings.*—Perhaps some of your correspondents can inform me what would be a cheap and durable edging for the paths of cottage gardens, where the proprietor likes to see a degree of order and neatness kept up, but where the labourer has but little time to spare upon the ornamental part of his work. *A. B., East Norfolk.*

*Winter Gardening.*—There are several kinds of deciduous trees and shrubs which, on account of their purple, red, and variously-coloured shoots, are very attractive, and which, if judiciously associated with evergreens, would greatly enhance the appearance of our winter gardens. Deciduous plants of this character, either in clumps, or planted singly, would not only create variety, but considerably relieve the evergreens of their monotonous appearance. The subjects I would recommend for this purpose are Cornus sanguinea or red Dog-wood; Leycesteria formosa, whose stems resemble those of a gigantic Rush; and the Negundo, the beautifully polished green shoots of which are very handsome. These, again, would contrast well with the dark brown wood of Spiræa Lindleyana. Acer dasycarpum and A. striatum would likewise be eligible, as also the gold-barked Ash (Fraxinus aurea). To the above might be added Cornus mascula, which will bloom, even in a small state, from January until March. The above are the names of a few, and only a few, of such plants as occur to my memory at the moment; but however limited their number, they will serve to illustrate the kind of gardening which I should like to see carried out, and which, if adopted, I am certain would greatly beautify our winter scenery. *C. May, Hope Nursery, Bedale.*

*Sporting Laburnum.*—On a Laburnum tree, of about 12 or 14 years' growth, of the common kind, there are several tufts composed of thickly-set but slender branches, with blossoms, I am told, like the Broom, as the foliage is, but they are of a purple colour. Part of the tree has Laburnum blossoms of a purple colour also; but where this occurs, no seed-pods are formed; the principal part of the tree, which is of the yellow variety, bears seed plentifully. The garden is a strong deep soil, and there are other Laburnum trees, nearly similar in size, without this peculiarity; but on one younger tree, germs of a similar kind to what I have described are beginning to be thrown out, and which appear of a parasitical character. *E. W., Gloucester.* [We must refer our correspondent to the discussion upon this subject, which took place at p. 325, 1841, and at p. 397, in the volume for 1842. It is Cytisus Adami, a hybrid obtained between C. purpureus and C. Laburnum, and sometimes it breaks out the one and sometimes the other.]

*High Winter Temperatures.*—The very high temperature we have lately experienced is extremely rare at this particular season; it has not been so high since the year 1824, when the maximum on the last day of the year reached 53°, and again on the next day, Jan. 1, 1825, the daily mean temperature for that day also averaged above 50°. All these high hybernal temperatures are introduced by strong westerly winds, and accompanied by a high barometer. The wind blew from the west on the 31st of last month and on the 1st of January, with a mean of 50°, both by day and by night—the atmospheric pressure rather high. From Dec. 21st, to Jan. 15th, is absolutely the coldest period of the year, and any great departure from the mean, upwards, is very unusual, the short period of our winter being generally frosty. It will be remembered that last October was unusually cold. Now in the year 1817, that month was the coldest perhaps on record, and a mild January succeeded. It would appear then, that when the mean temperature is low in autumn, constituting as it were a kind of premature winter, the following winter will be mild, and in all probability be succeeded by a cold spring. The winter of 1846 was wonderfully warm, the mean temperature of January being 7°, and that of February 5½° above the mean of these respective months, and there were only 11 frosty nights during this period of two months, registered at Hyde Vale. On referring to the journal for the ensuing month of March, we find that all the fruit trees (the Apple tree excepted) were in blossom by the 31st, and the Horse Chesnut tree (Æsculus Hippocastanum) in the park just in leaf, and green. I shall conclude this short remark with an extract from my journal, dated Feb. 28th, 1846:—"On this day at 2 P.M., the thermometer rose to 60° in the shade; abundance of flowers in blossom everywhere; the meadows sprinkled with Daisies; in the market gardens between Bermondsey and Deptford, about 3 miles S. E. of the city, Plum-trees in bloom; Lilac-trees and hedge-rows (Quick Thorn) green; great quantities of flowers are gathered and sold in the London market, and even in the streets, and all kinds of vegetables are in plenty." *J. Henry Belville, Hyde Vale, Greenwich.*

*Pear Trees and Spring Protection.*—Some months ago, an article appeared in the *Chronicle*, from Mr. Errington, on the management of Pear trees. Anything on that subject being to me very acceptable, I read it with great interest. There was one part of it, however, which seemed rather doubtful. He says, if trees are previously properly attended to, by root-pruning, stopping, &c., it will, in a great measure, counteract the bad effects of late spring frost, because the wood will be sooner and more perfectly ripened. The trees I have to deal with were managed nearly in the manner Mr. E. recommends, and most of them showed bloom in abundance. Some of them I protected with Spruce branches; still the 14° or 16° of frost that Mr. E.'s trees resisted, left me the rudiment of a very thin crop. It is necessary to say that the situation of my trees is low and damp. Consequently the frost would take more effect on the blossom. It occurred to me on reading Mr. E.'s letter, that the vicinity of Oulton to the forest might possibly be one cause of his escape or success, as, having sufficient shelter immediately around the trees, the air without would be pure and dry. I do not, however, dispute the authority of Mr. Errington; but, how to protect trees from the effects of spring frosts, without incurring the expense of costly materials, does not appear to be very plainly pointed out in the letter alluded to. *S.*

*Uses to which Glass may be put.*—Now that glass is so cheap, it might be applied with advantage for many purposes for which it was once thought unfit. For instance, it would make good copings for Peach walls, &c. Whole orchards might be covered with it in the ridge and furrow system, leaving the sides open; and our walled gardens might also be closed in with it. The more late and hardy vegetables could be cultivated elsewhere. But why not use it more extensively still, as in the shape of canopies for walks, in order that a lady or an aged gentleman might take out-door exercise at pleasure in all weathers; and I see no reason why the drive round Hyde Park should not be covered over, the main walks of Kensington Gardens, and our new parks, besides all pathways and streets. This would do away, in a great measure, with umbrellas, and secure for us dry pavements. *James Cuthill, Camberwell.*

*Out-door Vine, at Nettlecombe.*—A few errors have crept into the article, which appeared at p. 822, of last volume, respecting the Vine that is trained against the gardener's house, at Nettlecombe Court, Somersetshire. In the first place, it is not a Black Hamburgh, but the Esperione. In the next place, no mortar or stone was used in planting it. It is also asserted that it is impossible to give it any assistance in the shape of nourishment, and that the rock out of which it grows, consists of a red grit stone, belonging to the slate formation. Now, the rock is wholly of the slate formation, and, owing to its loose texture, and the numberless fissures which it contains, the plant receives a great deal of nourishment from rain water, mixed with soil that flows over its roots from the land above. Your correspondent is right in stating that it is very prolific, and in a favourable season the fruit is very fine. It is trained on the horizontal system, and at the winter pruning the lateral shoots are cut back to one eye. In this way a crop is obtained regularly all over the Vine, from the main stem to the extremities. It was planted 18 years ago, and now it covers above 400 square feet of wall. The late Mr. Loudon once saw it, when it had a full crop of fruit on it, and he was much pleased with it. *Charles Elworthy, Nettlecombe Gardens.*

*Lead Tanks.*—What has perforated the sheet lead, as per inclosed specimen? It is taken from the lining of a salting tank, in use about 10 years, for salting bacon, &c. My plumber tells me it is the saltpetre, but that he never witnessed a similar case before. I cannot take his opinion. Would not the effect of any corrosive be in irregular holes and blotches? whereas these are round, as if drilled. My own impression is that a grub or insect is the cause. Pray observe that the holes appear to have been commenced from the under side of the lead, next the wood—some not entirely through; the holes are commenced sideways, and not perpendicular to the plane of the surface. I fancy in some of the holes I find the remains of an insect, with hard-cased wings like a beetle or flea. The whole sheet, 5 feet by 3 feet, is similarly perforated. I cannot say how long it has been in this state, as it has been out of use four or five years; but it was serviceable seven years ago, certainly. Pray give me your opinion on the matter. *Bishop's Castle.* [The perforations in the sheet-lead lining of the salting tank, which have rendered it useless, are, as you very rightly conjecture, not caused by the action of salt or nitre; they are probably the ravages of some small Coleopterous insect, the eggs of which were deposited in the wooden case below the lead. If you can send some of the wood, or can find any of the beetles living in it, they shall be examined; similar cases are not uncommon, and the evil is a considerable one, for new pests of this sort are occasionally introduced with foreign woods. The only certain mode of preventing their ravages appears to be that of burning the wood which they are found to have attacked. Would you send us some of the wood and another piece of lead, in order that they may undergo an entomological examination.]

*How to Smoke a Greenhouse Effectually.*—Take a sheet of touch-paper, spread it out, and roll half an ounce or 1 oz. of tobacco up in it, light it at both ends, put it into the house, leave it there, remain outside with your hands in your pockets, and the job is done. In the morning all the green flies will be dead. *Edward Huggins, Boston, Lincolnshire.*

*Hippeastrum aulicum.*—As this showy Amaryllid blooms beautifully in December, it is well worth a little extra care. A young plant has flowered with me three successive seasons in that month, and it is hailed with delight by every one who sees it at that dull season. I received it from the nursery about the month of April, when it had a good shift, and was put into an interme-

diate house. It grew away nicely, made a firm bulb by the autumn, and produced one flower spike bearing two flowers. The second year it produced two spikes and four blooms. The third year three spikes and seven blossoms, each eight inches across, which remained in beauty three weeks; and next December I expect six spikes of flowers, as it has now two large bulbs and two small ones. Many people only allow their Amaryllids to have one bulb, breaking off all additional ones as they appear. This I consider bad practice, as they are much more effective when grown in a mass like an Orchid. The compost I use for them is loam, leaf-mould, peat, and sand. Temperature in winter 45° to 60°; summer 60° to 80°. *I. Rust, Pashley, Ticehurst.*

*Protecting Timber.*—Three carpenters, who have been brought up in the country, all affirm that Oak ought not to be painted or tarred, but that Deal fences last longer if covered with Stockholm tar; gas tar, on the contrary, they say, burns the wood. *J. Cuthill, Camberwell.*

*Oxalis Bowei.*—It has been stated that this Oxalis should be protected from frost. I have grown it, at Nettlecombe, for these last 16 years, without any protection whatever. The bed was prepared in the following manner:—The earth was removed to the depth of 2 feet. I then introduced 8 inches of drainage, laying on the top of it a layer of fresh turf, with the view of preventing the soil filling up the insterstices. I then filled up the bed with equal parts of well-rotted, turfy loam and leaf-mould, intimately mixed together. In May, I turned out the plants, and placed them, so that the bulbs might be 3 inches below the surface. Thus circumstanced, I have never found them to receive any injury, with the exception of the foliage being destroyed by frost. They flower beautifully every autumn. *Charles Elworthy, Nettlecombe Gardens, Somersetshire.*

*Floating Islands.*—I am about to construct a floating island on an exposed and rather extensive piece of water. Now will some of your correspondents be so good as to tell me, first, what is the best sort of timber for this purpose? Second, Should it be green or dry? Third, What shape would look best? Fourth, How long will it be before it may be expected to sink or require removing. And sixth, the water being at least 8 feet deep, if made of any size, what would be the best method of mooring it. *A Subscriber.*

*Collecting British Plants.*—I learn from your Paper that the Caledonian Horticultural Society awards prizes for collections of dried British plants. Now, the object for which these prizes are given is a good one, and would be of advantage to science if the thing were rightly carried out; but as yet the prizes have almost always been won by men employed in the botanic or experimental gardens, and the range of ground gone over by them in quest of the plants, could not be more than from six to eight miles around Edinburgh. Now, that ground has already been so often examined that I think it is high time for the Society to extend its influence to every corner of Scotland. It might all be worked upon the six or eight mile system, as around Edinburgh; for beyond that distance I believe that there are many places seldom or never visited by botanists; so that if encouragement was given to gardeners at a distance to collect for the prize, many rare plants might be contributed; and if the collectors were bound (if required) to send in plants for the Botanic Garden at the same time, the collection there would soon become much improved. I am anxious that some such plan as the one I propose should be adopted. *Pseudo-Falcon.* [Our correspondent will see the inconvenience of taking the signature of a well known contributor to our columns.]

*Silver Firs.*—In the deer-park at Lord Farnham's, in the county of Cavan, is a fine healthy tree, of some 60 or 80 years' growth, which has thrown out near the bottom, a side branch which has turned upwards, and has become a second perfect Silver Fir, of some 16 years' growth. It has a singular appearance, as if two trees were grafted together. *Cavanensis.*

## Societies.

Horticultural, *Jan.* 14.—E. Brande, Esq., in the chair. A. Lawson and J. H. Good, Esqs., were elected Fellows. Mrs. Lawrence showed a quantity of cut flower spikes of Amherstia nobilis, some account of which is given at p. 824 of our last volume. It was stated that it has been flowering at Ealing Park in great profusion for some weeks, and, though now rather past its best, it is still in great beauty. This makes the second year in which Mrs. Lawrence has flowered this fine stove tree, which nobody else has yet been able even to grow successfully. Much difficulty has been experienced in keeping the foliage, which is exceedingly graceful, from first decaying at the points, and then dying back; but naturally nothing of the kind happens, and it has only occurred with Mrs. Lawrence in a very trifling degree. The brilliant salmon-coloured and yellow inflorescens is very handsome, and when it is mentioned that 16 and 20 blossoms such as that now represented are often arranged in a single raceme, some idea of the beauty of the plant may be conceived. At Ealing-park it is beginning to form seed-pods. A large Silver Medal was awarded it.—Mr. Loddiges sent examples of Ansellia africana, an Orchid named after Mr. Ansell, who when attached to the Niger expedition discovered it in the Island of Fernando Po. In addition to its stately aspect and good quality of continuing long in bloom, it is remarkable as being one of the very few of those Epiphytes which have been found on the stems of Palm trees. A Banksian medal was awarded it.—Mr. Dobson, gardener to Mr. Beck, of Isleworth, sent three yellow-flowered Oncids (O. Cavendishii, ampliatum, and another kind), and a group of seedling Cinerarias, which were exhibited to show that by sowing a little seed in May some very gaily blooming plants may be obtained about Christmas, when every stray flower is valuable. It was stated that at Worton Cottage a constant succession of such plants had been kept up since November.—Mr. Davis, of Oak-hill, East Barnet, received a Certificate of Merit for samples of West's St. Peter's Grape, black as Sloes, plump, and covered with bloom.—A brace of Cucumbers was furnished by Mr. Parr, gr. to J. Jarrett, Esq., of Camerton Court, near Bath.—Examples of a new kind of garden label, called "Rose girdle label," were produced by Captain Armstrong, of Claremont Lodge, Cobham, Surrey. They consisted of a strip or band of zinc, painted where the name was written. They are intended to be bent round the stem of the tree or whatever else they are to be attached to, the ends brought together and fastened by means of a screw and nut. Whether they will be found altogether unobjectionable, remains to be proved; but they are very cheap, and looked as if they would answer well.—From the garden of the Society came six nice plants of the better varieties of Epacris, the round-leaved Acacia, a suitable species for

pot culture, the pretty winter blooming Selago distans, Erica hiemalis, and six Orchids, among which were Barker's variety of Lælia anceps, a beautiful kind, and a highly coloured and compact Bird's-head Oncid (Oncidium ornithorhynchum). The same establishment also furnished cut blooms of Chimonanthus fragrans and its large-flowered variety; specimens of Easter Beurré and Beurré Rance, Pears, which have ripened earlier this season than usual, owing to the dry summer; Hubbard's Pearmain Apple, a very hardy excellent kind, not so much cultivated as it deserves to be; and examples of Bassano Beet, a Turnip-shaped sort, not sufficiently good, it is to be feared, to suit our English taste, but which, according to the "Bon Jardinier," 1842, was found by M. Audot in all the markets from Venice to Genoa, in June. It was young, tender, very delicate, and preserved its rose-coloured zones after cooking. It is said to be much esteemed in the north of Italy. In this country, with good cultivation, its produce may be estimated at 40 to 50 tons per acre; and it may be grown on thinner land than is required for the other kinds of Beet, as it grows mostly above ground, like a Turnip.

## Notices of Books.

*The Florist and Garden Miscellany.* Vol. III. 8vo. Chapman and Hall.

We have had occasion formerly to recommend this beautiful book to the lovers of floriculture, not merely because of the truth of its representations of florists' flowers and the honesty of the opinions it expresses, but because, in addition to mere disquisitions about the points of a flower, it contains capital practical matter, by men thoroughly acquainted with the subject on which they write. What we said before we say again; with the addition that the Editor now proposes to introduce the fruit garden to his pages, a great, and we doubt not, very acceptable extension of the range of his subjects.

## Garden Memoranda.

Horticultural Society's Garden, Turnham-green.—Since we last visited this establishment, various alterations have been effected, and others are still in progress. A number of the less important trees have been removed from the Arboretum, which had become too much encumbered with timber, and the result is an evident improvement in its general aspect, as well as more uninterrupted room for visitors at the great exhibitions to promenade in, while there are yet ample trees left for the purposes of ornament, and to afford an agreeable shade from the scorching rays of a summer's sun. In addition to the extensive alterations which took place last spring on the eastern side of the Arboretum, the corner nearest the grand entrance to the grounds at Chiswick House has been much altered and improved, and a new American garden is at present in course of formation on the west side of the kitchen garden. In order to accomplish this, the thicket of miscellaneous trees and shrubs, which previously occupied its site, has been removed, except such as were considered of sufficient value to be retained; various excavations have been made, and mounds thrown up, whose sides are planted with Evergreens, Yuccas, and other ornamental plants; and, to give variety as well as afford at suitable places views of the general arrangement, the embankments are traversed by paths which are conveniently approached by flights of rustic steps. As it was desirable that the van-road to the exhibition ground should be continued from the carter's yard through the kitchen garden, a bridge, whose supports are flanked by rockwork decorated with Ferns, the lively green hue of whose fronds cannot fail to yield interest at all seasons of the year, has been thrown over the upper portion of the new ground, which is to be entered at this end through masses of Rhododendrons. It being intended that this garden shall be gay the whole year round, or at least nine months out of the 12, it will be furnished with plants calculated to effect that end, and if well carried out, as there is little doubt it will be, it will not only form a pleasant retreat at all times of the year, but will also be, for obvious reasons, very instructive. We had nearly forgotten to mention, however, that some of the more prominent and steep portions of the mounds have been faced with burrs, which also appear as edgings, and on the banks wherever it was thought their introduction would heighten the general effect. But it is not in ground work alone that the Society has been making alterations. In order that it might be more useful in distributing plants among the Fellows, a new span-roofed propagating house, 63 feet long, has been erected. This is in two compartments, with a pathway up the middle and beds on either side; it is heated by means of hot water in iron pipes, and it is also conveniently furnished with a potting-shed and boiler-house, all under one roof. It may be mentioned, in regard to the striking glasses employed here, that those having a true bell shape are the best; it has been found that flat-headed ones, with nearly perpendicular sides, permit condensed moisture to fall on the cuttings, while in the other form, it runs down the glass into the sand at the side of the pot, and does little or no harm. The lean-to house, beside the open cistern in the experimental ground, has been converted into a very useful span-roofed house, as has also a long pit near the end of the carpenter's shop; and considerable additions have been made to the other brick pits in this quarter. When it is recollected, therefore, in connection with the alterations that have just been glanced at, that the orchard has been but recently almost entirely remodelled, it will be apparent that the condition and appearance of the garden is steadily improving.

## Miscellaneous.

*On the Eatable Lilyworts of Siberia.*—The terrible ravages committed by the Potato disease have made it very important that some vegetable, easy of cultivation, prolific, nutritious, agreeable to the taste, and easy of digestion, should be found which may replace the article of food of which that disease has almost entirely deprived us. Many plants have been proposed for this purpose, but hitherto without success; the Yam, Sweet Potato, and Cassava require the heat of the tropics, and cannot be cultivated in northern climates. The tuberous Tropæolums are too strong-tasting; the Jerusalem Artichoke and Oxalis are too watery; the Apios, or Saga-ban, takes too much space for its cultivation, and becomes hard and unpalatable; the Psoralea esculenta, from which so much was expected, has proved, to a great extent, a failure; the Camassia esculenta is more likely to answer the purpose than the two last-named plants, provided always it can be quickly and easily propagated. The Camassia is, of all the above-named vegetables, the only one which can be compared with the Siberian Lilyworts, which have been long used as an article of food, and deserve to be better known than they are. Erythronium Dens canis, the large flowered variety of which is very common in the south of western Siberia, is there gathered, and much esteemed as an article of food, and used in former days to be sent to the court at St. Petersburgh. It may be raised from seed with certainty, and in large quantity; if the seeds are sown as soon as they are ripe, they all come up, but three years are required to enable the bulb to attain its proper size; its country name is

kandyk. Lilies are called sarana in Siberia; the most esteemed are Lilium tenuifolium, F., and Sarana kamschatica, F. (Lilium kamchaticum, and Fritillaria kamchatica of the books). Lilium spectabile, F., is also eaten. These three plants multiply with great rapidity, and tenuifolium almost exclusively by seed, the other two by scales also; and it seems that each scale of the bulb, which scale is long and pointed in L. spectabile—thick, short, and tubercular in the Sarana of Kamchatka, forms a new plant; this mode of propagation is indeed essential to the Sarana, inasmuch as it produces but few seeds, sterility being very common. There is also in Kamchatka a Lily, somewhat like L. canadense, which I call L. avenaceum, from the name it bears in the country, and from the resemblance of the scales of its bulbs to large seeds of the Oat. This species is not yet found in gardens; in its native country it is eaten like the common Sarana, which is, however, preferred to it. These useful plants are not cultivated in Siberia; the bulbs of the wild plants are collected in abundance. Lilium tenuifolium and spectabile are met with in the eastern part of the Government of Tomsk, and are spread round the Baikal and all over Daouria to the eastern ocean. The Sarana of Kamchatka is found all along the coast of the Eastern Ocean, in Kamchatka itself, and in the islands on the western coast of America. It is not impossible that satisfactory results might be obtained from its careful cultivation. The southern steppes of Russia are covered in the spring with beautiful Tulips, and among them there is a species, partly common on the Don, not differing much from Tulipa suaveolens, and which is eagerly sought for and eaten by the inhabitants, who can distinguish it with ease from the other species, which they do not touch. *Flore des Serres.*

## Calendar of Operations.

*(For the ensuing week.)*

GENERAL REMARKS.

As soils long under cultivation, and frequently manured with ordinary stable and cow-house manure become effete, and cease to grow some kinds of vegetables well, it is important at this season to adopt some means for remedying this by applying a good dressing of one or a mixture of all of the following ingredients. Fresh meadow soil, with the turf well chopped up and laid between the top and bottom spits as the trenching goes on, will give renewed vigour to our garden crops for several years. Burnt clay is an excellent reviver of old soil. Charred refuse, and, for stiff clayey land, lime rubbish and coal ashes are valuable for their mechanical action upon the texture of the soil, thereby rendering it more easily worked, and more productive. A mixture of all these will be beneficial to soil of any kind by supplying new substances to the plants; and in many cases is preferable to ordinary manure. For applying all such material to the kitchen-garden compartments, take advantage of frosty weather, as the cart may then do in half the space of time what at other times must be done by the barrow. We may add that for improving the productiveness of light sandy soils, marl is often used with advantage, from the great capacity which it has for absorbing fertilising gases, and retaining them to nourish the plants during drought. In many gardens the Strawberry does not thrive until a good dressing of marl has been applied; and now is the best time for supplying it.

PLANT DEPARTMENT.

ORCHIDS.—These should be carefully watched at this season, as many of them will be starting into growth. As soon as this is perceived in any plant, it should be repotted or supplied with a larger block or basket, if necessary. In shifting Stanhopeas, or other Orchids, which send their flower stems through the soil, very shallow wire baskets should be used, without potsherds, charcoal, or any other impenetrable material. They succeed admirably in lumps of fibry peat, from which the soil has been shaken out, mixed with rough flaky leaf-mould, and plenty of clean sand, which is necessary to prevent the leaf-mould and peat from becoming too spongy. The surface of the soil, and the inside of the basket, should be lined with sphagnum, which protects the roots from sudden gleams of sunshine, prevents the soil from falling out, and, by its powers of absorption, keeps itself and the soil sufficiently moist. Maxillarias, Lycastes, Gongoras, &c., succeed better when treated in this manner than they do in pots; but in soil for these, a good proportion of charcoal and potsherds, or pieces of sandstone, may be safely added, as their flower stems are altogether above the soil. Those plants which do not require shifting should be surfaced with a little of the same material as would be used in removing them to larger pots or baskets. As soon as any plant is potted or top-dressed, it should be dipped into the warm-water cistern, that the whole of the peat, &c., new and old, may be thoroughly and equally moistened. If a little trouble is taken in this operation, any woodlice or other insects which are harbouring in the soil will retreat before the rising water, till they come out on the surface, whence they may be easily removed. A gentle syringing will be useful on fine mornings, particularly to the plants which are attached to blocks, as it is yet too early to keep up a sufficiency of moisture in the atmosphere. Water must be very carefully used, and should always be of the same temperature as that of the house. The rain which falls on the roof should be conducted into a tank within the house; it is preferable to river or pump water, which generally contains eggs of insects injurious to Orchids. For the further protection of the plants from their ravages, the peat and leaf-mould should be thoroughly baked, and the sphagnum immersed in boiling water, in order that all animal life may be destroyed before they are used. As the plants commence their growth, remove them to the warm end of your house, if you have only one; but it is impossible to grow them to perfection unless you are able to keep the dormant plants cool and dry, and those in a growing state comparatively warm and moist.

FORCING DEPARTMENT.

PEACH-HOUSE.—From the time when the Peach and Nectarine blossoms begin to expand, maintain a steady night heat of 45° to 50°, and not rising higher than 60° during the day, unless by sun-heat. If the external temperature is not too low, a sufficient quantity of fresh air should be admitted every day, but avoiding syringing until the bloom is set. In very cloudy weather have recourse to artificial impregnation, as the pollen does not move so freely as in bright sunny weather. If the early Melon bed is not yet made, it should be immediately attended to, and should be constructed in such a manner as to secure a continuous and steady bottom heat. If you have not hot water at command, this can be effected by Oak-leaves made up into a bed 4½ feet high, and well trodden; these maintain a steadier heat than horse-litter, and when the heat begins to decline, add linings of fresh material. Where Cherries are required early, the house should now be in proper order as regards cleaning and painting. The temperature should be kept at 45° by night and 55° by day with air, until the buds begin to expand, when a rise of 5° should gradually take place. The fruit will set with the low temperature of 50° by night, and 60° to 65° by day. No kind of fruit requires greater care in forcing than this, as any excess of heat during the time of setting will prove ruinous. Air is indispensable during the day, while the trees are in flower, and even at night, when the external air is not too cold.

FLOWER GARDEN AND SHRUBBERIES.

If the advice, given in August and September of last year, has been attended to, by deciding upon the arrangement for the different portions of the flower garden, and also by noting the number required of the different kinds of plants, an inspection of the stock at the present season will show of what kinds there is a deficiency, and thus determine what quantity of young plants have to be propagated between this time and the end of April. But if memoranda were not made at the time recommended, the arrangements should be decided upon before the season is farther advanced. Bouvardias, Salvias, Lobelias of the section to which propinqua belongs, and other half-hardy, deciduous plants, should now be looked over, and if the stock of any is deficient, it should be increased by the usual means. Preparations should now be made, by getting soil, pots, and crocks ready for potting off plants in store pots, of such things as fancy Geraniums, Petunias, Calceolarias, &c. &c. In the meantime, let all half-hardy bedding plants be duly attended to, as regards watering and the removing of decayed leaves, and occasionally stopping long weak growths.

FLORISTS' FLOWERS.

There has seldom been so mild a winter as we have hitherto experienced, consequently redoubled precaution is necessary to guard against sudden or continuous frosts. True, if our instructions have been followed out, not only Auriculas, Carnations, Pinks, and Pansies ought to look well, but they ought to be sufficiently hardy to bear a tolerable degree of frost. Auriculas, particularly, will now begin to move, consequently they will require more water, and with more moisture they will want more air; this latter is absolutely required when the former is applied. The open weather will cause Tulips to peep perhaps rather prematurely; we would advise a handful of sandy loam being placed over each; this slight protection will be found highly beneficial. Fasten the soil round Pinks and Pansies; for worms, during this open season, often loosen those which have not good hold of the soil. Examine Dahlia roots, and give air especially to Verbenas. Hollyhocks should not be forgotten; snails are very fond of them; a handful of soot will not be misapplied round about them.

KITCHEN GARDEN.

Success in our gardening operations, as in the numerous other affairs of life, depends very much on careful attention to small matters, many of which, if examined individually, appear trifling, but if omitted or neglected, prove detrimental to the attainment of our hopes. Amongst the little things to be looked closely after, at this season of the year, the garden snail, the common grey slug, and their congeners, may rank among the very first. These hide themselves in the earth, Box edgings, and other snug corners, till warm weather occurs, when they come forth and attack every vegetable in their way. On a mild day hundreds may be seen crawling over the walks, of which a great number may be picked up by a quick boy, as they frequently continue visible during the whole of the day at this season. By beginning to destroy them thus early, the ground is comparatively freed from these ravagers by the time our young plants appear in spring. Seakale is most profitably forced by means of a slight hot-bed of leaves and litter, with a frame upon it; the bleaching being ensured by covering with wooden shutters; 53° to 55° is sufficient for top heat. Look closely after Endive in damp weather, and remove all decaying leaves. Examine Cauliflowers and Lettuces in frames, and dust a little quicklime amongst them if necessary. Give plenty of air on all favourable occasions. Make a sowing of Radishes under a south wall, and when they come up protect them with a few evergreen boughs, or spread a little short litter over them on frosty evenings, and remove it with a light wooden rake into the alleys in the morning.

State of the Weather near London, for the week ending Jan. 16, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 19th, 1828—therm. 60 deg.; and the lowest on the 19th, 1838—therm. 4½ deg. below zero.

## Notices to Correspondents.

APRICOTS: *A H.* We do not know whether or not the Kaisha Apricot flowers earlier than other sorts. Messrs. Veitch can best answer this question.‖

ANALYSES: *Alaunensis.* Common Sedges contain on an average nearly 2 per cent. of silica. Sprengel has published an analysis of Carex muricata; 100 parts of the green plant gathered in flower contained 60 parts of water, and when burnt left an ash containing 2½ parts of silica. There are no good chemical analyses published of the comparative composition of arteries and blood-vessels. We doubt the existence of silica in either, except as an accidental occurrence, or in exceedingly minute quantity.

BOMBAY PLANTS: *C F J.* The plants have no market value. They are well known. You will scarcely keep them alive in the manner you describe. A stove, with bottom-heat, and plenty of light, is necessary for all except the Bougainvillea, which will grow out of doors in summer and bear a greenhouse in winter. You had better get them placed in the Botanic Garden.

BOOKS: *J P.* There is no new edition of Liebig—and if there was we should not recommend you to buy it. The work you have is the best in English, so far as Physiology is concerned; for Chemistry consult "Johnson's Lectures on Agricultural Chemistry," and procure a copy of "Knight's Physiological Papers."—*W P.* "Macintosh's Practical Gardener."‡

CELERY: *H T.* It has possibly been allowed to get frosted before it was earthed up.‡

CITRUS JAPONICA: *A Florist.* It should have strong fibry loam, *not clay*, and be well manured. But to get it into health now that it is half dead, you must give it a smart bottom heat in February, and shut it up close till it has begun to grow freely. In doing this shorten all the shoots, cutting out the spindling branches.

COST OF FRAMES: *Sub.* You will easily ascertain by inquiring of two or three carpenters, and taking the lowest offer.

COUNTRY SHOWS: *G S.* We intend to notice in future all that send us their reports.

EMIGRATION: *N P H.* We have no disinterested information about Natal, and we cannot trust interested parties in so grave a matter. The best work to consult is Christopher's "Account of Natal," one vol., 8vo, published by Effingham Wilson; in which you will find a good map of the country.

EUPHORBIA SPLENDENS: *Sub.* It often sheds its leaves before the plant blossoms.‡

FILBERTS: *J K F.* The manner in which they should be pruned has been fully described at p. 101 of last volume.‡

FLORISTS' MEETINGS: *S. w. l.* We have made arrangements to report in future all that are of importance.

INSECTS: *D.* Your beetle is the common green Rose-chaffer, Cetonia aurata *W.*

NAMES OF PLANTS: *Erzeroum.* 557. Veronica Beccabunga; 60. V. caucasica; 226. V. pedunculoris; 447. V. persica.—*A Subscriber.* It is not an Orchid, but a Tillandsia. Hang it up in the stove till it begins to grow; then pot it in tolerably dry soil and treat it afterwards like a stove plant; only never water the roots; but pour lukewarm water over the leaves.—*H and Son.* We cannot consume time in determining the names of plants from miserable bits without flowers.‡—*M K D.* They are some kind of Juniper, and perhaps J. excelsa; the specimens are insufficient for exact determination.

PAINT FOR IRON: *H B.* See pp. 120 and 188 of our last volume.‡

PINE APPLES: *A Subscriber.* For Pines either in pots or planted out, the bottom-heat should be 80°; the bulb of the thermometer being plunged about a foot below the surface of the bed in both cases.

PLANTING: *Newstidi.* Do not plant your cheesy land now. It *must* be dry first. Either wait till February, or defer the work till next October, in the meanwhile taking off it a crop of Potatoes. If you have lime or chalk at hand, give it a heavy dressing. You may grow Ash, Oak, Scotch Firs, Elms, Sycamores, and form a covert with Berberis aquifolium, or *Yew*, which thrives in such places. Larch will grow in such a place, but it will take the rot by the time it is 20 years old.

SPINACH: *W Tuck.* It is Orach, not Spinach. We will tell you all about it next week.

TIMBER: *J F., jun.*, is referred to the "Mechanic's Magazine," Nos. 1282, 1321, 1349, 1415, and 1416, for information respecting the seasoning and preservation of timber. The importance of the subject having seemed to require that attention should be repeatedly called to it, some repetitions unavoidably entered into the papers furnished to the Magazine, though they each of them contain much matter peculiar to itself. Should "J. F." wish for further information than those Magazines afford, especially as to seasoning wood on a small scale of operations, on stating his queries to the Editor of this paper, replies to them will be early furnished. *M.*

VINES: *L H.* It is better that the roots should be on the outside the house, if the border can be properly formed; if not, the roots are best inside; but in that case means must be provided of watering abundantly with luke-warm water when necessary. Twelve feet is wide enough for a Vinery. We cannot answer inquiries privately through the post. We would advise you to read what has lately been said about concreting Vine borders in bad climates or situations, especially at pp. 772 and 820 of our last volume.—*C.* The Esperione will suit the situation you describe.‡

THE LONDON MANURE COMPANY beg to offer as under:
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.
The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | | |
|---|---|---|---|---|
| Clover Manure, per ton ... ... ... | ...£11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S, Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

DO YOU BRUISE YOUR OATS?
No; then you lose 50 per cent.
A NICE STABLE MESS, effecting immense saving, and vastly improving the condition of the animal—bruised Oats, straw cut into chaff of a certain length, and a little hay; the whole steamed, and served up at discretion. No rack—down with the racks;—MARY WEDLAKE'S MACHINES, 118, Fenchurch-street, and 11, Tavistock-street, Covent-garden, where a machine may be seen at work. A pamphlet on the above, by sending 12 postage stamps.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.
BENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.
*** A second-hand span-roofed House for Sale very cheap.

# The Agricultural Gazette.

*SATURDAY, JANUARY* 18, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| WEDNESDAY, Jan. | 22 | Agricultural Society of England. |
| THURSDAY, — | 23 | Agricultural Imp. Society of Ireland. |
| WEDNESDAY, — | 29 | Agricultural Society of England. |
| THURSDAY, — | 30 | Agricultural Imp. Society of Ireland. |

THE difficult question, "What is to become of our heavy Wheat soils?" has of late become an interesting one, as it always does when the price of Wheat falls below a certain level: for then, if we can believe it, "they must of necessity be thrown out of cultivation."

That there is a great deal of groundless prejudice existing on this subject cannot be denied; for before lands of this description are fit for being laid down to Grass, or subjected to any other culture than that which they are now under, they must undergo a process of drainage and other improvement, which would render them fit for growing Mangold Wurzel and Cabbages, or even Swedish Turnips—yes, and an additional quantity of Wheat itself—which would, in the vast majority of cases, very far counterbalance any depreciation which has taken place in prices. And, moreover, the fact is notorious that at present large fields of this class of soils are obliged to be broken up from a worthless state of pasture, and to be subjected to Wheat culture, in order to render them tenantable—so different is sound practice, and the urgent demand for bread by an increasing population, from the theories and prophecies of the fearful. Indeed, a correspondent informs us that a certain landlord who labours under the belief that such soils cannot be cultivated under present prices, is nevertheless breaking them up as fast as he can get them into his own hands, from a state of worthless pasture to Wheat culture. And what renders circumstances connected with this example still more amusing, is the fact that on going over the Park and Park farm, he found the landowner and his old manager labouring under an equally gross delusion; for although about two-thirds of the lands were composed of drifted materials, in which chalk largely predominated, in not a few instances forming on the whole a superior Turnip soil, yet the second question put to him was, "What do you think of our cold clays?" "We were then," says he, "standing on the finest Turnip soil in the kingdom, and hence were a little taken by surprise; but, although the worthy and improving landlord, who had just succeeded to the property, had, up to this date, been belaboured into the belief that these lands were of this character, yet we had no great difficulty to convince him that there was a considerable difference between chalk and Oxford clay." In this case an excess of moisture, coupled with an antiquated practice, conferred upon the soil many of the characteristics and disadvantages peculiar to the clay on which it was incumbent. The want of drainage, therefore, and a proper system of management, generally, converted the elements of a Turnip soil into that of a Wheat soil requiring fallowing; so that in this example we have the conversion of one kind of soil into another, not by the mechanical and chemical agents of agricultural science, but by mere neglect and carelessness.

The practical point at the bottom of this discussion is, *the expensive system of fallowing*—one purely agricultural, although parties have always had recourse to it as a subterfuge in politics, for the want, we presume, of better argument; for out of the 22,000,000 arable acres in the three kingdoms subject to the plough, there are probably about 16,000,000 partially subject to Wheat culture, while there are not more than 2,000,000 acres of this sum under fallow annually, and about 5,000,000 under Wheat.

According to the hypothesis of 2,000,000 acres annually under fallow, and a four course shift, we would have consequently 8,000,000 acres of Wheat soils, from which therefore we only obtain *three crops every four years*. Now, if we could, by any improved system of management, obtain alternately with Beans, as now grown, from 20 to 30 tons of Mangold Wurzel or Swedish Turnip per acre, on the 2,000,000 under fallow (say, for the sake of argument, on an average, 25 tons, at 5*s.* per ton), then such a result as this would amount to an increase of 12,500,000*l.* annually on the value of our agricultural produce; and, with a result of this kind, we may safely conclude that an increase of some eight bushels of Wheat and Beans per acre would also be obtained respectively from the other parts of the land under that course of cropping. If we, therefore, take 2*l.* per acre as the value of the increase of corn and straw on the remaining 6,000,000 acres, it will give us a grand total increase of from 20,000,000*l.* to 30,000,000*l.* annually. Again, if we suppose that the farmer is able to turn the one-half of this sum into profit, for we cannot suppose it possible to turn the whole, because such an increase of produce must of necessity incur an increase of manure, outlay of capital, and expenses generally, although the increase of working capital and annual expenses incurred would by no means be proportioned to the increase of produce—if we suppose that the farmer is able to turn the one-half of such a sum into hard cash, it would obviously meet on his balance-sheet many of those short-comings at present experienced.

The practice of fallowing is an old-established one, and more than a favourite with many; and certainly to propose dispensing with it until a more valuable equivalent was found, would be to rush into inevitable ruin; but although this may be true, yet, like all other old favourites, the value of the practice is liable to be over-estimated, for the very theory of fallowing itself pre-supposes something imperfect in its practice—the subduing of a certain evil, rather resulting from improper management than inherent in the soil naturally, which the farmer is never able finally to conquer, or a repetition of the warfare would not be required. For, though we suppose a field fallowed in the highest possible degree, the whole of the benefits gained resolve themselves into certain chemical and mechanical changes to be over and over again effected, as often indeed as the field is fallowed—the restoration of a certain chemical and mechanical condition. And this can be done in the vast majority of cases, without resort to naked fallows, by *efficient drainage, manuring, and tillage*.

The matter after all, therefore, resolves itself into the somewhat questionable form of the efficient drainage of our 8,000,000 acres of heavy Wheat soil—entailing, in the first place, a heavy outlay of capital on the part of the landlord, and, in the second, a considerable outlay of capital, in the shape of stock and labour, on the part of the tenant, while to both the efficient drainage of this class of soils is yet but little understood, and much disputed. Doubtful as the ultimate performance of such a great work may appear, we venture to say that, were labourers more freely employed—were the money which the landlord and tenant now spend in poor rates, spent in draining, it would soon effect the work, without either party experiencing any inconvenience of a drain upon their working capitals, while the increase of produce which is to repay them would be realised. *B.*

## THE DRAINAGE ACTS.

THAT Mr. Girdwood's experience as an Inspector under the Drainage Acts exceeds my own is very probable, and is a deserved testimony to his ability; nevertheless I yield to none in knowledge of or interest in the subject of drainage, inasmuch as it was my lot to be an early and recognised labourer, with those whose recent removal we have to lament, in the pioneering of that path which led the Legislature to adopt the principles we propounded, both in the public acts, and in the incorporation of the drainage companies. It was not without labour, anxiety, and money (and few know how much of each such an attempt entails), that existing facilities have been secured; and so far as it may yet lie in my power, further efforts shall not be spared to render effectual the good that has been so attained.

The instance alluded to of the steward of an applicant being made an Assistant Commissioner, is that of Mr. Faint, of Wood End, near Thirsk, in this county. The late Sir Samuel Crompton, of Wood End, was one of the earliest applicants for an advance under the first act; and the preliminary inspection was entrusted to myself. Along with the other requisite particulars my report contained a well-merited expression of approval of the drainage that had already been done, and consequently of my confidence in the ability of Mr. Faint to conduct the work contemplated under the Act. I afterwards inspected the first portion of the drainage that was completed, and certified to its effective execution. Mr. Faint was subsequently appointed, and is now acting as an Assistant Commissioner, and my services have never since been required there. The following extract from a late communication from the Board indicates the practice that prevails, and which is not only irreconcileable with the rules Mr. Girdwood describes, but is wholly at variance with the spirit, if not the letter, of the Act of Parliament. "The Commissioners are desirous, as far as practicable, to consult the wishes of landowners in the selection of inspectors, and do not consider themselves in any way bound to continue the inspection of any particular property under the gentleman who may have been called upon to make the preliminary inspection and report; and they are not in the habit of calling upon landowners to give any reasons for wishing a particular inspector to report upon their works." It would be a reflection on the reader's perception to occupy his time by pointing out the abuses to which this may conduce; suffice it to remark that since the inspectors have entrusted to them, and are responsible for not only the permanent and effectual execution of the work, but also the correctness of the amount of its cost, they ought to be independent of any influencing patronage, and should moreover be supported and protected by the administrative power in the discharge of their important duties, rather than be exposed, as they now are, to such capricious or uncalled-for changes as applicants may desire. It is quite true the Commissioners "may from time to time remove any such Assistant-Commissioners," and "may make such other inquiries in relation to any such application as they may think fit," but the Act nowhere authorises any interference from applicants in this particular; and, although, as is usual, the reasons for removal are left entirely to the discretion of the Commissioners, it is manifestly implied that such a step should not be resorted to without reasonable and proper grounds. Were it otherwise, an inspector's professional reputation would be subject to the most serious injury which one man can inflict upon another, without a prospect of either justice or redress.

I most fully concur with Mr. Girdwood, in regarding the advice of the inspector as of the highest value, not only as respects the execution of the drainage itself, but, if his attainments in the most approved agricultural practices of the day be such as his position demands, in suggesting also that course of subsequent operations which, according to circumstances, is best calculated to realise the full measure of advantage from the drainage work. It is for this reason that I conceive it is very poor economy to set a scanty limit on the inspections which an Assistant Commissioner may deem it right to make; and, I for one, rather than be so restricted, would willingly accept 1*l.* per day, in lieu of 3*l.* 3*s.*, for such visits, whenever I thought it desirable to see what was doing. In the instance given by "J. T.," for example, how could any one, with only two inspections, certify of his own knowledge, and in the unqualified terms required, that drainage to the amount of 400*l.* had in all respects been properly executed? One visit would, of course, be needed for the preliminary inspection and report; and another must necessarily be made on the completion of the work, or he could not know it was done at all; but I hold that at least one intervening inspection of the work during its progress is indispensable to a satisfactory assurance of its being effectually done. No doubt, in some degree, the proportionate amount of charges on the smaller applications, may exceed that on the larger estates; but in the case before us, it is the great discrepancy between the inspection and what may be distinguished as office charges that more particularly excites attention. I observe, however, that in "J. T.'s" further communication on the subject, in your impression of the 4th instant, he says, "My first application was made through the West of England and South Wales Draining Company (who did the work for me under the inspection of their own engineer), in October, 1846." Possibly, therefore, the West of England Company may have something to do with the matter, and so relieve the Commission from the excess.
*J. H. Charnock, an Assistant Commissioner under the Acts. Wakefield, Jan.* 10, 1851.

## FAILURE OF CLOVER.

IN the autumn of the year 1849, it was mentioned to me by John Bell Crompton, Esq., an eminent agriculturist in the neighbourhood of Derby, that he had a fine first growth of Clover on land where it was in the habit

of failing. He asked my advice. I informed him that there existed no sovereign remedy for the cure of a disease which might originate in so many causes. After a description of the soil and information of the mode of treatment, I recommended rolling, and a top-dressing of salt and superphosphate of lime. For months more I heard nothing more about this particular case; but in the spring of 1850, Mr. Crompton sent me a sample of a soil, upon which healthy-looking Clover had suddenly and mysteriously died away. I was to examine it chemically, as far as I considered it to be necessary. I found the soil to contain as much as one-half of its bulk of finely-divided matter, consisting of finely-divided sand, clay and chalk, together with a proportionate small quantity of organic matters. Subjected to further tests, I found the amounts of several fertilising matters present in such small quantities as to be scarcely recognisable. And this was the case more especially with the sulphuric acid. I then thought it advisable to estimate quantitatively several of the constituents. An imperial pound of the dried soil contained:

| | | | |
|---|---|---|---|
| Organic matter | ... | ... | 80 grains |
| Gypsum | ... | ... | $\frac{1}{1000}$ of a grain |
| Common salt | ... | ... | $\frac{47}{1000}$ of a grain |
| Chalk | ... | ... | $177\frac{6}{10}$ grains |
| Bone-earth | ... | ... | $5\frac{576}{1000}$ grains. |

Inasmuch as qualitative analysis did not indicate any other reason for the failure of the Clover crop, I thought myself justified in attributing it, in this instance, to the want of sulphuric acid, and perhaps of chlorine. When we consider the amount of sulphur removed by a large crop, it must be obvious that this soil could not furnish it. I had every reason to believe that the practice of the former tenant, of using lime as the sole manure, had been the cause: first, of changing the physical nature of the soil; second, of removing its soluble constituents; and thirdly, of supplying a large amount of phosphoric acid. I was much gratified to find that my advice in the first instance was productive of success. The Clover on 6 or 8 acres (I do not remember which) did not only not fail, but an average of 2 tons per acre was obtained in the summer. And although the soils in the two instances mentioned here were some distance asunder, I know that the sulphuric acid of the superphosphate and the chlorine of the salt, were, chemically speaking, the cause of success. *Albert J. Bernays, F.C.S., Chemical Laboratory, Derby.*

## THE SHEEP.

A Village Lecture.

In its natural state the sheep is wild, shunning the haunts of men, having greater pleasure in bounding amongst the mountain crags, and cropping the scant herbage springing from the crevices of the rocks, than in frequenting the plains to fatten indolently on their luxuriant pastures.

It is supposed that there are three varieties of sheep, from which all others have sprung. They resemble each other in character, though not in appearance. The mouflon is found amongst the mountains of the wildest islands of the Mediterranean Sea; and the North American argali frequents the mountains of the country from which it derives it name. I shall point you to the third called the Asiatic argali. Well, this argali to us is a curious looking sheep. If that picture is a good likeness, I think we shall be inclined to say, "What a fine goat," for certainly it is more like a goat than anything else. We should be sorry to see such a fierce wild fellow as that amongst our flocks. Those long legs would carry him over our highest fences. His bones are large, his frame is indicative of great strength, and altogether, with his small erect ears, and long upright spiral horns, he is a very handsome, but certainly not a very quiet well-disposed sheep. His covering is a mixture of hair and wool, varying in quantity according to the clemency or inclemency of the season. The hair dashes aside the rain and snow, and the wool protects him from cold. During the summer months, therefore, you may see these animals dressed in long hair; but as soon as the cold winds prevail, and the snow falls, and frosts ice the waters, the wool spreads amongst the roots of their hair, and a warm covering is thrown around them. The argali usually run together in flocks of 10, and the females lamb twice a year.

We are quite unable to ascertain how long ago, or by what means the sheep was introduced into our country. Some Latin books, however, mention the British sheep when we were invaded by the Romans. That event, of which I told you upon a former occasion, took place about 1900 years since, so that there need be no wonder at our inabilities to date the introduction of this animal into England. It appears that the west of England was, at this period, more celebrated for its sheep than any other parts. The Romans established woollen manufactories, and seated them at Winchester, in the centre of the great western downs, on the borders of which, to this day, may be seen the remains of Roman buildings and sheep cots, and the long straight lines of Roman road that weary the eye of the traveller. These down sheep furnished a very fine wool, much in request for the manufacture of the finest cloths. It was for its wool at this period that the sheep was bred. Some time after this the improvement of the carcass was aimed at, but the quality of the wool suffered in consequence, and the manufacturers were obliged to seek for wool from other countries, where the pasturage is less rich. The wools clipped in this country, at the present time, for the same reason, cannot be worked up into the finer stuffs; but for all such fabrics foreign wool from Germany and Australia, &c., as you will learn when I come to speak of wool, has to be used.

To these downs, as far north as the Cotswold Hills, to which I now point you, this valuable breed of sheep seems to have been confined for a length of time, and the manufacture of cloth was consequently limited to the west of England. By reason of the abundance of fuel further north it has been removed to a position where it can be conducted with less expense.

The wooded and marshy nature of our country formerly rendered it unfit for the pasturage of the sheep, which could exist only upon the downs, and hills that were naturally drained and free from timber. But as the mighty forests fell beneath the axe of the woodman, and the land was relieved of its superabundant water, by a good system of drainage, the sheep sauntered down into the plains to taste of the fruits of cultivation. Some preferring the active life of the hills to the indolent existence of the plains, returned to their mountain retreats and scant pastures, whilst others willingly consented to remain and fatten upon food that should be prepared for them. With this change of habits and food comes a change of form, character, and constitution. The peculiarities of soil, situation, and climate produced corresponding peculiarities of form and habit; and it is with the varieties of this animal thus produced that we have now to do, under the two heads of upland and lowland sheep.

Of the upland varieties I shall first notice the southdowns. They receive that name because they frequent the great chalk downs to the south of England. From that representation of a southdown ram you will see that their shape is compact and round, their body full, their head fine and without horns. Their faces are remarkable for a mild expression, and they are famed for tractableness and gentleness. The fleece is close, extending under the belly to the hocks. Both their wool and mutton is much esteemed, and find a ready sale. They are prolific breeders, fatten quickly, and are only suited to the lighter soils. As mountain sheep they have naturally light fore-quarters; but this defect has been corrected by careful selection, and they now appear, by the same means, to have arrived at the highest perfection of form. The chain of hills and moors, extending from Derbyshire, northwards, is famous for the black-faced sheep. You will easily recognise the picture of the animal from amongst the rest before you. It belongs to the smaller class of sheep, is of compact form, with black face and legs, long spiral horns, an eye bespeaking wildness, and a coarse fleece. On account of its great hardihood, it is carried amongst the bleak uplands of Scotland, and is the only sheep that can endure the excessive cold of those mountains. The heavy snow storms are the chief sources of danger to the sheep, and of anxiety to the shepherd. I am told that when a storm comes on, these animals will all repair to the windward side of the mountain, and remain with their heads pointed to the quarter from whence it comes, during its continuance. As their pastures are bare, and no provision is made for them of artificial food, they are three or four years old before they are ready for the butcher. When marketable, however, they command a high price, owing to the venison flavour of their flesh. They are kept in large flocks, and need a great range of pasture, so that one or more shepherds with their dogs are required to be constantly abroad. The duties of a shepherd in those parts are very different therefore from those you have to perform. During the day he occupies the high ground; that affords him a view of the whole sheep walk. His dog is his chief and most useful companion A word or a look from his master sends him searching to the furthest range of the sheep walk. These dogs, when well trained, perform, with the most perfect ease, more work than could be done by 5 or 6 men. When the flock has to be "gathered," and driven to another quarter of the sheep walk, the dog, at a sign from his master, barking, circles the sheep, and they, recognising his signal to fall in, all scamper towards the centre of their range, and are driven towards the shepherd, who leads them to a fresh bite. The chief objection to the breed is founded upon the coarseness of its wool, and the Cheviot, of which we shall speak directly, is often chosen in preference to it, on account of its fine fleece. But for an elevated and rugged country, a healthy pasture, and a serene climate, the black-faced sheep is better suited than any other. When removed to a low, marshy district, this sheep parts with many of its peculiarities. It loses its hardiness, the colour of its face and legs becomes less dark, its wool less coarse, and sometimes its horns disappear altogether.

*The Cheviot sheep* derive their name from the Cheviot Hills, of which they are natives. That range of hills extends through the north-east of England, and the south-east of Scotland. The Cheviots are heavier than the black-faced sheep; they are without horns, the head and legs are white, and the eye mild. The body is finely shaped, though long; the back is straight, the ribs arched, the shoulder plate well thrown out, and the legs small-boned and clean. Their native hills are clothed with a pasturage inferior to that of the southern chalk downs; but it is considered good. Their wool is fine and short, and as a protection against the bitter winds that sweep through the dales, and the snow storms that whiten the mountains of the northern counties, it is thickly set. A heavy winter snow storm is no slight matter in the eyes of the flock-masters and shepherds of the Cheviot Hills. Nothing can be done during the continuance of the storm except to seek for self-preservation; but when its fury has abated there is work in plenty. The Cheviot is perhaps less hardy than the black-faced sheep; but its good qualities, its fine wool, delicately flavoured flesh, weight, and gentle character, give it a higher place than that animal in the consideration of sheep breeders.

Having glanced hastily at the most important of the mountain breeds, let us descend and make ourselves acquainted with the peculiarities of the chief varieties of sheep that enliven our plains.

You all know the *Leicester sheep.* Many of you know more about its management than I do; but perhaps I can tell you more about its history than you know. On your right are two pictures. They are both representations of the Leicester ram. "What a difference!" you say. It is true; and the difference may just show you the improvement which this breed has undergone within the last 70 or 80 years. Formerly, the Leicester was little esteemed, either for wool or mutton; indeed, it had few good qualities. What is called the new Leicester is now the most general and valuable variety of all the long-woolled sheep. This improvement arose from the attention given by the master of a single flock to the principle of selection. By this I mean that the most perfectly formed animals were every year selected for the purposes of breeding, until all, or nearly all the prominent defects of the parent stock were lost, and all its good points were strengthened and confirmed. The result of the experiment is, as you see, that from a very coarse animal wanting in all good properties, a very fine one, possessing very few bad properties, is produced; and this is, indeed, the surest method of improvement, where the defects of a breed are to be corrected without endangering those properties which especially adapt it to its situation. These, of course, must be retained, and therefore we see that attempts to improve a breed of sheep or any other animal, by crossing it with another, frequently prove failures. The new Leicester sheep is inferior to the old in size and weight. Mr. Bakewell, the improver of the breed, cared not, however, so much for size, weight, or wool, as he did for something else. He made himself acquainted with the external characters which indicate a disposition to fatten, and when he met with a sheep in his flock possessing such qualities, he put it aside. His aim was to obtain a sheep that would come in an early state of perfection to the knife, and great success has attended his efforts, since no class of sheep comes sooner to a state of maturity than the Leicester. The butchers dislike this sheep. The fineness of its bone causes it to weigh too well for the customer; and its fat is distributed all over the body, instead of being accumulated about the kidneys (as it is in the mountain sheep), which is a great disadvantage to them, since the "tallow cake," as you call it, fetches a higher price in the tallow market.

Yonder picture represents the sheep—I mean the *Old Norfolk*—and emboldened by the absence of a Norfolkman, I will show it off to the best of my ability. It was excellently well fitted for walking, racing, and jumping. Very few of the pure breed are to be seen now. Nothing could be done to improve it except the introduction of foreign blood into its system, for of its own it had no good qualities to be confirmed and rendered permanent by the method of selection. It was crossed with the Leicester and the Southdown, &c., and usually made way altogether for other breeds. Suited exactly for the formerly uncultivated waste of Norfolk, where long legs and agile limbs were essential to keep their possessor clear of bogs, and well supplied with pasturage without over fatigue, it is quite unsuited to Norfolk in its present highly cultivated and drained state; for, owing to its restless habit, it destroys more food than it consumes, and fattens very slowly, in comparison to the Leicester and Down sheep.

*The Sheep of Romney Marsh* are peculiar. The nature of their situation requires them to be very strong and hardy. Looking at the map you would perhaps think the county of Kent warm and mild, from its southerly position; and Romney Marsh, which is at the south of the county, a little raised above the level of the sea, you would expect to find one of the warmest spots in England. Kent, however, in winter is a cold county, and Romney Marsh is one of the coldest districts of Kent. These sheep have many privations to suffer, and much inclement weather to endure. The fields there are divided by dykes instead of hedges or stone walls; and when the autumnal rains set in, these dykes are filled to overflowing, and the land is soaked. The evaporation of all this water must take place, and the air is consequently charged with an unwholesome degree of moisture, and rendered very chilly; and we shall learn, when we come to talk about the diseases of sheep, that the rot which is caused by the wetness of land is the most fatal malady that they are liable to. Now, if rot should be found anywhere, one would surely expect to find it amongst the Romney flocks; but it appears that in consequence of these sheep being thoroughly inured, or, as I should say, naturalised, to the disadvantages and hardships of their situation, comparatively few suffer from this cause. The Romney sheep is destitute of almost all those qualities that the best judges consider essential to a good sheep. Some efforts were made to impart to it the better properties of other breeds; but with a bad result, since an animal was produced that could not endure the severities of the climate, and the principle of selection was resorted to as the only means of furthering the designs of the flock-masters.

*The Cotswold* is in its pure state a heavy, ill-made, narrow-breasted sheep. It derives its name from the

Cotswold Hills, running through Gloucestershire, on the table land of which it feeds. These hills are called Cotswold from the sheep cots built upon them by the Romans. Wold means wild, or height, so that the whole word means the wild or height of the sheep cots. Above the representation of this sheep is a plan of one of these cots, from which you will see that they were long houses, with several floors, reached by as many very gradually inclined approaches or walks from the outside. This sheep, though a ranger of the hills, belongs to the lowland class; and, furthermore, it is the first of the long-woolled breed we have noticed. The Cotswold is rather an important animal in history, I assure you, although such a mean inelegant-looking sheep. His fleece was exported, to be wrought up with gold by the people of Italy, and France, and Spain to sparkle upon the persons of their kings. For a length of time after the Romans left us, it was valued and bred solely for its wool; not on account of its fineness, but for its long staple, a property that rendered it better suited for the manufacture of light fabrics than the short wool. Mutton becoming an object to the sheep farmer, he looked about for means to improve this breed by increasing its fattening properties. About 50 years ago it was first crossed with the Leicester with very good effect. The bulk of the sheep was reduced, and its wool became of shorter staple; but all loss that has occured to the farmer in these ways, has been amply made up to him by the early age at which these animals come to perfection, and the quick return of his money.

*The Devonshire Long-woolled Sheep* resemble those of Romney Marsh, except in the colour of their head and legs, which are brown. The pure breed is remarkable for nothing save an ungainly, rambling body, and a long coarse fleece. The Leicester cross has, however, been very serviceable to them.

*The Sheep of the Devon Moors*, like the Devon Moors themselves, are wild, ranging, dark, and stunted as the stunted herbage upon which they endeavour to subsist. The wethers are left to weather the winter as they best may upon those bleak barren moors, but the ewes are protected during that season by stone enclosures. So great is the wear and tear of body these sheep are obliged to sustain in obtaining a scanty living, that they are frequently shorn nine times before they are brought to market. The Leicester has likewise improved this breed.

*The Old Lincoln Long Woolled* are not the handsomest sheep in the world. The mountain life would make them like so many bags of bones. They could never support the fatigue occasioned by the long walks and fearful jumps that the mountain sheep are compelled to make, in search of food, and for which God has fitted them, by the gift of agile limbs and light frames. But for his native marshes, where the pastures are rich, and he has not many steps to move before his appetite is satisfied, the Lincoln is very well suited. The mountain breed, by reason of the great quantities of food they would damage by their restlessness, would be as much out of place in the marshes of Lincolnshire, as would the Lincoln amongst the uplands of Scotland. The Leicester and Cotswold have both been crossed with this sheep, much to its advantage. Their fleeces are heavier than the Cotswold, and the staple is longer.

*The Dorset* is a small and rather pretty sheep. Its head is horned. It is hardier, although rather coarser than the Southdown. Being quiet it is found very useful as a folding sheep—thus manuring the high lands when it would be impossible to cart yard dung. The ewes are remarkable for their forwardness in lambing. Their lambs are usually ready for the Christmas market, when lamb appears only upon the tables of the rich, who are made to pay a high price for their good taste. To lengthen the wool of the Dorset, and increase its size, crosses were tried with the Leicester, but to no purpose, since more good qualities were displaced than imparted. The fleece only weighs from 3 to 4 lbs.

*The Welsh Sheep*, or those now feeding in that country, have been principally introduced from England. The natives of those mountains resemble the goats as nearly as we said the Asiatic argali did, and are excessively wild. They vary in colour from black to white. Their wool differs in quality, and is fine and coarse according to their pasture—they fatten very slowly, but their mutton is much esteemed. We have, I think, looked at all the principal varieties of British Sheep, and noticed the points wherein they differ from one another. We see how they all take their character from the soil, the climate, and the situation, and how dependent they are for their form and constitution, and properties, upon circumstances over which they can have no control, even as we are ourselves. The intelligent traveller may obtain much real knowledge of the agricultural condition of a country, by a quiet observation of the sheep, as he passes by upon the high road. You could know as well the character of the soil of a particular district, by looking at the sheep that were reared upon it, as though you were to turn it up with a spade for yourself. We shall have you walking about with quick eyes now, and when you detect a sheep like the Old Norfolk, you will say to yourself, "This land sadly runs to waste, why is it not drained and properly done by; the folks are much to blame? It is wonderful how much labour our eyes will save us when properly used. Take a bit of earth to some men, and they will tell you what kinds of earth and stone lie underneath it for hundreds of feet. Pluck a weed and send it with its roots to others, miles away, and they will tell you all about the place from whence you took it. And why may not you learn to know of things beneath, by those you see above? Then what would you think of a blind man going to *look* over a farm? Yet by judicious questions, and by learning the names of the very weeds upon the land, he might know as much about the nature and condition of the soil as you will.

## Home Correspondence.

*The Drainage Act.*—In complance with your call to "speak out" to "any one who has had a more favourable experience of the administration of the Government loan for drainage," than one of your correspondents would seem to have had, I have very great pleasure in stating that my experience of it has been most satisfactory in every respect. I have lately had 250 acres of my glebe drained under the Act. The total charge of the Inclosure Commissioners for their expenses, amounted to the sum of 21*l.* 11*s.*; and this very moderate sum was allowed to form a part of the amount to be charged on the estate. The Inclosure Commissioners, who were very far from raising any obstacles, or need less delays, sent one of their inspectors for a final inspection, as soon as it was announced to them that the work was finished; and very soon after, I cannot easily refer to dates, but so soon, I think, as it was possible, allowing a reasonable time for necessary explanations, and a due consideration of his report, the money was advanced, and the charge completed. As your correspondent has alluded to the "West of England Land Drainage Company," I will add that I also entrusted the whole contract of the business to them, and that I have had no reason to regret it. Their charges are moderate. The attention of their directors and engineers was unremitting from first to last. The work was executed most rapidly—a very important consideration—and in so perfect a manner, as to command the admiration of all who saw it. *T. A. Strickland, Bredon Rectory, Tewkesbury.*——Your correspondent "J. T." of Swansea must have omitted some circumstances which would fairly account for the delay in payment of his 400*l.* from the Drainage Commissioners, and also for the amount of charge made by them for inspection, &c. Perhaps the absence of railways, or difficulty of access to the ground, may have raised the expenses of the inspector, and, no doubt, the per-centage upon a small sum will be greater than upon a large amount. From the middle of 1847 to the present time, I have been engaged in draining under the loan of 1846-7, and have never found any difficulty in obtaining any periodical advances within a month of the time I wished for them, while even that trifling delay has been occasioned by the unavoidable engagements of the inspector. Within a fortnight of the time, when he sends in his report, the treasury cheque invariably arrives. The total of my deductions are now under 3 per cent. upon the sum advanced, and at the last advance they will barely exceed 2 per cent. upon the whole. The amount of letter writing complained of, is entirely in the hands of "J. T.;" one letter to the commissioners asking for a form of application, and the return of that form properly filled up, is quite sufficient, but the neglect of the instructions in that form will, of course, entail additional correspondence. *L.*

*Farm Capital.*—In an article on "Farm Accounts," in the *Agricultural Gazette* of the 4th inst., I observed the following paragraph with regard to the amount of capital required for the cultivation of a farm of 100 acres in extent:—"It may be right ere we close this somewhat lengthened introduction, to enter upon, &c." Now, may I first ask the question, why does "F." fix on 10*l* per acre, as the amount of capital with which he is to meet the first year's expenses? The opinion of one farmer or another would be nothing with me in a case of this kind, unless the one or the other had seen the farm and valued the first year's expenses with the utmost scrutiny. If "F." takes the trouble to value every expense which it is necessary to incur during the first year, and which must be paid by drawing on his capital, he need not fear the criticism of anyone, as he may at all times reply, "Value my first year's expenses, and if they can be got through for less, I shall be glad to spare the money." Very few would, I think, undertake to make a calculation, and many of them would probably find themselves very much out if they did—provided "F." has exercised that strict economy which is necessary. It is no uncommon custom amongst some of our best farmers to *guess* at the amount of capital required for entering a farm, and even though they have never seen the farm or been within 30 or 40 miles of it, they do not scruple to practise such a blind policy. Of course nothing can be so vain as to suppose they can tell within a great deal the actual amount required, more especially as the expenses of the first year are so very various and numerous. The number of small items which run away with small sums, like eighteenpences, half-crowns, crowns, and half-sovereigns, are almost incalculable, whilst many of these small items are as important as some of the larger ones. If "F.," in some of his next articles, would lay down a concise method of valuing one's first year's expenses, and give a few arguments in favour of such a practice, he would confer a great favour on your readers. I subjoin a list of expenses which appear to me to require consideration upon entering a farm, viz.:—rent, rates, tithe, taxes, interest of money, valuation of covenants, one year's labour, whole amount of dead stock, whole amount of live stock, furniture of house, all expenses connected with housekeeping, and for a few household repairs to be done on entrance (that are to be done inside); some allowance should also be made for a few repairs or alterations made in concert with the landlord. *J. R. M.*—[We think your criticism is premature: wait till we see how "F.'s" plan developes itself.]

*Brewing.*—In March last, in your journal, "Barleycorn" furnished a capital process of brewing. If he be still in a kind vein, I trust he will satisfy my enquiry. I have sometimes difficulty in procuring sound yeast. Has "Barleycorn" ever tried German yeast? an article which finds its way to London twice a week from Hamburgh, and a most capital one it is for baking bread, but I desire to know if it be equally applicable to the production of Barley-wine. Is rain water objectionable, which has stood for some time in cask, and become rather sewery or Londonised in its character? "Barleycorn" advises in brewing that the temperature in mashing be not allowed to rise above 170°; for above 170°, you get gum, and not sugar, and if the mash fall below 140°, you run risk of acidity. Will he be pleased to give me the rationale of this? *A. B.*

*Poultry.*—Your correspondent (Mr. Kidd, Hammersmith), must be wrong in giving Sir John Sebright as the author of the tale about the wild ducks; the late worthy baronet well knew how to perform the operation of pinioning, so that the feathers could not reappear; out of respect to whose memory I take this opportunity of correcting Mr. Kidd, and to tell him that in pinioning a bird, that part of the wing called the pinion, and containing the 10 flight feathers, is cut off. *H. Hottimon.*

*Flax.*—There appeared in a recent Number of your Paper a notice of an invention by M. Clausson by which the tedious process of steeping was avoided in the preparation of Flax for the market. Have any particulars of this valuable discovery transpired? and is it of so cheap a nature as to be of any advantage to limited growers? Many publications and some names of high agricultural authority, have of late rung the praises of this plant. A statement of Mr. Warnes's, which appeared in the *Morning Chronicle* some time since, was particularly cheering to farmers whose lands are favourable for its cultivation. According to him (Mr. Warnes) a profit of 17*l.* an acre is realised; a profit it is needless to say no one, under the most favourable circumstances, could expect from Wheat. But as Mr. Warnes may be so happily situated with respect to the growth, manufacture, and sale of Flax that a large per centage will have to be deducted to suit less favoured districts, still I think it is a crop from which the farmer may reasonably expect a fair remuneration, because he shall not have to depend on the fibre alone to pay him, he will also have the seed, so valuable as a fattener and enricher of manure. *Anon.*

*Agricultural Improvement.*—To point out all the numerous errors in agriculture would indeed be an onerous and almost an endless task; and having alluded to a few of the most flagrant, I will now attempt the more agreeable duty of endeavouring to suggest some means of improvement. In my last paper I alluded to the importance of agricultural education, as a means of promoting improvement. The want of such education has been one of the greatest impediments to agricultural progress; for if we examine the various improvements which have been made within the last century, we shall find that hardly any of them have originated with uneducated men. On the contrary, nearly all of them have been the suggestion of educated persons, though many of them had not been brought up as farmers. And here I beg to correct a misprinted word in my last letter. At page 779, for "crime" read "curse." It should be, "but in all education, moral and religious principles should be inculcated; without these it will prove a curse instead of a blessing." We must not consider it criminal to promote education, though the want of right principle may cause it to be perverted to criminal purposes, and thus it may prove a curse instead of a blessing. Now since it is evident we cannot go on in the old way, let us consider what improvements may probably be made. First then, with regard to the size of farms and their arrangement; I would suggest that when the nature of the land is suitable for alternate tillage, and the house-feeding of live stock, the farm should not exceed one or two hundred acres, with the farm-stead nearly in the centre. If larger the distance from the homestead is too great for the carting of green crops, and solid and liquid manure. Indeed it is astonishing how much stock and crop may be raised on even a much smaller farm, when the land and manure, liquid as well as solid, are made the most of. Instead of only half managing 200 or 300 acres let the farmer try if he cannot, by deep and perfect cultivation, raise as much or more produce on half that quantity. To do this is frequently quite practicable, as it has been proved to be in numerous instances. But then there must be no neglect, no loss of time, or waste of anything, as we so commonly see there is, even on farms above the average state of cultivation. But there is other land which is unsuitable for cultivation that ought to be kept in pasture or meadow, and if the farmer has capital enough, he may very properly occupy a portion of such lying at the outside of his little ring-fence farm. Such land would be very desirable for breeding stock, which should be kept out of doors as much as may be, as the animals would become tender by being much housed. There is a great deal of pasture and meadow land that is capable of being profitably improved without ploughing. For instance, there is a stream of water which a large proprietor, or a number of smaller ones, or even well secured tenants might turn into higher ground, so as to irrigate some hundreds or thousands of acres. And even if the water

be not of good quality for irrigation, means may be used to improve and qualify it. How very beneficially a very small quantity of water might be applied immediately after a slight sprinkling of guano, nitrate of soda, or other hand manure, on such Grass land. A light dressing of quicklime has sometimes done wonders in improving the herbage on moor land, and yet these and similar easy means of improvement are sadly overlooked. Then that stream of water might be advantageously employed in various other ways, particularly in its application to machinery. It would frequently be profitable to erect either a water-mill or a steam-engine of small power at the homestead. Then again, the English farmer may take a lesson from the gardener, and another from the Belgian farmer, and even from the manufacturer. From them he may learn that it is oftentimes profitable to cultivate two soils, an upper and a lower one, in each field, instead of only half cultivating a shallow surface soil. He may, by first cultivating the subsoil, and partially mixing it with the upper soil, afterwards raise this mixed subsoil to the surface, placing the original top-soil below it, and thus have a fresh soil and one or two good crops every year, instead of two bad ones in three years, as is still the case on some farms. Or the soil may be dispersed and mixed with the subsoil by digging a trench in each furrow, and casting the earth over the land. In some cases this might be a substitute for under-draining, but that should on no account be neglected where needful and practicable; and where the drains are deep, this kind of semi-spade culture may occasionally be profitably adopted. Labour is the source of wealth, and land is grateful for it when applied judiciously. These are truisms sadly overlooked by most farmers. They practically contradict what they verbally allow, that if land will not pay for working well, it cannot pay for working at all. Some gentlemen, it is true, have been injured by an extravagant and injudicious expenditure; but experience convinces me that a very large, yet judicious application of labour on a small quantity of land is far more profitable than the same amount of labour on double the number of acres. Let the landlord and farmer then work together and take the benefit of labour, while it may be procured at a reasonable rate; for a time may come, and that soon, probably, when the labourer's work will be more appreciated and his services better paid. The progress of improvement in the arts and agriculture will, as I confidently believe, very soon promote such a change. This is an age of progress, and the condition of the labourer must improve, or the country's weal will be overturned by his depression, or oppression more properly speaking. It is good policy, as well as humanity and justice, to promote the morality, independence, and comfort of the industrious poor. Let honest industry be freely encouraged and liberally remunerated; it is a compound virtue, more precious than the costliest pearl, or the most brilliant diamond. When prices were high, cultivation might be low, and still profitable; but now that prices are low, cultivation must either be high, or it must cease altogether. Poor crops and low prices are ruinous; if the price be low, the crop must be good both in quality and quantity, and that cannot be expected without skilful cultivation. Such cultivation may probably in a considerable degree provide remedies for those casualties which are frequently so injurious to farmers who manure highly, but do not in some respects act judiciously. A little practical study of chemistry and botany may probably tend greatly to strengthen the straw and promote other safeguards. There is much land which, with low prices, will not pay for constant cultivation, but which might be profitably improved as pasture ground, and by occasional cultivation at more distant periods, and of a superior character. My aim is to impress both landlords and tenants with a sense of the imperative necessity which now exists for mutual co-operation, so as in every way to make the most of the land. Very considerable improvements must now be made, or cultivation must be completely abandoned; and these improvements cannot be effected without the co-operation of both parties. Even if the delusive hope of a restoration of protective duties, on which some seem still to be relying, could be realised, even then, agriculture could not be permitted to stand still, it must advance with the age; it cannot be that the oldest and most useful of the arts shall remain comparatively stationary, while everything else is making rapid progress We have now great difficulties to encounter, and without superior efforts and improvements they cannot be surmounted, but by them we hope they may. *O. F.*

* *My Poultry House* is a brick building; the walls are about 6 feet high; the slate span roof is thatched inside; the internal walls are 4½ inch brickwork, which divide the house into compartments, 12 feet long by 6 feet wide, to each of which is attached a yard or walk of the same dimensions. Each room is rendered rat proof by a slate floor, worked wire over the window, and sheet iron on the door. The floors are covered with a thick carpet of sawdust. Each room of these dimensions affords ample accommodation for a cock and six hens, with laying boxes and self-supplying feeding-trough, and allows space for a small pen or two where hens may incubate, without being disturbed by others, or it is large enough for 12 full grown chickens which do not require the boxes and pens. Perhaps "W. H." will think the space allowed is small, but he will find that if the floors of the house are raked over in the morning, and the walks in the evening daily, and fresh sawdust in the house, and sand and gravel in the yards are laid down frequently, the fowls may be kept in health and high condition. The quantity of manure I collect from the droppings of about 36 fowls is surprising. I conclude that every amateur gardener is aware of its value. *Penzance.*

## Farmers' Clubs.

EXMINSTER, *Dec.* 30.—The principal object of the meeting was to hear a lecture from Dr. Bucknill on the most economical method of using manure (not artificial) on farms. Dr. Bucknill commenced by observing that he had been reading a book of travels in Canada, in which, curiously enough, it was shown how the agriculturist might best "dispose" of his manure, as if manure was a thing to be disposed of and not carefully used. But this book of travels related that the Canadian farmers, when they could, constructed a platform on a river or stream, overhanging its banks; on this platform the manure accumulated, and during floods it was shovelled into the river—that was one way certainly of disposing of manure. Since that he had read a book of field sports in South Africa written by Mr. Gordon Cumming, who states that the English agricultural colonists who have immense flocks of sheep, and herds of cattle, are in the habit of confining them in a kind of yard called a kraal; there large heaps of manure accumulated, and this being dried in the sun is used as fuel—the farmers there burn their manure, which was another way of disposing of it. If they came nearer home they would sometimes find cases in which the manure was disposed of not altogether in the bulk, and at once, as by the farmers of Canada and South Africa, but where its valuable properties were nearly as effectually wasted. In England they sometimes found large farm yards partly surrounded by waggon sheds, stables for a few horses, stalls for a few oxen, and standing for cows—none of the roofs provided with gutters, and in the centre a depression on which the manure made is deposited from time to time. This depression communicates in a number of instances with the road in a very convenient manner to carry off all superfluous matter, and after a heavy rain all the water which has fallen in the yard and from the roofs, first saturates the manure heap, and then in the shape of a thick black portery-looking liquid makes its way down the adjoining roadway, into the nearest brook or river. Thus all the soluble salts, which the manure contained, were washed out. The manure itself was much of it scattered across the yard exposed day after day to the winds of heaven, until all its volatile particles, those fugitive essences, which were the farmer's best friend, his good genii when kept, but which have always a tendency to fly away, were dissipated. They passed into the atmosphere, fertilised the rain which fell on the land, but a most infinitesmal dose was returned to the farms from which they had escaped. He thought they would agree with him that on such farms as that they were nearly as successful in disposing of their manure, as in Canada or South Africa. But the question was not how to dispose of the manure, but how to save it—he would therefore examine the principal evils of the different systems. The evils resulted themselves into the want of management—feeding carelessly or badly—neglect of the soluble and liquid portions of the manure, and want of due precaution in fixing and bottling up so as to catch and reclaim that volatile essence which they all knew by the name of ammonia. First, as to the general principles of feeding. The old system of feeding had of late days had most vigorous and presumptuous rivals. There was the system of feeding on boards, advocated by Mr. Huxtable and Mr. Mechi—he did not pretend to know what advantage that system possessed in making manure, except that it saved litter, and this litter was consumed for fodder, which certainly was worth their consideration. Another system, and one which deserved their attention, was that of feeding in boxes; he must own, both from personal observation and from what he had heard and read, that he believed this system of box feeding, where there was plenty of litter, was by far the most economical and most judicious mode of feeding beasts. The principle is that of confining the animals, each in a sort of box, supplying them, from day to day, with plenty of fresh litter, which they trample under their feet, and never removing it until it accumulates to a certain height, and becomes a solid, compact mass. The continued trampling of the animal makes it so solid that air cannot penetrate, and fermentation does not therefore take place. The urea in the dung is not converted into an ammoniacal salt, and the mass of dung, urine, and litter, is all mixed up in a solid cake, and remains, at the end of many months, in an unfermented condition. Now, when they remembered that fermentation was the conversion of the urea, in the dung and urine, into a volatile salt, and that this volatile salt had always a strong tendency to escape, do what they would with roofs, sheds, or covering it with gypsum, they would see the importance of a method which prevented fermentation, as did the box system of feeding, known as Warnes' system. Although there had been many objections made to the system, he believed that the success it had met with in Norfolk and other counties, where farming was carried on in a very skilful manner, was the best practical answer to objectors. But the box system was not general—a great majority of farmers had no boxes. There was another system very prevalent—that of feeding in loose stalls, tying the animals by the head, and removing the dung when it had accumulated. That system being a general one, and not entirely wrong or contrary to any obvious philosophical principles, required some consideration. It required much greater care than the system of box-feeding, to prevent fermentation. Directly the dung of an animal was dropped, it began to ferment, if exposed to the air. There was no ammonia in the dung or urine of a healthy animal when first passed; it was then in the condition of nitrogen—in what chemists called a state of urea or urates, but as soon as it was exposed to the air it began to undergo a chemical change to a salt of ammonia, principally the carbonate. The dung of a horse would ferment in 24 hours, and if put in a heap, in a fortnight or three weeks would lose seven-tenths of its weight—a most astonishing loss. Having these manures, how then, was the question, could they best prevent the loss of the ammonia by fermentation consequent on exposure to the air. There were many plans to prevent—of course it was highly necessary to make it into a solid compact well shaped heap, and if they had more liquid manure than the heap would absorb, it should be conveyed to a tank or depression in the ground, from whence it could be thrown over the heap as required. There were also many sorts of absorbents which could be mixed up with the dung, and which would to a great extent prevent its rapid fermentation. Of these, the one which appeared to be of the greatest importance, was peat charcoal, a patent for the preparation of which had been taken out by Mr. Jasper Rogers. Peat charcoal, of all substances, perhaps had the greatest affinity for ammonia. He firmly believed that if it could be sold at a reasonable price, it would become an article of great importance to farmers. Another absorbent was gypsum, which he (Dr. Bucknill) used to a considerable extent. Gypsum when in contact with carbonate of ammonia in a liquid state, underwent decomposition, the carbonic acid in the carbonate of ammonia in a liquid state, underwent decomposition, the carbonic acid in the carbonate of ammonia united with the lime in the gypsum, setting free the sulphate, which combined with the ammonia, and formed a sulphate of ammonia. Sulphate of ammonia was a fixed salt, and when the farmer had got the ammonia united with a sulphuric, instead of a carbonic acid, he had but very little difficulty; it was soluble, and might therefore be washed away by the rain, but was no longer volatile. Next to peat charcoal, gypsum was therefore the most valuable ingredient to retard fermentation, and to hold fast the ammonia. Then Professor Way had made some important experiments and discoveries. He found that if he filled a tube with any loamy earth containing clay, and filtered liquid manure through it, it parted with all its manure qualities, and came out plain water. He thus found that clay will abstract from manure all its ammoniacal salts. Now, they knew the why and the wherefore of this peculiar property of clay, they would be enabled to take advantage of it with much greater effect than before. They also now saw how it was, that great benefit was derived from covering over heaps of manure with clay, or with earth containing clay. If they took three portions of liquid manure from the same tank, and mixed one with clay, another with sand, and left the third alone, they would find that portion mixed with sand stink first, that left alone the next, whilst that mixed with clay would remain for many months without change. He would next touch on liquid manures—the best mode of applying them, and the reason why liquid manures so frequently failed, and point out the way to apply them, so as to obtain the most beneficial result. When they remembered that a cow passed more than 300 gallons of urine in the course of four months, that the weight of the urine from animals usually kept by farmers is double that of the dung passed by them; and when they also remembered that taking weight for weight—taking a pound of the urine of the cow against a pound of the dung of the cow, the urine contained a greater portion of ammonia; so that it was more valuable, and that the same was the case with the horse, they must see the importance of attending to liquid manures. Dr. Thomson had stated that 9 lbs. of urine were equal to 20 lbs. of dung. Boussingault had found, by experiment, that 100 lbs. of good farm-yard dung produced the same result as 125 lbs. of cow-dung, or 91 lbs. of the urine of the cow, or 71 lbs. of the urine of the horse. In experimenting on the quantity of nitrogen, he found in 1000 lbs. of the dung of a cow, 3¼ lbs.; in 1000 lbs. of the urine, 4½ lbs.; 1000 lbs. of the dung of a horse, 5½ lbs.; and in 1000 lbs. of the urine of the horse, 26 lbs. Nitrogen, as he had said, was the basis of ammonia, and by fermentation it became a salt of ammonia; they therefore saw that the urine of the cow contained one-third more nitrogen than the dung, and the urine of the horse contained 26 lbs., whilst the dung contained but 5½ lbs. So that, in the first place, urine was more valuable, on account of its greater bulk; and secondly, it was more valuable because, bulk for bulk, it was capable of producing more ammonia than dung; they might then come, without difficulty, to the conclusion that it was most wasteful to neglect saving the urine of animals. Another question was, whether they should keep the liquid manure separate from the solid? He believed that it was most desirable to keep it separate, or to have a separate provision whenever the quantity of animals was so great that the litter was not sufficient to absorb it. If there was sufficient, no doubt the absorption of the urine by the litter was the easiest plan, though, in a majority of cases, he believed the litter would not be sufficient. A single cow passed 1000 gallons of urine in a year at least, and it would take an immense quantity of litter to absorb the urine where a number of beasts were kept In such a case, he considered the best plan was to conduct the liquid manure to a tank—and this brought him to the tank system. Many persons advo-

cated that system, and stated that they had found it to answer; many other persons, on the contrary, who had had tanks built, had found them fail. What was the cause of this failure? He thought that it could be principally ascribed to two reasons. First, that the liquid manure which was allowed to pass into the tank was not pure, nine-tenths of it was rain water which had fallen in the farm-yard, and from all the buildings which had surrounded it. If they allowed 40 inches of rain to fall in the course of the year—he was not speaking from actual knowledge, but he believed he was under the mark, as 19 inches had fallen at Chiswick in four months; but taking that amount, there would be more than 4000 tons on an acre of ground—and as many farm-yards were more than a quarter of an acre, they would receive 1000 tons of rain water, which would be mixed with the manure and urine. If that liquid which was called liquid manure, thus got into the tank, was carted over the farm, and expected to produce a great result, he need hardly tell them that their expectations would fail. But where there was a well-constructed tank, in which liquid manure only was received, which was used on a grateful soil, which had been first well drained, and was capable of giving back a grateful return for benefits received, he believed there would be no failure. This led him to the second cause of failure—namely, that it was frequently applied to land which was undrained, the pores of which were already overflowing with moisture, and could not receive the liquid, which the first shower of rain swept off. But if the urine was properly saved and conducted over the land, whether by cartage, by pipes, by hose, or any way, he had no doubt that it would well answer. He had no reason to doubt the accounts which had been published of its effects in the neighbourhood of London and at Hounslow, where a great stable keeper had produced wonderful results. He had himself seen its extraordinary benefit in clay soils, where it should be applied to the ground, and not to the crop, and in the winter, or early spring, because clay soils had the facility of retaining and holding fast the ammonia. When liquid manure was applied to clay soil, it should be allowed to ferment, and that they might throw into it dead dogs, cats, or any other animal matter, and let it undergo the putrefactive process. But if it was applied to sandy soils it would be far better to use it in the spring months, when vegetation was first making its vigorous efforts; and when applied to pasture land, or to Italian Rye-grass, it should be as fresh as they chose, and he could assure them that it would answer every expectation. Another point sometimes mooted was whether it was desirable to have their manure heaps under covered sheds or not. He believed that if they wished to carry out the manufacture of manure in the most skilful and the most careful manner, they must have a roof, as they had in the northern counties; but a roof in the hands of a slovenly or unskilful agriculturist, not fully competent to manage the fermentation, might be productive of evil. Unless they were careful the heap when roofed might undergo a violent fermentation, and the heat would drive off the ammonia—the liquid manure should therefore be received in a tank, with a pump and hose attached, that it might be pumped over the heap to keep it cool and retard fermentation. The heap should also be covered over with clay, soil, hedge scrapings, hedge parings, and any other absorbents, which should also be mixed up with it if necessary. Supposing the farmer had neither tank nor manure shed, what was to be done? Supposing he even had to work with one of the worst yards, without gutters to the buildings or any conveniences, could he save his manure? He thought he could better than was often done—of course the good workman worked the best with good tools, but he worked better with bad tools than the ignorant or the slovenly. He would have a dry level spot for his heap, and make the bottom water tight by puddling it with clay; he would also protect it from the droppings of the roofs. Here he would cart his manure in a compact form, consolidate it by carting it down, mixing with it all the absorbent materials he could get. He would thus bring it to as solid a mass as possible, somewhat like its condition in Mr. Warnes' boxes. Then the distillation of liquid manure from the sides and bottom of the heap, he would catch in an open drain, and conduct to some convenient depression in the earth, made water tight, and from hence have it scooped back and thrown over the surface of the heap. He believed that this management was very common, and that it was the general way in which, under great difficulties, skilful farmers managed their manure, and he could only regret that skilful farmers should have to work under such difficulties. There were many other questions which time would not allow him to go into; there was one very important question—how the richness of the manure was affected by circumstances other than those he had mentioned—for instance, how by the food the animal consumed. Now they knew that manure was the balance left of the consumption of food, the residue from that which was required for supplying the animal economy, including what was burnt off in the lungs. If the food was rich in nitrogen, the manure would, of course, be rich. Vetches, Peas, Beans, and all leguminous plants were rich in nitrogen, and consequently the manure from animals fed on these substances was warm and rich, and apt to ferment. Another important point was the presence of the phosphates, one of those portions of the soil which it was difficult to prevent passing off, and which must be returned to keep up its fertility. It had been shown, that by giving animals bran, they would return much of the phosphate in their manure, as the phosphatic salts resided, not in the grain of the Wheat but under the husk. Then again, whether the animals were young or full grown was important—if they were young, they were adding the phosphate to their bone, and the nitrogen to their muscles and cellular tissues—young animals, therefore, made poorer dung than old ones. Animals fattening also made richer dung than animals getting into high condition. Animals in a stall, in poor condition, added to their muscles, and that robbed the manure of its nitrogen, but, in adding fat to their frames, they did not require the nitrogen. Again, if animals have any other excretion which is rich in nitrogen, their manure is poor—for instance; a milch cow requires a great quantity of nitrogen, the dung of a milch cow, therefore, is much less valuable than that from a fattening bullock. Another curious fact was, that in worked animals, the urine became richer and the dung poorer; the droppings from a working bullock were always poor. There was another branch of the subject which could hardly be gone into that night, as to the method of using manure; it was a very extensive subject, but one point could hardly be omitted—whether it was most desirable to use manures in a fermented or unfermented state—whether it was desirable to allow them to ferment, to get all the urea converted into carbonate of ammonia, or employ the manure unfermented, and allow the fermentation to go on within the soil. It seemed that this point had been a good deal discussed of late, and that a great many persons, including Professor Way, thought it far more desirable to use the urine fresh—that the loss experienced by the fermentation out of the soil was far greater than that experienced by its fermentation in the soil, especially if the soil be loamy or contain clay. He concluded by observing that on this and the other points he had touched on, he should be glad to hear the opinions of the practical farmers in the club.

METEOROLOGICAL REPORT.—Dec.—Jan.

(*Continued from page* 29.)

| Date. | Time. | Max. | Min. | Wind, and Remarks. |
|---|---|---|---|---|
| Dec. 23 | 7.30 a.m. | ... | 30.40 | N. Fine day and frosty. |
| | 10.20 a.m | 30.43 | ... | N. gentle breezes. See Dec. 20—22. |
| | 7.10 p.m | 30.41 | ... | Calm almost; clear and frosty. |
| | 10.50 p.m | ... | 30.39 | Do.; beginning to thaw. |
| 24 | 8 a.m | 30.34 | ... | Calm; mild cloudy day, wind. |
| | 10.20 p.m. | ... | 30.02 | W. Moderate, but increasing |
| 25 | 5 a.m. | ... | ... | W. Hard squall for about 20 minutes. |
| | 7.40 a.m. | ... | 29.92 | W. Heavy bank of clouds sinking to E. |
| | 11.30 p.m. | 29.99 | ... | W. Light winds throughout this day. |
| 26 | 8 a.m | ... | 30.05 | WNW. to NW. Light winds |
| | 10.40 p.m. | 30.10 | ... | and thin clouds with blue sky, and a mild day. |
| 27 | ... | 30.10 | 30.10 | NW. Calm, dull heavy day, but very mild. |
| *28 | 9 a.m | ... | 30.21 | NW. Calm morning, and bright blue sky. |
| | 11.10 a.m. | 30.22 | ... | NW. Warm sunny day. Barometer rising. |
| | 2.30 p.m. | 30.22 | ... | The barometer flat, having ceased to rise, and dark clouds passing slowly. |
| | 9.20 p.m. | ... | 30.22 | N.W. Bright starlight, thin clouds. |
| 29 | 8 a.m. | 30.18 | ... | W. Moderate breeze, cold drizzle a.m., and |
| | 10.10 p.m. | ... | 30.03 | W. overcast the whole day. |
| 30 | 7.15 a.m | 29.98 | ... | SW. Moderate breezes, in- |
| | 9.20 p.m. | ... | 29.85 | creasing towards night: overcast, clearing off p.m. |
| 31 | 11.30 a.m. | 29.73 | ... | SW. Blowing a gale all day and night, and barometer falling steadily. |
| Jan. 1 | 3 a.m | ... | 29.54 | SW. Blowing a gale all day, |
| | 1.50 p.m. | 29.64 | ... | with squalls and rain, and |
| | 6.45 p.m. | ... | 29.60 | a very rough night, but wind less violent. |
| 2 | 9 a.m. | ... | 29 62 | SW. Wind moderating a little, |
| | 9.40 p.m. | 29.72 | ... | but squally and rainy all day. |
| †3 | 4.20 a.m. | ... | 29.81 | Calm and hazy. |
| | 9.30 a.m. | 29.85 | ... | NNE. Gentle breeze and heavy rain. |

* This storm must have come from the Bermudas across the South of Ireland, and Central Germany. It was of large area, and travelled slowly.

† This storm came from the Azores (judging from the incessant rain), travelling slowly: it crossed the South of England, and the German Ocean.

Dorchester, Jan. 13th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

### JANUARY.

Somersetshire Farm, *Jan.* 12.—Having been two years on a farm in the neighbourhood of Glastonbury, in this county, and afterwards a year in the Wold districts of Lincolnshire, I wish to give my experience of the two systems pursued, by way of comparison, and afterwards a short account of the farming in this neighbourhood (about 12 miles from Bristol, on the west coast of the county). The first thing which struck me on my first visit to Lincolnshire was the great neatness of the hedges, the cleanliness of the land, and the quickness and precision of all the out-door work performed; no stopping being ever allowed till the dinner hour of the men, so that I think the higher rate of wages allowed, as compared with Somersetshire, well bestowed. With respect to drilling corn, in the former country, from 10 to 12 acres are performed per diem, in the latter seldom more than 7; in ploughing, an acre per day in the former, in the latter ¾; but this is perhaps hardly a fair comparison, as the difference of land must be taken into account, also the custom of permitting the men (in this county) to stop for much at 11 forenoon, at which half an hour is often spent; still we think the Lincolnshire ploughman would have the advantage, always working with a pair of horses of a quick, blood description. In harvest time all corn is mown in the former county; in the latter, although the use of the scythe is gaining ground, reaping is more prevalent: much is to be said on either side. Mowing is undoubtedly the quickest way, but it leaves longer straw for leading away and threshing, as well as in standing out in the fields, being more cumbrous: they always tie their Barley; and Oats, which is decidedly better than raking it up loose like hay, which is often done. Now, with reference to keeping beasts in loose yards on long straw, a common practice on the Lincolnshire Wolds, we may contrast the Somersetshire farmers favourably, for the straw is always cut; often, as on the farm where I first resided, with a horse-power chaff-cutter; or if straw is not given, good hay is substituted. Again, with regard to sheep feeding. In my opinion the Lincolnshire farmers allow too large an extent for the run of the sheep; the nets, which are always used, being spread right across the Turnip field, and the sheep allowed to remain 10 days or more on the same piece of land; in which system I have seen much waste of Turnips. In Somersetshire and Wiltshire, although perhaps occasionally the other extreme is fallen into, the plan is the best in the end; for the land, by closer folding, gets the benefit of the sheep's manure more regularly and thickly diffused, and the Turnips eaten up as they go on, without waste, by taking a fresh fold every day, or every other day. I should add that the Turnips are cut in Lincolnshire, as well as generally speaking in the best farms of the other two counties above named; but that oilcake is more generally given to sheep in Lincolnshire than in those two counties, as likewise to beasts, for which last, however, the Turnips and straw are, as I said before, often not cut. We next come to the "stacking" of Lincolnshire, for in that county stacks is the term used, whilst here they are called ricks or mows. The former is the more appropriate name for Lincolnshire, as their corn is shaped up more in the form of our hay-stacks, not being raised from the ground on a staddle, as we term it in Somersetshire; the latter I think the best and neatest way, as being more security against vermin. For the descriptions of soils of the districts of the two counties which I visited, I must give reference to my reports for the past two years from West Somerset and East Lincolnshire farms, the former having more variety of soil to offer to a geologist than the latter, which on the Wolds abounds much in chalk. I must now conclude with a few remarks on the farming of this district. 1st, As I am on the subject of soils, I will endeavour to describe this: A line of limestone hills runs through the country, opposite to what are called the Mendip hills, between which is a wide valley or rather flat land, of rich black description, something similar to the Cambridgeshire Fens, but this varies to red sandstone near the limestone hills, and around the peaty land is a clay, which becomes in places of a bluish character, adapted for Wheat and Beans. On the limestone hills nothing can exceed the luxuriant green of the pastures, which are remarkably early for sheep keep in spring. This is chiefly a dairy and grazing district, the best Grass land letting from 3*l.*, and in some cases 4*l.* an acre. There is comparatively little land under the plough, and until lately what there was had not been well managed, few roots being grown, and beasts grazed on hay alone, which, however, was of good quality. Now, however, a great improvement is manifest, chiefly from the example of gentlemen farmers in the neighbourhood, and Turnips and Mangold are now to be seen in perfection, grown on this rich soil with little assistance from manure. When near the rock it is found necessary to manure the Turnips, as has been proved by comparative experiments, those grown without manure being nothing in point of size; in fact, superphosphate of lime will grow Turnips anywhere, and may be almost, we may say, "grown on a deal board." Witness Mr. Huxtable's experiment. Another improvement is the introduction of iron ploughs and a pair of horses working, instead of the line of three or four, with a boy leading. With reference to this subject, where the soil is a heavy clay, like the old red clays of Devon, I think oxen may be kept up in some cases (worked always in collars), which may pay, after being worked two years, to be then grazed; but I should never allow more than two horses in a plough, so that on a farm of mixed soils we might have pair horse ploughs and four for oxen. The great want now of this country is farm buildings of a new and better description, with a view to economise manure; but this we shall have in time, and I have no doubt the new generation will see a better description of farmer, so that Somersetshire will, in these times of improvement, be able to keep pace with other parts of England.—The beasts in this district are the Hereford, Devons, and Shorthorns, the latter used chiefly in the dairy; the sheep of the Devons, Dorsets, and Southdowns occasionally crossed—there are also Irish sheep. *H. E.*

## Notices to Correspondents.

Cabbage: *W D C.* Early Yorks, sown in July and August, will be ripe in May. Pull every fourth Cabbage, and transplant Drumheads sown in February. They will be ready in November, and will keep till January, and if you sow in April again you may have a crop which will be good food in January and February. Of these we can speak from experience. But we print your question for other answers, if correspondents will kindly give them. "I wish to have the longest possible succession of cattle Cabbage, will you kindly tell me how I must manage, and give me the chief periods for sowing?"

Carrots: *Louisa P.* They may be given to sheep with safety and success. Chicory and Flax are both described in Blackie's "Cyclopedia of Agriculture." Flax culture is also well described in a little book by T. K. Short on Flax, for which you should apply to your bookseller. It can be sold in the straw to any large dealer, such as are to be found at Leeds.

Cochin China Fowls: *J L.* Feathers on the legs of fowls, said to be Cochin China, do not indicate impurity of breed, but the contrary.—*M N O.* Specimens with lark-crests would not be allowed to pass as pure at any poultry show. Defective wings and tail are esteemed merits in model Cochin China fowls.

Cow Food: *W M.* Hay being your only food, you may make a less quantity answer by cutting it into chaff—and buying Oat straw, and mixing one of the latter with two of the former—and pouring over the mixed chaff a hot and salt Linseed soup.

Dairy: *P A C.* Several plans and elevations are given in the article, "Farm Buildings," Blackie's "Cyclopedia of Agriculture;" and for ordinary dairy management, see a little book by C. W. Johnson, Esq., entitled the "Modern Cow-keeper."

Drainage Act: *X X.* There is no public Act giving power to charge settled estates in England with the expenses of buildings. There was a clause in the Drainage Act of last session giving such power, when the measure was brought forward; but the Chancellor of the Exchequer spoke against it, and it was struck out. The Acts of the different Drainage and Inclosure Companies give such a power, but we know nothing of its working. *J. G.*

Farm Buildings: *R Greaves.* A number of plans are given in Blackie's "Cyclopedia of Agriculture."—We recommend a plan in which box-feeding is adopted. Potatoes on a burned clay soil will very probably succeed. The quantity of bushels per acre depends altogether upon the size of the sets; when of the common small size for "seed," from 30 to 40 bushels will be needed per acre.

Farm Capital: *E T and J T Plymouth.* We hope to insert a full reply next week.

Grinding Machine: *H W.* We have no personal experience, and must refer you to the makers—as Mr. Z. Parkes, Birmingham; Messrs. Ransome and May, Ipswich, &c.

Liquid Manure Wheelbarrow: *A Hain.* Mr. Coode, 473, Oxford-street, Bloomsbury, is probably the person you allude to.

PIGEONS: *M A* wants to know the names of some pigeon-fanciers in London who breed the Almond Tumbler exclusively.

"RAT! RAT!! RAT!!!" *T L.* Your bookseller must inquire for you; we do not know the publisher.—In cow-houses use powdered gypsum to sprinkle over the floor every morning. Peat charcoal in a future number.

RATS: *S E S* asks where Harrison's pills are to be had.—About Grasses, you should tell us whether your land is light, medium, or stiff; or, perhaps, your better way would be to purchase Lawson's pamphlet on the Grasses, and abide by its directions.

REFUSE FISH: *A Warner.* The best plan would be to cover the heap with vegetable mould and peat, or peat charcoal, or refuse charc al of any sort, so as to detain the effluvia, and let it rot under that cover. This will be better than adding hot lime.

ROOTS, &c.: *W E.* It is not *hurtful* to give unwashed Turnips to cattle, but it is *beneficial* to give them clean ones. Woodpigeons must, we suppose, be warned off, like crows; try a bullet or two among them, you can get near enough for that.

SALT: *A Rutland Subscriber.* We would not hesitate to apply 500 or 600 cwt. per acre, on any free soil, and *try* it (without much hope, however, of success) as a cure for wireworm. But in an inland situation 100 or 200 cwt. of the salt may be applied with reasonable expectation of its improving the crop, besides any such remedial action as that. Apply the salt for a week or two before sowing the seed.

SAWDUST AS LITTER: *G W D* need not fear that the resinous matter in sawdust will injure the feet of his cattle.

ST. QUIVOX: *W J Garnett.* It is in Ayrshire: a wet county.

SMALL PIGS: *H T.* Mr. Fisher Hobbs's black breed; or the Cumberland white breed.

TURNIPS: *Blenbury* wants to know if raw Turnips are good food for breeding sows. We have given Mangold Wurzel uncooked safely, and should imagine Turnips uncooked to be equally harmless.

UDDER OF COW: *B W G.* The teats may be *carefully* divided with a knife, and means taken to prevent the parts reuniting. *W. C. S.*

WARTS: *L M.* The best plan is to dissect the warts out with a knife, and sear the divided vessels lightly with a hot iron. *W. C. S.*

# Markets.

## COVENT GARDEN, JAN. 18.

Hothouse Grapes and Pine-apples are both scarce, and consequently dearer. The supply of good dessert Pears is also limited. Apples are sufficient for the demand. Oranges and Lemons are plentiful, and improving in quality. Nuts remain nearly the same as last week. Forced Vegetables of all kinds are abundant and good. Seakale, Asparagus, and Rhubarb are excellent. French Beans are making their appearance. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Cinerarias, Chrysanthemums, Roses, and the different kinds of spring bulbs.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6s to 8s | Pomegranates, each, 3d to 6d |
| Grapes, hothouse, p lb., 5s to 8s | Almonds, per peck, 6s |
| — Portugal, p. lb., 8d to 1s | — sweet, per lb., 2s to 3s |
| Pears, per doz., 2s to 5s | Chestnuts, per peck, 2s to 5s |
| — per half sieve, 6s to 15s | — per 100, 9d to 1s 6d |
| Apples, dessert, p. bsh. 6s to 10s | Nuts, Barcelona, per bush, 20 to 22s |
| — kitchen do., 5s to 8s | — Brizil, p. bsh., 12s to 14s |
| Oranges, per doz., 9d to 2s | Filberts, p. 100 lbs., 60s to 65s |
| — per 100, 6s to 10s | |
| Lemons, per doz., 1s to 2s | |

### VEGETABLES.

| | |
|---|---|
| Brussels Sprouts, p. hf. sieve, 1s to 1s 6d | Leeks, per doz., 9d to 1s |
| Cabbages, per doz., 6d to 1s | Shallots per lb., 6d to 8d |
| Greens, p. doz. bun., 1s 6d to 2s 6d | Garlic, per lb., 4d to 8d |
| Cauliflowers, p. doz., 1s 6d to 4s | Artichokes, Jerusalem, p. half sieve, 1s to 1s 6d |
| Broccoli, p. doz. bundl., 7s to 12s | Lettuce, Cab., p. score, 6d to 9d |
| French Beans, per 100, 2s to 3s | — Cos, per score, 1s to 1s 6d |
| Seakale, per punnet, 6d to 2s | Endive, per score, 1s to 1s 6d |
| Asparagus, per 100, 2s to 8s | Small Salads, p. punn, 2d to 3d |
| Rhubarb, p. bundl., 6d to 1s 6d | Horse Radish, p. bundl., 1s to 4s |
| Potatoes, per ton, 60s to 100 | Red Beet, per doz., 6d to 1s |
| — per cwt., 3s to 5s | Mushrooms, p. pot., 1s to 1s 3d |
| — per bush., 1s 6d to 2s 6d | Sorrel, per hf. sieve, 6d to 9d |
| Turnips, p. doz. bundl., 1s to 2s | Fennel, per bunch, 2d to 3d |
| Cucumbers, each, 1s 6d to 4s | Savory, per bunch, 2d to 3d |
| Radishes, per doz., 1s to 1s 6d | Thyme, per bunch, 2d to 3d |
| Celery, p. bundle, 6d to 1s 6d | Parsley, per doz. bun., 2s to 3s |
| Carrots, per doz, 2s to 5s | — Roots, p. bundl. 9d to 1s |
| Spinach, per sieve, 1s to 1s 6d | Marjoram, per bunch, 2d to 4d |
| Onions, p. bunch, 3d to 4d | Mint, green, per bunch, 6d to 9d |
| — Spanish, p. doz., 1s 6d to 4s | Watercress, p. 12 bunch., 6d to 9d |

### HAY.—Per Load of 36 Trusses.

SMITHFIELD, Jan. 16.

### HOPS.—FRIDAY, Jan. 17.

Messrs. Pattenden and Smith report that there is a better demand for Hops of all descriptions, at quite as much money. Fine Sussex are very scarce.

### POTATOES.—SOUTHWARK, Jan. 13.

The Committee report that, from the unprecedented mild weather, trade was heavy, which, with a considerable supply, has caused lower prices to be submitted to, particularly Scotch cups, which were nearly unsaleable. The following are this day's quotations:—York Regents, per ton. 80s. to 100s; Scotch do., 55s. to 70s; ditto Cups, 55s. to 60s.; Cambridgeshire and Lincoln Regents, 50s. to 70s.; French whites, 50s. to 60s.

### COAL MARKET.—FRIDAY, Jan 17.

Eden Main, 14s. 3d.; Tanfield Moor, 14s.; Wallsend Hetton, 14s. 3d.; Wallsend Haswell, 15s. 9d.; Wallsend Tees, 15s. 6d.—Ships at market, 124

### SMITHFIELD, MONDAY, Jan. 13.

We have a good supply of Beasts. The trade is very dull, and prices are no better. The number of Sheep is small; however, the mild weather operates against the trade, especially for big Sheep, and it is difficult to obtain higher rates. Some Dutch vessels not having arrived, the supply of Calves is small; trade is, on the average, better in consequence. From Holland and Germany there are 358 Beasts 890 Sheep, and 61 Calves; from Norfolk and Suffolk, 1500 Beasts; from Scotland, 400; and 900 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 6 | to 3 | 8 |
| Best Short-horns | 3 | 2 | — 3 | 4 |
| 2d quality Beasts | 2 | 4 | — 2 | 10 |
| Best Downs and Half-breds | ... 4 | 0 | — 4 | 4 |
| Ditto Sworn ... ... | | | | |

| Ditto Shorn ... ... | | | | |
| Lambs ... ... ... | | | | |
| Calves ... ... | 3 | 2 | — 4 | 6 |
| Pigs ... ... | 2 | 4 | — 3 | 4 |

Beasts, 3949; Sheep and Lambs, 19,070; Calves, 100; Pigs, 295.

### FRIDAY, Jan. 17.

The supply of Beasts is small, so also is the demand. Trade is dull, and it is difficult to maintain Monday's quotations. There is a full average number of Sheep for the time of year; trade is generally rather worse; a few choice things are sold as well as on Monday. Good Calves are scarce and rather dearer. From Germany and Holland there are 44 Beasts, 290 Sheep, and 14 Calves; from Norfolk and Suffolk, 300 Beasts; from Scotland, 40; 100 from the northern and midland; and 86 milch cows from the home counties.

| Best Scots, Herefords, &c. | 3 | 6 | to 3 | 8 |
|---|---|---|---|---|
| Best Short-horns | 3 | 2 | — 3 | 4 |
| 2d quality Beasts | 2 | 4 | — 2 | 10 |
| Best Downs and Half-breds | ... 4 | 0 | — 4 | 4 |
| Ditto Shorn ... ... | | | | |

| Lambs ... ... ... | | | | |
| Calves ... ... | 3 | 3 | — 4 | 6 |
| Pigs ... ... | 2 | 4 | — 3 | 4 |

Beasts, 718; Sheep and Lambs, 3330; Calves, 181; Pigs, 310.

### MARK LANE.

MONDAY, JAN. 13.—The supply of English Wheat to this morning's market by land carriage samples was small; the best descriptions were disposed of at about the prices of this day se'nnight, but the cold and red remained unsold. The business in foreign is almost at a stand-still.—Barley and Peas are a slow sale at late rates.—Beans must be quoted 1s. per qr. cheaper.—The Oat trade is heavy, but we do not reduce our quotations.—French and country Flour can only be disposed of at a reduction of 6d. per sack.

| Foreign ..... | 8111 | 3345 | — | 5296 | 1640 | 724 |

FRIDAY, Jan. 17.—The arrivals of grain this week have been moderate, but the market to-day is almost a nominal one; so little is doing that we are unable to alter our quotations for any article. The Flour trade sympathises with the Wheat market, and is exceedingly heavy. A few Polish Odessa cargoes of Wheat on the coast for orders have been sold at 32s. 6d. to 33s. 6d. c. f. and I., and those remaining are now held at 34s. to 35s. Maize is dull, but a cargo of fine Galatz has been sold at 30s. per qr. afloat. Dulness continues the prominent feature of the corn trade, and throughout the kingdom the tendency of Wheat prices has been towards a decline; the trade in spring corn of all descriptions has also been inactive, and late terms with difficulty obtained.

LIVERPOOL, FRIDAY, JAN. 10.—The grain trade since Tuesday has been without animation, and at this morning's market the transactions were quite in retail. There was no observable change in the quotations of Tuesday, excepting for Indian Corn, which, being in limited request, was considered 6d. per qr. cheaper.—TUESDAY, JAN. 14.—Excepting fair quantities of Oats and Oatmeal from Ireland this week, the other arrivals thence and coastwise are quite trifling. The foreign supplies are also upon a reduced scale, as compared with former weeks. The week's exports to Ireland and coastwise are larger than usual. The grain trade throughout the past week has continued in the same languid state as for some time past, without, however, much variation in the price of any article. The open and damp weather we have experienced may partly account for the depression, by keeping farmers from field labour, and to their serving the interior markets liberally with their produce. At to-day's market the middling descriptions of Wheat were in modera e request from the town and neighbouring millers, and a few Irish buyers, at from 5s. 8d. per 70 lbs. for French red, up to 6s. for Canadian mixed, which are much the same rates as on this day se'nnight. Fine Wheats are held with firmness. The best samples of Oats and Oatmeal supported late prices, but inferior were hard to sell, and ½d. to 1d. per bushel, and 6d. per load lower. Egyptian Beans declined 6d. per qr. Barley and Peas were unaltered in value, and in slow demand.

HARTLEY'S PATENT ROUGH PLATE GLASS, FOR CONSERVATORIES, &c.

See Article in the GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

Supplied Wholesale, Retail, and for Exportation; cut to order in panes of

8 by 6 under 10 by 8.....4½*d.*; 10 by 8 under 14 by 10.....5*d.*
14 by 10 under 1½ foot, not above 20 inches long ...5½*d.*

7 by 5 and 7½ by 5½.....13 6 | 9 by 7 and 9½ by 7½ and 10 by 8 .....16 6

Well worth the attention of Nurserymen and Market Gardeners.

LACTOMETERS for trying the quality of MILK, 4 Tubes, 5*s.*, 6 Tubes, 7*s.* 6*d.*

MILK PANS, from 2*s.* to 6*s.* each; METAL HAND-FRAMES, Glass Tiles and Slates, Propagating and Bee Glasses from 2*d.* each; Grape Glasses; Cucumber Tubes, 1*d.* per inch; Peach Glasses, Wasp Traps, Pastry Slabs, Hyacinth Glasses and Dishes, Fish Globes, Plate and Window Glass, Lamp Shades. GLASS SHADES.—Estimates and List of Prices forwarded on application

TO THEIR WAREHOUSE, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS FOR CONSERVATORIES, GREENHOUSES, PITFRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes.

6 by 4 ins., 6 by 4½ ins., 6½ by 4 ins., 6 by 5½ ins., 6½ by 5 ins., 12*s.* each.

6½ by 5½ ins., 6 by 6 ins., 6½ by 6 ins., and under 8 by 6 ins., 13*s.* each.

9 by 7 ins., 9½ by 7½ ins., and 10 by 8 ins., 15*s.* each.

Large sizes, 16 oz., 2*d.* and 2½*d.* per foot.

Large sheets, in 200 and 300 feet cases, 2¼*d.* to 2¾*d.* per foot.

16*s.* per box; or 2¾*d.* per foot if less than one box be taken:

| | |
|---|---|
| 11 inches by 8 inches | 13 inches by 9 inches |
| 12 " by 8 " | 12 " by 10 " |
| 12 " by 9 " | 14 " by 10 " |

Boxes charged 1*s.* each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to how, sending afterwards the inferior, described as above.

CUT TO ORDER IN PANES.

For Prospectuses and information respecting the Course of Studies for the elder and younger Students, &c, apply to the Principal, the Rev. J. S. HAYGARTH, M.A.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

IRISH PEAT CHARCOAL.
TO FARMERS, AGRICULTURISTS, AND OTHERS.

THE IRISH AMELIORATION SOCIETY beg to draw the attention of the public generally to the fertilising and deodorising properties of Irish Peat Charcoal. Mixed with night-soil or sewage matter it instantly and wholly destroys all offensive smell, renders it easy of manipulation, adapts the fertilising properties as a ready food for plants, and enables it to be transported by Railway or any other conveyance without the slightest inconvenience.

The extent to which Charcoal (carbon) enters into the composition of every article of agricultural produce, and the value of night-soil as a manure, render any observations on these points unnecessary. Mixed with night-soil, in about equal weights, a most efficacious manure is produced at a very small cost.

Price of the Charcoal, ready for use, at Dublin, exclusive of sacks, 35s. per ton; in London, Liverpool, Bristol, and other seaports in England 60s. per ton, sacks included.

Agents will be forthwith appointed in all the principal towns in England.

Head Office, 9, Waterloo-place, London.
Jan. 18, 1851. G. L. PARROTT, Secretary.

MANURE DEPOT.
TO FARMERS, AGRICULTURISTS, &c., &c.

G. H. FOLEY, Essex Wharf, Lea-bridge, Middlesex, Agent, by appointment, to the Irish Amelioration Society, for the sale of IRISH PEAT CHARCOAL, an excellent Fertiliser, and when mixed with night-soil or sewage matter renders both inoffensive, and retains all their fertilising properties, and producing, combined, a very valuable Manure, at a remarkably low cost; capable of being conveyed in sacks or otherwise. Price of the Charcoal, in its pure state, 60s. per ton; mixed with night-soil, 45s. per ton, sacks included.

All needful particulars will be given upon application at the above address.

PAGE AND CO., SEED MERCHANTS, &c., to the Horticultural and Agricultural Society of Western India, 38, Oxford-street, and 58, Above Bar, Southampton, have to offer a few packets, at 1s. 6d. each, of the BEANS spoken so highly of in the *Gardeners' Chronicle* of February 9, 1850, and we subjoin that testimonial. (Copy).—"Dwarf Crimson-seeded Bean, alias Fève très naine rouge, naine rouge. The earliest and most dwarf of all the sorts of Beans; stems scarcely attaining a foot in height, branching close to the ground, and bearing profusely; pods about 3 inches in length, generally well filled; the Beans are crimson, nearly the size of those of the long-pod. It might be grown in rows from 12 to 15 inches apart."

New Golden Pea (the best late variety known), 2s. 6d. per quart.
Pages Goliah Do., 2s. 6d. per quart.
Calceolaria, Cineraria, and Geranium, saved from the finest named sorts, 1s. per packet.
12 packets Hardy Annuals, 1s.
Our detailed priced list of Seeds may be had gratis on application.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

TO BE LET, furnished or unfurnished, a comfortable Yeoman's House, with or without about 25 acres of excellent land, divided in 8 Lots. Also, may be had, a Farm adjoining, of about 200 acres, now held by the Proprietor, only half a mile from coal and lime, on the Chester Railway.—Address A. Z., Office of this Paper.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

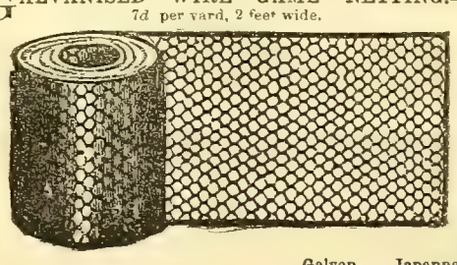
It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.



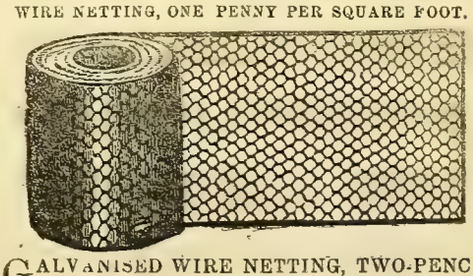
NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

Admission, One Shilling; on Mondays, Sixpence.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| ¾-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1¾-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1¾-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

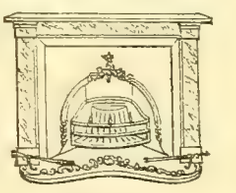
GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | | | |
|---|---|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | | 30 inches wide | 7½*d.* per yard. | |
| 18 ,, ,, | 4½*d.* ,, | | 36 ,, ,, | 9*d.* ,, | |
| 14 ,, ,, | 6*d.* ,, | | 43 ,, ,, | 1*s.* ,, | |

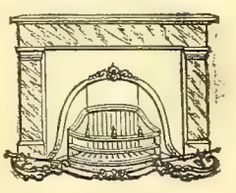
Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

SEED LABELS.



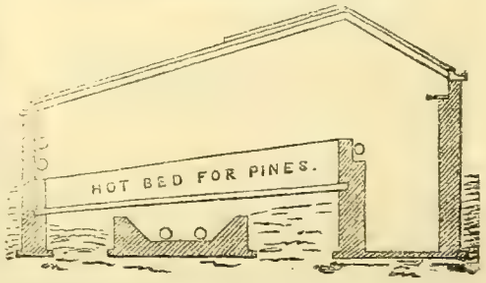
AYRES AND MOORE'S DESCRIPTIVE AND CULTURAL SEED LABELS, are printed on paper of the requisite size for packing the ordinary flower-seeds. Each label, besides containing the scientific and popular name of the plant, and its botanical description, gives simple directions for its culture. The LABELLED SEED PAPERS are used by all the principal Seedsmen of the kingdom, and have received the highest approbation of the horticultural press. As these labels have been now printed on a much better quality of paper than was used last season, the price is 3*s.* 3*d.* per thousand, in quantities of not less than 50 of each sort.—Orders must be sent without delay to DAVID ARD, 170, Fleet-street, London.



STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.



MARBLE CHIMNEY-PIECES, GRATES, AND FENDERS.

J. L. DOWSON, 123, OXFORD-STREET (Five Doors West of Regent Circus), LONDON, has on view, in his extensive Show Rooms, a great variety of Marble Chimney-Pieces, Register Grates, and Fenders, of the most elegant and perfect description. Improved Kitchen Ranges, and other Cooking Apparatus. Every article manufactured upon the most correct principles, and at ready money prices.
SOLE MANUFACTURER OF CUNDY'S PATENT STOVES.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

BEAUTIFYING AND PRESERVING THE HAIR—To preserve the human hair has been for a long time the unsuccessful pursuit of innumerable chemists and naturalists, and although there have been various compounds professing to accomplish this desirable end, still nothing really capable of restoring and preserving one of the most beautiful of Nature's gifts was discovered until 1821, when the result of a series of experiments, tried for a long previous period upon persons of all constitutions, fully established the infallible virtues of

C. AND A. OLDRIDGE'S BALM OF COLUMBIA.

The wonderful efficacy of this inestimable compound in restoring the hair to its pristine beauty, and the certainty with which its conservative agency operates in preserving it, has received, as might be expected, the most flattering testimonials from the grateful thousands who have experienced its effects.—3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle; no other prices.—When you ask for OLDRIDGE'S BALM, never let the shopkeepers persuade you to use any other article as a substitute.—13, Wellington-street North, Strand, a few doors above the Lyceum Theatre, on the opposite side.

HOLLOWAY'S OINTMENT AND PILLS THE BEST REMEDY TO CURE BAD LEGS.—Eliza Dew, the wife of a farm-servant, leaving at Dinton, near Salisbury, suffered for several months with a sore Leg, the ulceration of which was so dreadfully obstinate that it defied the skill of eminent Medical Men to abate its malignancy. When in its worst state, she commenced using HOLLOWAY'S OINTMENT and PILLS, which soon produced favourable appearances; and, by persevering in their use for a short period, she can now boast of a sound cure. There is no case, however obstinate, bad, or long standing, but may be cured by these admirable Medicines.—Sold by all Druggists; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

HARRY HIEOVER'S WORKS.
In Two Volumes, 8vo, with Portrait, price 24s. cloth,

London: LONGMAN, BROWN, GREEN, and LONGMANS.

SIR JOHN HERSCHEL.
New Edition, 8vo, with Plates and Woodcuts, 18s. cloth,
OUTLINES OF ASTRONOMY By Sir JOHN F. W. HERSCHEL, Bart. &c., &c., &c.
"We take our leave of this remarkable work, which we hold to be, beyond a doubt, the most remarkable of the works in which the laws of astronomy and the appearances of the heavens are described to those who are not mathematicians nor observers, and recalled to those who are."—*Athenæum.*
"In the earlier portions more especially much new matter is introduced..... To all intents and purposes, indeed, *Outlines of Astronomy* must be considered a new work,—so careful has been the revision, correction, and remodelling of the original treatise; so numerous the additions to it; and so important the new trains of inquiry opened up."—*Examiner.*
London: LONGMAN, BROWN, GREEN, and LONGMANS; and JOHN TAYLOR.

KEITH ON THE GLOBES, IMPROVED BY TAYLOR, LE MESURIER, AND MIDDLETON.
New Edition, considerably improved throughout, 12mo, with Plates and Diagrams, price 6s. 6d. bound.
KEITH'S TREATISE ON THE USE OF THE GLOBES; or, a Philosophical View of the Earth and Heavens. New Edition, greatly improved by
ALFRED TAYLOR, M.D., F.R.S, Lecturer on Chemistry, &c., in Guy's Hospital;
R. A. LE MESURIER, B.A., Scholar of Corpus Christi College, Oxford; and
J. MIDDLETON, Esq., Professor of Astronomy.
KEY. Adapted to the New Edition, by Professor MIDDLETON. 12mo. 2s., cloth.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

PESCHEL'S WORK ON NATURAL PHILOSOPHY.
Just published, 3 vols. fcp. 8vo, Woodcuts, 21s. cloth,
ELEMENTS of PHYSICS. By C. F. PESCHEL, Principal of the Royal Military College, Dresden.
Translated from the German, with Notes, by E. WEST.
Vol. I. contains "The Physics of Ponderable Bodies," 7s. 6d.
Vols. II. and III. "Imponderable Bodies," 13s. 6d.
"We trace the hand of a master, who has placed before his readers, in the most lucid order, those branches of science in their modern improved state. The work is a little encyclopædia of physical science, and we heartily recommend it as a work by which the public will benefit."—*Philosophical Magazine.*
London: LONGMAN, BROWN, GREEN, and LONGMANS.

New Edition, corrected, with Notes of Cases judicially decided since the New Act came into operation, fcp. 8vo, price 2s. 6d.
PLAIN DIRECTIONS for MAKING WILLS, in conformity with the New Act.
By J. C. HUDSON, late of the Legacy-Duty Office.
"The introduction ought to be read by every person who has any property to leave; and the book appears very plainly written. It is on these grounds highly to be recommended."
*British Magazine.*
By the same Author, 7th Edition, fcp. 8vo, price 5s.
THE EXECUTOR'S GUIDE.
"A useful little work, carefully written, and well arranged."
*Legal Observer.*
*** The two works, bound in one volume, 7s. cloth.
London; LONGMAN, BROWN, GREEN, AND LONGMANS.

NEW EDITION OF MR. MACAULAY'S ESSAYS.
Just published, in square crown 8vo, uniform with Southey's "Doctor" and "Commonplace Book," with Portrait by E. U. Eddis, engraved by W. Greatbach, and Vignette, price One Guinea cloth; or 30s. handsomely bound in calf by Hayday.
CRITICAL AND HISTORICAL ESSAYS contributed to the Edinburgh Review. By THOMAS BABINGTON MACAULAY. A New Edition, complete in One Volume.
*** Also, an Edition (the 6th) in 3 vols. 8vo, price 36s. cloth.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

Eighth Edition, thoroughly revised, corrected, and improved; in One thick Volume, 8vo, price 30s. cloth,
HOOPER'S MEDICAL DICTIONARY. Eighth Edition, revised, corrected, and improved, by KLEIN GRANT, M.D., Lecturer on the Practice of Physic at the Aldersgate School of Medicine, &c.
"Compared with the early editions, it may, from the great increase of matter, be regarded as a new work. Dr. Grant has succeeded in preserving the plan of the late Dr. Hooper, and at the same time in giving to his labours that extension of detail which the recent progress of medicine had rendered necessary. * * * This edition will be found more extensively useful than any of those which have preceded it."—*Med. Gaz.*
London: LONGMAN, BROWN, and Co.; Hamilton and Co.; Simpkin and Co.; Whittaker and Co; S. Highley; T. Bumpus; Houlston and Co.; H. Renshaw; B. Fellowes; H. G. Bohn; J. Churchill; Orr and Co.; Bickers and Bush; G. Routledge; Tegg and Co.; Griffin and Co.; and E. and F. Waller. Edinburgh: A. and C. Black; and Maclachlan and Co. Dublin: Fannin and Co.

The Tenth Edition, in One Volume, fcap. 8vo, price 7s. 6d.,
ELIZA ACTON'S MODERN COOKERY reduced to a System of Easy Practice: with Directions for Carving.
*** Both the quantity of every article necessary for the preparation of each recipe, and the time required for its preparation, are minutely stated.
"The whole of Miss Acton's recipes, 'with a few trifling exceptions, which are scrupulously specified, are confined to such as may be perfectly depended on from having been proved beneath our own roof, and under our own personal inspection.' We add, moreover, that the recipes are all reasonable, and never in any instance extravagant. They do not bid us sacrifice 10 lbs. of excellent meat, that we may get a couple of quarts of gravy from it; nor do they deal with butter and eggs as if they cost nothing. Miss Acton's book is a good book in every way; there is right-mindedness in every page of it, as well as thorough knowledge and experience of the subjects she handles."—*Medical Gazette.*
London: LONGMAN, BROWN, GREEN, and LONGMANS.

NEW EDITIONS OF NESBIT'S MENSURATION, LAND-SURVEYING, &c.
A New and Improved Edition, augmented by a Treatise on Levelling, in 12mo, price 6s. bound,
A TREATISE on PRACTICAL MENSURATION By A. NESBIT. With nearly 700 Practical Examples and 300 Woodcuts.—KEY, 5s.
By the same Author, New Edition, 8vo, with Plates, Woodcuts, and Field-Book, price 12s.
TREATISE on PRACTICAL LAND-SURVEYING. Corrected and improved, with the addition of Plane Trigonometry, including the use of the Theodolite, and Railway Surveying, Railway Engineering, Levelling, Planning, Laying out Curves, &c., by T. BAKER.
TREATISE on PRACTICAL ARITHMETIC. Part I., 5s.—KEY, 5s. Part II., 7s. 6d.—KEY, 7s.
INTRODUCTION to ENGLISH PARSING. 18mo, 2s. 6d.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

Eleventh Edition, carefully revised, with new discoveries introduced by the Author, in fcp. 8vo, with numerous Plates price 10s. 6d., cloth,
CONVERSATIONS ON NATURAL PHILOSOPHY: in which the Elements of that Science are familiarly explained, and adapted to the comprehension of Young Persons. By JANE MARCET.
"These Conversations are intended, in the course of elementary science, to precede the Conversations on Chemistry. Each succeeding edition has been carefully revised, and new discoveries introduced, by the author."—*Extract from Preface.*
By the same Author, New Editions of
CONVERSATIONS on CHEMISTRY, 2 vols. 14s.; on LAND and WATER, Map, 5s. 6d.; on POLITICAL ECONOMY, 7s. 6d.; on VEGETABLE PHYSIOLOGY, Plates, 9s.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

Now ready, in One Volume, handsomely bound, price 10s. 6d., dedicated, by permission, to the Right Hon. Lord Holland,
THE BEAUTIES OF MIDDLESEX: being a particular description of the principal Seats of the Nobility and Gentry, in the County of Middlesex, comprising all that is interesting in the History, Architecture, and Internal Adornments of the Mansions, Villas, &c., and in the Gardens, Parks, and Pleasure Ground Scenery, from visits made in 1849 and 1850.
By WILLIAM KEANE, Author of "The Beauties of Surrey."
"It is an interesting work of reference, and is interspersed with many highly useful and instructive remarks of a critical bearing."—*Gardeners' Magazine of Botany.*
"The work is very creditably got up, and the descriptions are correctly given. As a book of reference this is really a very nice work."—*The Gardeners and Farmers' Journal.*
"If we were desirous of impressing upon a stranger the extent and prevalence of the taste for gardening now existing in England, we could not effect our object better than by placing in his hands a volume just issued from the press, entitled 'The Beauties of Middlesex.' Its author, Mr. W. Keane, has visited those residences, and records their peculiarities in the pages before us."—*Cottage Gardener.*
As the work is Printed for the Author, all orders addressed to Mr. W. KEANE, Regent-terrace, King's-road, Chelsea, and made payable at the Chelsea Post-office, will receive immediate attention.

A MANUAL of the MERCURIAL and ANEROID BAROMETER. By JOHN HENRY BELVILLE, of the Royal Observatory. Price 1s. Second Edition.
Also, by the same Author,
A MANUAL OF THE THERMOMETER, and on the Climate of England. Price 1s.
London: R. and J. E. TAYLOR, Red Lion Court, Fleet-street.

Printed by WILLIAM BRADBURY, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JANUARY 18, 1851.

AMERICAN PLANTS

JOHN WATERER'S CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, &c., may be obtained gratis on application. It describes the colour of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections. He has many thousands of Rhododendron ponticum in sizes very suitable for planting immediately into Game Preserves, very healthy bushy stuff, price 5*l.*, 7*l.* 10*s.*, and 10*l.* per 1000.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway, and three miles from Blackwater, South-Eastern Railway.

TO GENTLEMEN, GARDENERS, AND OTHERS.

ORANGE AND LEMON TREES.—Any private grower having four Orange and two Lemon Trees to dispose of, 8 or 10 feet in height, with clean stems, good heads, and in a healthy condition (by stating price), may hear of a purchaser by applying to Mr. ROBERTS, Gardener, Raby Castle.

Raby Castle, Darlington, Jan. 25.

DOUBLE ITALIAN TUBEROSE ROOTS.—The Bulbs of this most beautiful and fragrant Flower have been just received from Italy, at A. COBBETT'S Old-established Italian Warehouse, 18, Pall-mall; they are warranted double, and large and choice roots of which are selected at 4*s.* per dozen. N.B.—Orders by post punctually attended to.

NEW KITCHEN GARDEN SEEDS.—Warranted Excellent quality. Carriage Free! (See below).

| | | £ | *s.* | *d.* |
|---|---|---|---|---|
| No. 1. | Complete collection of 20 quarts of the newest and most prolific Peas, with all other Seeds in proportion, for one year's supply ... | 2 | 10 | 0 |

| No. 3. | ditto ditto ditto ... | 1 | 0 | 0 |
| No. 4. | ditto ditto ditto ... | 0 | 12 | 6 |

*A List of the kinds furnished in the above collections will be found in our* PRICE CURRENT AND GARDEN DIRECTORY, *which can still be had on application.—See* Gardeners' Chronicle, *Jan.* 4, 1851, *back page.*

*** All Seed Orders above 2*l.* delivered Free of Carriage to any Station on the Great Western, Bristol and Exeter, or South Devon Railways; or to Cork, Dublin, or Belfast, by steamers.

Apply to WILLIAM E. RENDLE & Co.,
Seed Merchants Plymouth.

N.B.—All the New Vegetable and Flower Seeds advertised from time to time in this Paper can be obtained from us, at the regular current prices.

SPLENDID NEW HARDY DIANTHUS.—"DIANTHUS REIDII."

J. REID begs to state that he has succeeded in saving a small quantity of the seed of his new Dianthus. The flower of this magnificent plant is from 3 to 4 inches in diameter, the colour is bright scarlet, laced with white. From the middle of May till the end of August this gem of the flower-garden is perhaps without a rival. J. R. is also sending out a small quantity of choice Polyanthus seed, which he can with confidence recommend.

Dianthus seed, 1*s.* per packet. Polyanthus seed, 6*d.* per packet. On the receipt of penny postage stamps to the amount, one or both will be sent free to any part.

J. REID, Seedsman, &c.
Richmond-street, Weston-Super-Mare, Somerset.

HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENTS, MAIDSTONE, AND ADJOINING THE SOUTH-EASTERN RAILWAY STATION, ASHFORD.

WM. JAS. EPPS begs to state that he has taken the Nursery and Seed-growing business late in the occupation of Mr. James Cutbush, Sen., adjoining the Railway Station, Ashford, where he is making extensive alterations for carrying on the above business, in conjunction with his Nursery and Seed Establishment, Maidstone. The proximity of the Ashford business to the Romney Marsh (which is the largest and by far the best seed-growing district in the kingdom), will enable him to offer many advantages; great attention will be paid in selecting and growing the stocks true to their kind. He is now prepared to receive commissions from any respectable wholesale house. The prices, per contract, this year are exceedingly low, and any further information upon this subject may be had upon application, also his wholesale and retail List of Seeds.

W. J. E. has a large and splendid stock of the following Seeds, which he can warrant to any extent, and at very low prices—terms, three months, upon satisfactory reference—Skirving's Purple-top Swede, Laing's Purple-top Swede, Mangold Wurzel, White Carrot, Parsnip, Champion of England Peas, Imperial, Victoria Marrow, Blue Prussian, Broccoli, and Cabbages of sorts; Kohl Rabi and Mustard. All seeds carriage paid to London.—Jan. 25.

SUTTON'S LETTUCES AND CUCUMBERS.

JOHN SUTTON AND SONS, SEED GROWERS, Reading, Berks, have much pleasure in referring their friends to the description of their superior sorts of Lettuces, given by the Editor of the *Gardeners' Chronicle*, in March last, which will be seen in Messrs. SUTTON'S advertisement on the last page of the present Number of this Paper; as also the following extract from a letter just received:

From Mr. Smithers, Head Gardener to the Earl of Carnarvon, High Clere, near Newbury.

"Messrs. SUTTON and SONS.—Gentlemen,—I have grown all the sorts of Cucumbers which I have seen advertised, but the 'Conqueror of the West' is far before any other in my estimation. I have now grown it several years, and intend to grow none other this season. Your Lettuce, too, is excellent, and certainly I have never seen any sort so large. I have observed that it is not so apt to run to seed as others, which renders it very valuable in hot dry summers and for autumn use."

N.B.—These Seeds will be sent free by post on receipt of postage stamps in payment, according to the prices named in the advertisement above referred to.

HEATHS AND OTHER PLANTS FOR EXHIBITION.

WILLIAM JAMES EPPS begs to state that he has for sale the finest Stock of Young HEATHS and other Greenhouse and Stove Plants possible, which will make splendid specimens in a short time. The superior character of Plants sent out from this Establishment is justly admitted by all who have purchased. The magnificent specimens of Heaths, &c., exhibited by him last season at the Exhibitions at Chiswick and the Royal Botanic Gardens, London, where he received the highest awards, fully justify the foregoing remarks.

Strong bushy Plants can be had at the following low prices, exclusive of packing, carriage paid to London:

| | £ | *s.* | *d.* |
|---|---|---|---|
| 100 fine varieties of Heaths ... ... | 5 | 0 | 0 |
| 50 ditto ditto | 2 | 12 | 6 |
| 25 ditto ditto | 1 | 10 | 0 |
| 100, including all the finest varieties of ditto ... ... ... | 7 | 10 | 0 |
| 50 ditto ditto | 4 | 0 | 0 |
| 25 ditto ditto | 2 | 2 | 0 |
| 100 fine vars. of Stove and Greenhouse Plants ... ... | 5 | 0 | 0 |
| 50 ditto ditto | 2 | 12 | 6 |
| 25 ditto ditto | 1 | 10 | 0 |
| 100 newest and finest vars. of ditto ... | 7 | 10 | 0 |
| 50 ditto ditto | 4 | 0 | 0 |
| 25 ditto ditto | 2 | 2 | 0 |

All the new leading kinds of Geraniums and Cinerarias 12*s.* to 21*s.* per doz.

Catalogues of the above may be had on application.
Bower Nurseries, Maidstone.—Jan. 25th, 1851.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Jan. 25.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

J. G. WAITE'S CATALOGUE OF VEGETABLE SEEDS is now Ready, with Prices to suit the times, and can be had on application.
181, High Holborn, London.

J. G. WAITE'S CATALOGUE OF FLOWER SEEDS is also Ready, and can be had on application.
181, High Holborn, London.

SION-HOUSE DWARF FRENCH BEAN, new, early, buff speckled. This is the earliest Bean known, and can be had in any quantity, price 21*s.* per bushel.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London, where every other kind of Seed in cultivation can be had, on better terms than at any other House in the Trade.

RHUBARB ROOTS TRUE TO NAME.—Myatt's Victoria, 6*s.* per doz; Myatt's Linnæus, 9*s.* per doz.; Mitchell's Albert, 9*s.* per doz.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

STRAWBERRY PLANTS.—Kitley's Goliah, 10*s.* per 100; Myatt's Eleanor, 4*s.* per 100.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

NEW GIANT ASPARAGUS PLANTS, 5*s.* per 100. LARGE GIANT SEAKALE PLANTS, 8*s.* per 100.
At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

AN UNLIMITED STOCK OF REMARKABLY FINE SEEDLING AND TRANSPLANTED LARCHES AT REDUCED PRICES.

WM. WOOD AND SON, being very extensive holders of the above, and all other kinds of seedling and transplanted Forest trees, will be happy to furnish prices on application.

N.B. Catalogues of Vegetable, Flower, and Agricultural Seeds, also of Nursery Stock, will be forwarded free.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

ROSES.

ADAM PAUL AND SON beg to inform their friends and the public in general that they have still a good stock of most of the leading kinds of ROSES, which, when the selection is left to them, they offer on the following advantageous terms:

| | | |
|---|---|---|
| Standard Roses, in 12 superior vars., | 18*s.* to 24*s.* | per doz. |
| Dwarf Standard do. | do. 12*s.* to 18*s.* | ,, |
| Climbing Roses | do. 9*s.* to 12*s.* | ,, |

A priced descriptive Catalogue forwarded on receipt of one postage stamp.

All packages delivered free of carriage to London.
Nurseries, Cheshunt, Herts, Jan. 25.

NURSERY CATALOGUES.—The following priced Catalogues may be obtained from the Cheshunt Nurseries, free by post, on receipt of one postage stamp.

A. Descriptive Catalogue of Roses.
B. Catalogue of Hardy Ornamental Trees and Shrubs.
C. ,, Fruit Trees.
D. ,, Hardy Herbaceous Plants.
E. ,, Forest Trees.
F. ,, Greenhouse Plants, &c.
G. ,, Agricultural, Garden, and Flower Seeds.

N.B.—The prices are attached to every article. All packages delivered free of carriage to London.
ADAM PAUL and SON, Nurseries, Cheshunt, Herts.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE OF SEEDS is now ready, being a part of their ANNUAL SEED AND PLANT LIST, which will shortly be complete, and forwarded as a newspaper, free by post. The Parts now ready may be had together for a penny stamp, viz.:

PART I. FLOWER SEEDS, containing a scale of priced selections of 422 of the new and most approved sorts, with colour, height, hardiness, duration, price of each packet, and other useful information.

PART II. VEGETABLE SEEDS, with priced scale of collections, time of sowing each description of Vegetable, and price of each variety, with heights of Peas, and other descriptive information.

PART III. AGRICULTURAL SEEDS, containing also much useful and descriptive information.

PART IV. ROOTS, FRUITS, AND BULBS for early planting.

PART V., as far as complete, contains a scale of prices of our choice selections of plants, and the principal part of our descriptive list of Geraniums.

Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW DWARF CRIMSON SEEDED BEAN,
*Alias* FEVE TRES NAINE ROUGE, NAINE ROUGE.

PAGE AND CO., SEED MERCHANTS, &c., to the Horticultural and Agricultural Society of Western India, 38, Oxford-street, and 58, Above Bar, Southampton, have to offer a few packets of the above excellent Bean, at 1*s.* 6*d.* each, so highly recommended in the *Gardeners' Chronicle* of Feb. 9, 1850. The earliest and most dwarf of all the sorts of Beans, stems scarcely attaining a foot in height, bearing profusely, pods about 3 inches in length, generally well filled. The seed, when dry, is crimson, nearly the size of the Long-pod. It might be grown in rows, from 12 to 15 inches apart.

New Golden Pea (the best late variety known), 2*s.* 6*d.* per quart; PAGE'S Goliah, ditto, 2*s.* 6*d.* per quart.

Calceolaria, Cineraria, and Geranium, saved from the finest named sorts, 1*s.* per packet; 12 packets of Hardy Annuals, 1*s.*

Our detailed Priced List of Seeds may be had gratis, upon application.

N.B. Gardeners' and Land Stewards' Registry Office. No charge except Postage.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

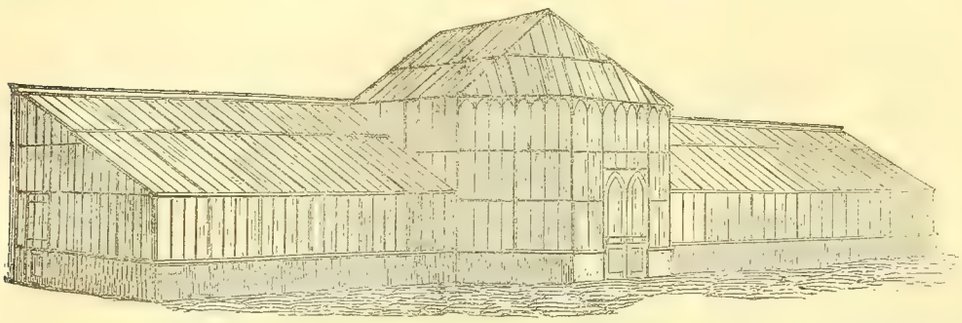
| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem ... ... ... ... ... | 42*s.* to 60*s.* |
| Extra superior selected Standards ... ... ... | 18*s.* to 24*s.* |
| Fine Dwarfs and Dwarf Standards ... ... ... | 10*s.* to 16*s.* |
| Superb do. do. (for exhibition) ... | 18*s.* |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 ... | 50*s.* |
| Good do. do. without names, per 100 | 30*s.* |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

SEEDS OF THE BEST QUALITY, CARRIAGE FREE.

J. C. WHEELER AND SON have had the honour of being appointed Seedsmen to the Gloucestershire Agricultural Association. Their Priced List of Seeds for this season is just ready, and will be forwarded free by post to any address on receipt of two postage stamps. This Catalogue is not a long list of useless names; it is really what it professes to be, a List of the best Seeds in cultivation, and will be found a safe guide to all purchasers.

Dr. LINDLEY, in the *Gardeners' Chronicle*, of the 2d March last, strongly recommends it in the following terms:



"THE CATALOGUE OF SEEDS SOLD BY J. C. WHEELER AND CO., GLOUCESTER, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless, incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."

J. C. WHEELER and SON deliver their Seeds CARRIAGE FREE.
Kingsholm Nursery; and 99, Northgate-street, Gloucester.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

# PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.

## E. DENCH, PATENTEE.

Vinery, 24 feet 6 inches. Conservatory, 20 feet. Peach-house, 24 feet 6 inches.

THIS RANGE WAS ERECTED FOR A GENTLEMAN AT NEWARK, NOTTINGHAM.
A similar Range was Erected, and Heated with Hot-water, for C. VICKERS, Esq., Crawley, Sussex.
Mr. GOLDSMITH, the Head-gardener, will give every information.

THE PATENT consists of two distinct principles for all Horticultural Erections—on one plan the Roof is formed wholly of Iron and Glass, no wood or putty, &c., and not more than three-quarters of an inch of light being taken up anywhere, and is very light, strong, and elegant, free from drip, and perfectly impossible for the rain to penetrate; the other principle consists of the Roof being formed in Sashes, and the surface of the Roof being Iron, Glass, and Putty, and, the work being hollow, is perfectly free from contraction or expansion. These Houses have been proved in all parts, and are found to excel all others. Heating by Hot-water on most scientific principles.

ONE GOOD SECOND-HAND HOUSE FOR SALE.

FLANAGAN AND SON beg to inform their customers and the public generally, that their Catalogue of VEGETABLE and FLOWER SEEDS is now ready, and a copy may be obtained on application by post or otherwise. FLANAGAN and Son take this occasion of assuring their friends that their Seeds are of the best quality, and trust to receive those orders with which they have for so very many years been favoured.
9, Mansion-house-street, London.

BRITISH QUEEN POTATO.—A new and superior variety—as early as the Shaw, and quality of the Regent, coming in a month before that kind. The grower says, "I planted them last year, close by a good stock of Shaws. They were quite as early, and when each were full grown, the BRITISH QUEEN were worth considerable more money, being much like a Regent, and ready nearly a month before it. My salesman considers them preferable to any Potato he ever saw; they grow short haulm, and in a cluster; will admit of being planted closer together than most sorts."
To be had only of NUTTING and SONS, Seedsmen, 46, Cheapside, London, at 9*s.* per bushel; where may be had every approved kind of Agricultural, Horticultural, and Floricultural Seeds.

THORN QUICK, 70 per cent. below the usual price.—On sale a large quantity of 4-year-old Quick, at 5*s.* per 1000. Parties wanting a first-rate quality for the markets will find the above well worth their attention; the bark and root being all that can be desired. Height, about 3 feet, the greater part being strong enough to fill up old fences. Samples of 150 sent to any part of the country, which, on inspection, will be found worth 10*s.* per 1000.

STAMFORD HILL HORTICULTURAL SOCIETY.—The Exhibitions of this Society for the year 1851, will be held on the undermentioned days, viz.:
THURSDAY, May 15th.
TUESDAY, June 17th.
WEDNESDAY, July 23d.
And the Evening Fête on WEDNESDAY, June 18th.
This Society is confined to the resident gentry and amateurs, but for the general encouragement of Horticulture, prizes are awarded to Nurserymen, who are invited to compete among themselves at each Exhibition.
CHARLES ANDERSON, Honorary Secretary.

POLYANTHUS SEED.
JAMES WOODS has a quantity of Polyanthus Seed, which he can recommend with confidence, saved from none but named and good laced Flowers, price 1*s.* per packet; or sent free on receipt of 13 stamps. Also, a few hundreds of Ranunculus roots of the best old named varieties, in one mixture, at 5*s.* per 100.—Address to JAMES WOODS, Florist, Harwich, Essex.

ROSES FOR THE MILLION.—The following fine Assortment, comprising most of the best ever blooming ROSES in existence, are offered in strong one-year-old plants from pint pots, on their own roots, at the following advantageous terms, package included, on receipt of a Post-office order from unknown correspondents for the amount.
HYBRID PERPETUAL.—Amandine, Géant des Batailles, Comte de Egmont, Aubernon, Baronne Prevost, Comte de Montalivet, Comte d'Eu, Comte de Paris, Dr. Arnal, General Moranquiez, General Jacquimint, La Reine, Lady Alice Peel, Pius IX., Madame Laffay, Madame Trudeaux, Rivers' Robin Hood, Sidonie, William Jesse, Henry IV., Clementine Seringe, and Duke de Alencon.
BOURBON.—Queen, Bouquet de Flore, Desgaches, Enfant d'Ajacio, Beauty of Versailles, Madame Angelina, Glory of Paris, Henry Lecoq, La Grenadier, Menoux Marianne, Pierre St. Cyr, Reine des Vierges, Gloire de Rosamène, Souvenir de la Malmaison, and Plantier.
CHINA.—Clara Sylvain, Mrs. Bosanquet, Tancredi, Cramoisie Superieure, and Fabvier.
TEA-SCENTED.—Adam, Bougere, Comte Paris, Devoniensis, Caroline, Mansais, Reine de Bassora, Viscountess de Leages, and Noisette Eclair de Jupiter.

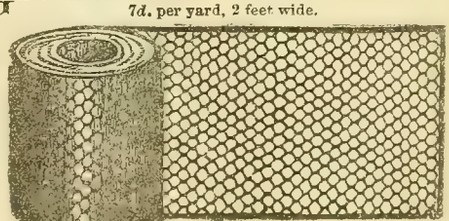
N.B. Descriptive Catalogues on application.
ARCHIBALD GODWIN, Rose Grower, Ashbourne, Derbyshire.

BAROMETERS FOR THE MILLION.
BROWN'S REGISTERED BAROMETER is sold by HENRY BAKER, INSTRUMENT MAKER TO THE BOARD OF ADMIRALTY, 90, Hatton-garden, London, price 10*s.* 6*d.* This unique little instrument has given great satisfaction, the price placing it within the reach of persons who would not be able to purchase a more expensive article. Persons purchasing a dozen supplied at the wholesale price, for cash only. Night Thermometers for registering the extreme of cold, 5*s.*

SILVER SAND, PEAT, &c.—REDUCTION OF PRICE.
EDWARD KEMP begs to return his grateful acknowledgments to his Friends and Patrons for favours hitherto received, and informs them that he has made considerable reduction in the price of Silver Sand, which he trusts will ensure a continuance of their support. Particulars will be forwarded on application addressed EDWARD KEMP, 16, Ann's-place, East-street, Old Kent-road, London.
N.B. No connection with any other party.

DR. S. NEWINGTON'S PATENT DIBBLES, HAND-HOE CULTIVATORS, DRILLS, and other Agricultural Implements for effecting a more scientific system of cultivation, and insuring more abundant crops. Early orders must be given to ensure early execution. An illustrated Catalogue, &c., may be obtained on application to Messrs. DUFAUR and Co., sole manufacturers, 21, Red-lion-square, London.

CUCUMBER and MELON BOXES and LIGHTS.
One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England.—JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.



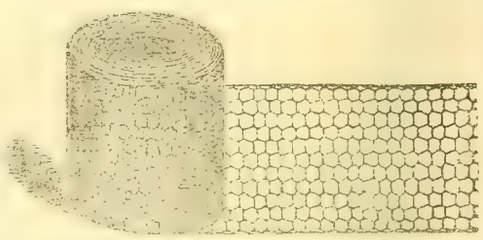
PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

TO GENTLEMEN, THE NURSERY TRADE, AND OTHERS.
TO BE SOLD CHEAP, about 40 Fine Large Standard-trained Nectarine, Apricot, and Plum Trees.—The trees have been on the wall six years—6 feet stems, fine heads, and of the best kinds. The reason why the above are to be disposed of is, that the wall on which the trees are is the property of a public company, and is to be taken down. Such trees are seldom to be had in the Nurseries, and are well worth the attention of any one requiring trained trees in a bearing state.—Direct to T. F., 18, Grove-road, Mile-end, London.

TO BE LET, in consequence of the Death of the late Proprietor, a compact NURSERY, in the immediate vicinity of Bristol. Connected with the Nursery is a Dwelling-house, with Stable and other Outbuildings. The person taking to the Nursery may have the option to rent a Shop centrally and eligibly situate in Bristol, calculated for the carrying on of a good Seed Business. The Nursery, Stock, Outhouses, &c., to be taken at a valuation.—For particulars apply to Mr. THOMAS DIX, Solicitor, Small-street, Bristol.

TO BUILDERS AND OTHERS.
TO BE SOLD.—A large quantity of VASES, FIGURES, and ELIZABETHAN CHIMNEY TOPS, will be sold by Auction, on the 27th of January, without reserve, for the purpose of clearing the ground for building, on the premises lately occupied as an Artificial Stone Manufactory, Diana-place, near Fitzroy-square.—May be viewed two days previous to the sale, and Catalogues had of Mr. J. FULLER, Albany-street, Regent's-park, London.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " | ... | 9 " | 6½ " |
| 2-inch " extra strong " | ... | 12 " | 9 " |
| ¾-inch " light " | ... | 8 " | 6 " |
| 1½-inch " strong " | ... | 10 " | 8 " |
| 1½-inch " extra strong " | ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

CHEAP DAHLIAS, FUCHSIAS, AND VERBENAS, for 1851.
J. COURCHA can supply all the new DAHLIAS of last year, at 7*s.* per dozen; older varieties at 3*s.* per dozen; Fuchsias and Verbenas, at 3*s.* per dozen.—Catalogues may be had on application to JOSEPH COURCHA, Florist, 8½, Wellington-row, Hart's-lane, Bethnal-green-road, London.

SEED LABELS.
AYRES AND MOORE'S DESCRIPTIVE AND CULTURAL SEED LABELS, are printed on paper of the requisite size for packing the ordinary flower-seeds. Each label, besides containing the scientific and popular name of the plant, and its botanical description, gives simple directions for its culture. The LABELLED SEED PAPERS are used by all the principal Seedsmen of the kingdom, and have received the highest approbation of the horticultural press. As these labels have been now printed on a much better quality of paper than was used last season, the price is 3*s.* 3*d.* per thousand, in quantities of not less than 50 of each sort.—Orders must be sent without delay to DAVID AYRES, 170, Fleet-street, London.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.
The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.
PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | | |
|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | .. | £3 15 | 0 |
| Do. of 100 yards, 24 ins. wide | .. | 5 0 | 0 |
| Do. of 100 yards, 30 ins. wide | .. | 6 5 | 0 |
| Do. of 100 yards, 36 ins. wide | .. | 7 10 | 0 |

If more or less than a web is required, it would be charged at the same rate per yard.
This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.
C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.
C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.
Workmen sent to all parts of Scotland, England, and Ireland.

REGISTERED ROLLER MILL for Crushing Linseed, Oats, Malt, Barley, &c., and Breaking Beans and Peas. Manufactured by E. R. TURNER AND CO., late HURWOOD and TURNER, St. Peter's Foundry, Ipswich.
E. R. TURNER and Co. claim for their registered Roller Mill the particular attention of Agriculturists, Housekeepers, and others. Besides accomplishing all the purposes of the well-known Roller Mill for crushing Corn and Seeds, by an entirely novel arrangement it is made to break Beans and Peas most effectually, and without involving any delay in adapting the Mill from one process to the other. They are very simple in construction, and therefore not liable to get out of repair; may be worked with ease by one man, and for efficiency and cheapness are superior to any Implement of the kind yet manufactured. Price complete, 9*l.* 9*s.*
E. R. T. and Co. also manufacture a Roller Mill for Crushing only, of the same size as the Registered Roller Mill, and a larger Mill, for which HARWOOD and TURNER were awarded the Royal Agricultural Society's Prize at Norwich in 1849.

Delivered Free to London, Norwich, Bury St. Edmunds, and all intervening Stations. To Hull by water, and all places within 30 miles of Ipswich.
A Discount of Five per cent. allowed for Cash payments.

METCALFE AND Co's NEW PATENT TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.
METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.
CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

SAMUEL FINNEY AND CO.'S CATALOGUE OF SEEDS, for 1851, is now ready, and may be had postage free, on application. It contains a Select List of all the most approved sorts of Culinary Vegetables in cultivation. Also an extensive collection of Flower Seeds, including the imported German kinds, with descriptions, stating the proper time for sowing, hardiness, duration, height, time of flowering, and the colour of each, with much other useful information. The collections of Seeds sent out last year by S. F. and Co. having given general satisfaction, they again offer them as under.

VEGETABLE SEEDS.—CARRIAGE FREE.

We prove the growth of each kind before we send them out.

CUCUMBER—"PHENOMENA."

EDWARD TILEY begs to offer to Cucumber-growers generally the above superb CUCUMBER, which he feels confident will give the greatest satisfaction to them, as did the former kinds sent out by him during the last seven years, being Victory of Bath, Gordon's White Spine, and Lord Keynon's Favourite.

The above splendid Cucumber, "Phenomena," was a hybrid between Hamilton's Black Spine and Mills's Jewess, which it surpasses, both for its prolific qualities and length of fruit, generally growing from 22 to 28 inches. It is a beautiful black spine, of a dark green colour, and free from ribs or shrivels; it also grows quickly, carries its bloom well, and will be found first-rate for exhibition. As a proof of its prolific qualities and length, the following may be vouched for, viz.:—There were cut from two plants, grown in a one-light box, the size of which was 4 feet by 6, 24 brace of Cucumbers, each fruit averaging 22 inches long—total length of the whole amounting to 29 yards 1 foot. It is solid, and eats very crisp. Sold in packets containing seven seeds, 5s.; or three seeds, 2s. 6d.

E. T. has also seed of his three other superb Cucumbers at the following prices:

| | |
|---|---|
| Victory of Bath, per packet ... ... ... | 2s 0d. |
| Gordon's White Spine, ditto ... ... ... | 1 6 |
| Lord Keynon's Favourite, ditto ... ... | 2 6 |

This last is the best for winter cultivation.

MELONS.

BROMHAM HALL GREEN-FLESH MELON.—This has again this season surpassed all others for its superior flavour; it was placed first and second for flavour at the Chiswick Exhibition last season, and obtained a great number of first prizes throughout the country where exhibited. Sold in packets at 1s. 6d. each.

E. T. has also seeds of the following superb Melons, which he can with confidence recommend:

| | | |
|---|---|---|
| Camerton Court Green-flesh ... ... | 1s. 0d. | per packet |
| Queen Melon ... ... ... ... ... | 1 0 | " |
| Blackall's Green-flesh ... ... ... | 1 0 | " |
| Bailey's Green-flesh... ... ... ... | 1 0 | " |
| Bowood Green-flesh... ... ... ... | 1 0 | " |
| Beechwood Green-flesh ... ... ... | 1 0 | " |
| Windsor Prize ditto... ... ... ... | 1 0 | " |
| Emperor ... ... ... ... ... | 1 0 | " |
| Fleming's Trentham Hybrid ... ... | 1 0 | " |
| Duncan's Green-flesh do. Improved ... | 1 0 | " |
| Hampton Court Green-flesh ... ... | 1 0 | " |
| Egyptian do. do. Improved ... ... | 1 0 | " |

Any quantity of the above will be sent postage free to any part on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. WILLIAM BRAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. WILLIAM BRAILSFORD, who, upon their receipt, will return an order upon Mr. RIVERS for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that, although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

FOR CHEAPNESS, QUALITY, DISPLAY, and UTILITY, *the following are strongly recommended.*

HOLLYHOCKS, No. 1, fine double named kinds, all shades of colour, per doz., 9s., or per 100, 2l. 10s. HOLLYHOCKS, No. 2, for border display, very good, per doz., 6s., or per 100, 1l. 10s. These are selected from some hundreds of seedlings, and may be confidently relied on.

HERBACEOUS PLANTS.—Purchaser's Selection, from List, per 100, 3l. 3s.

W. MAY's selection, extra fine, No. 1, 2l. 2s. per 100;
" " really good, No. 2, 1l 10s. "

Having an immense stock they can be furnished at these low prices. The collection extends over 700 species and varieties selected from the choicest stocks in the country (regardless of expense) for display, and warranted second to none. To meet our customers in every way, we hope to be favoured with lists of such plants as are already in their collections, that duplicates of any article may not be sent where the selections are left to ourselves.

FLOWERING SHRUBS AND ORNAMENTAL TREES.—The finest vars., purchaser's selection, from the list, per 100, 3l. 3s.

W. MAY's selection, No. 1, extra fine, per 100, 2l. 2s.
" " No. 2, good kinds, " 1l. 5s.

This Nursery has long held high celebrity for possessing a most splendid stock of flowering shrubs, extending over upwards of 600 species and varieties of the choicest kinds. Some hundreds were selected by Mr. E. KEMP for the Park at Birkenhead; and for correctness of naming, quality, and health, not excelled by any.

To gentlemen forming Arboretums, or making extensive Ornamental Shrubberies, this is an opportunity seldom offered.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4l.; or per 100, 10s., fine healthy stuff; 2 to 3 feet, bushy, extra fine, per 1000, 5l.—per 100, 15s.

GOOSEBERRIES, all the finest Lancashire show sorts, per 1000, 4l., in 100 varieties, or per 100, 10s., in 50 varieties; the stock extends over 30,000, and is very fine and healthy.

CURRANTS—White, Red, and Black, including Black Naples, per 100, 10s., fine.

Fruit and Forest Trees, fine, and equally low, and of the most approved kinds, warranted true.

Kitchen and Flower-garden Seeds, of the best quality, very cheap.

Greenhouse and Stove Plants, a splendid stock, at low prices. Catalogues on application gratis.

Orders (except for Forest Trees), above 5l., will be delivered carriage free, or allowed to London or within 150 miles of the Nurseries.—Address, WILLIAM MAY, Hope Nurseries, Leeming-lane, Bedale, Yorkshire. Post-office orders should be made payable on Bedale to JOHN MAY.

RAILWAY NURSERY, WATFORD; AND NURSERIES, RICKMANSWORTH.

E. R. GREENUS, from his proximity to the Watford station, on the London and North-Western Railway, begs to say that he has an opportunity of executing all orders conferred on him with the utmost dispatch.

E. R. G. has from 2000 to 3000 fine Standard and Dwarf ROSES, of the best and most approved sorts, to dispose of at the most reasonable prices; as also Standard and Dwarf Trained Fruit Trees, strong Standard do. for Orchards, with a collection of fine Evergreens, Flowering Shrubs, Piouses, &c., all of which will remove with excellent fibrous roots, and without the least danger; and the Evergreens with balls of earth attached to them, as, from the nature of his Nursery Grounds, *no large roots* are made, and, consequently, no cutting and amputating them in removal. All sorts of Agricultural and Garden Seeds, of best quality.

N.B. Carriage paid to London, or within 20 miles, on all orders above 2l. Reference required from unknown correspondents.

All letters to be directed to Rickmansworth.

CUT FLOWERS.—Gardeners or others having Cut Flowers to dispose of are requested to communicate with W. H. MAITLAND, Seedsman, 41, Great George-st., Liverpool.

CINERARIA "SEA-NYMPH."

JAMES MACINTYRE, in offering this new CINERARIA to the Nobility, Gentry, and the Trade, begs to state that, in point of novelty, beauty, and symmetry of growth, it is unsurpassed by any of this class of plants sent out for many years, and may be briefly described thus:—Colour pure white, tipped with ultra-marine blue, and flushed with rose; habit, dwarf and robust; a very free bloomer. Its striking peculiarity and beauty consists in the two very distinct colours, forming two distinct rings, the inner one a pure white, and the outer one a rich lively blue, flushed with rose. The white stands boldly out, whilst the rose shading on the outer margin of the blue circle, gives to the whole an ease and elegance not frequently met with.

Plants of the above will be ready for delivery early in March, at 5s. each; and as the stock is limited, early orders are particularly requested, and will be executed in strict rotation. The usual discount to the Trade.

Catalogues of stock cultivated for sale, at the Taunton Nurseries, may be had on application.

Taunton Nurseries, January.

The Gardeners' Chronicle.

*SATURDAY, JANUARY* 25, 1851.

FASHION is a despot that exercises influence everywhere, tyrannising over our gardens as much as our clothes and manners. Right in some things, reasonless in many, fickle in all, she compels her unreluctant votaries to shift and change incessantly their affections, their sympathies, their habits. Food is no more beyond her control than dress; and if there is little resemblance between a modern kitchen and one of the last century, so is the old kitchen-garden equally changed. It must be owned that this is often for the better: but it is by no means clear that it is always so; for change is not the same as improvement, however firmly restless people may believe it to be.

It is now a year since we ventured to take by the hand and reintroduce to the polite world an old discarded favourite whose place had been usurped by things no better than they should be; and we have the satisfaction to know that *Mache* is already in high favour with all persons of good taste, or lovers of easy digestion. To-day we beg permission to present another candidate for readmission into good society.

In the wilds of Siberia and Tartary there grows a plant of noble stature, clothed in purple or green vestments, the glory of those regions, though but of only annual existence, which our forefathers obtained at a period so remote that its introduction is lost in antiquity. Of their gardens it was one of the proudest ornaments and the most useful; by degrees its descendants spread over the allotments of cottagers, till at last, become vulgar in the eyes of fashion, it disappeared so entirely from cultivation that even experienced gardeners have forgotten its very existence; so that when some lingering descendant of the race chances to reappear, a limb is sent to London for a name and history. Some, indeed, profess to know it, and call it Spinach; but this false name only shows yet more plainly how utterly its memory has passed away. It is thus spoken of by a correspondent near Yarmouth:

"I grew it last year for the first time; it is a large sort that will stand two or three months in the summer time before it seeds; it grows from 4 to 6 feet high, with large leaves, more like Cabbage leaves than the old round Spinach. I had the seed from the captain of a trading vessel; only six plants came up, and they supplied the family with Spinach two or three times a week, all May, June, July. It is better flavoured than the common round sort, and does not waste so much in boiling. I sowed it the second week in March. I never saw any till last year, and no one in this part knows anything about it. I think no one ought to be without it who likes Spinach."

The seeds he sent are represented in the annexed cut. They are small pale-brown, flat, round bodies,

enclosed between a pair of dry round leafy valves, growing in ample bunches from all the upper part of the stem. Botanists call the plant *Atriplex hortensis;* the French *Arroche;* our old herbalists *Aurache* and *Orache;* under which latter name it may still be bought of the English seedsmen. In France, indeed, it is in as much request as ever, being there employed both as Spinach and as a means of softening the acidity of Sorrel. The second names given it by the French, *Bonne-Dame* and *Belle-Dame*, evidently point to the usefulness and beauty of the plant.

Its use as Spinach is undoubtedly of great antiquity; it seems in fact to have been the plant thus employed before the present garden Spinach came from the Holy Land. But it was valued not merely as a capital summer pot-herb; it had considerable medical reputation, in common with many other plants that possessed the important quality of doing no harm, if they conferred no benefit.

"Green Orach, bruised," says REMBRANDT DODOENS, through his translator HENRY LYTE, "is very good to be laid upon inflamations and hot swellings. That of the Garden, at the beginning of the swelling or inflamation; and the Wild, at end or going away of the same. With saltpeter, honey, and vinegar, it is laid to cholerike inflamations, called wild fire (because it doth waft and consume the member it is in), and also to the gout. The often use of Orach ingendreth many infirmities, overturneth the stomache, and causeth diverse spots, freckles, or pimples to arise in the face, and all the rest of the body. Also it is hard of digestion, as saith DIOCLES and DIONYSIUS."

In like manner old GERARDE tells us what was thought of it in his days. "ORACH, saith GALEN, is of temperature moist in the second degree, and cold in the first. DIOSCORIDES writeth, that the garden Orach is both moist and cold, and that it is eaten boiled as other Salad herbs are, and that it softeneth and looseth the belly. It consumeth away the swellings of the throat, whether it be laid on raw or sodden. The seed being drunken with mead or honied water, is a remedy against the yellow jaundice. GALEN thinketh that for that cause it hath a clensing quality, and may open the stoppings of the liver."

Without vouching for the truth of what may have been said by GALEN, or DIOSCORIDES, or DIOCLES, or DIONYSIUS, we can answer for the excellence of Orache as a vegetable, whether employed in the

French way or fairly treated by any cook who can boil a Potato. And with this character, and the following extract from LOUDON, we dismiss it.

"The leaves are used as Spinach, and sometimes also the tender stalks. The stalks are good only while the plant is young; but the larger leaves may be picked off in succession throughout the season, leaving the stalks and smaller leaves untouched, by which the latter will increase in size. The Spinach thus procured is very tender, and much esteemed in France. The Orache is raised from seeds, which may be sown early in spring, in drills 2 feet apart, the plants being afterwards thinned out till they are 2 feet distant in the rows. A second sowing, made about the middle of June, will ensure a succession of leaves; but the size and succulency of these will of course depend a good deal on the richness and moisture of the soil. (*Gard. Mag.*, vol. ii., p. 178.) *To save Seed.*—Leave a few plants of the most tender and succulent constitutions to blossom, and they will produce abundance of seeds in August."

---

WE published, at the close of last year, a brief account of some experiments now in progress, ON THE ABSORPTION OF NITROGEN by plants from the air; and on the influence of ammonia on vegetation, by M. Ville, which are described in the *Comptes Rendus*. As this is not merely a subject of scientific interest, but also one of great practical importance, we shall again draw attention to M. Ville's experiments, and briefly state some of the points which bear upon the effect in question.

Thirty years ago, the importance of nitrogen as an element of plants, was scarcely known or acknowledged by any one. DAVY, and the chemists who preceded him, spoke of it almost in the light of an accidental impurity; and it is only within the last 20 years that we have heard much about the importance of this substance to plants. Investigations into the nourishment of animals very naturally led to the recognition of nitrogen as an important element of plants, because, as that peculiar gas was found to be a component of most animal substances, and to exist, in considerable quantity, in the flesh and blood of all animals, physiologists soon began to look at plants, as the probable source of this substance, and arrived at the conclusion that vegetable food must be chiefly valuable, in proportion to the quantity of nitrogen which it contained. In fact, there were only two sources whence herbivorous animals could well be supposed to derive nitrogen, and these were, the atmosphere and their vegetable food. Experiment soon showed that such animals could not, by any arrangement, be made to thrive on food containing no nitrogen, even though they were supplied with plenty of fresh air; that, in fact, they could not thrive unless they were fed with vegetable matter containing nitrogen. A few years since, this conclusion was still further confirmed, when it was ascertained by direct chemical analysis, that the substances which exist in the blood of animals, and which are necessary to their growth and to the development of muscle, really and truly exist ready formed in those plants which constitute the food of animals.

The true source of the nitrogen which exists in animals, was, however, only half made out; it was satisfactorily established that though they might, and very possibly did, derive some small portion of it directly from the air, yet that the greater part must be obtained from plants. The next question of course was, whence then do plants derive it? This enquiry is still undecided, though certainly there is a great mass of evidence, all tending to show that like animals they do not absorb nitrogen in the free state, but only in a state of combination, and as a compound already formed by some other agency. Between plants and animals, however, there would seem to be this important distinction, that whilst the latter absorb nitrogen in the form of an organic combination, that is to say as vegetable matter, plants absorb it in the form of an inorganic compound; it being their especial office to combine it with other substances, and so form or elaborate organic matter fit for the nourishment of animals.

The great majority of facts tend to show that plants, though they grow in the free and open air, surrounded therefore with plenty of uncombined nitrogen, absorb little or none of it; but that they require to have it previously combined by some chemical process with another element, either oxygen or hydrogen. The experience of practical men as to the growth of plants, and the influence of soil and climate on their development, and more especially the action of manures, all lead to the conclusion that ammonia and nitric acid, even in minute quantities, exert a very remarkable influence on vegetation, which is healthy and luxurious when they are present, and comparatively sickly and weak if they are altogether excluded. No known practical fact, and no accurate physiological or chemical experiment, has been adduced to bear out the supposition that plants ever directly absorb nitrogen from the air. On the other hand, there are thousands of facts which prove that both ammonia and nitric acid are eagerly absorbed by plants; they grow with remarkable vigour, and, on subsequent analysis such plants are found richer in nitrogen than other plants not so fed. The simple and evident conclusion to which this seems to lead, is, that though it is not proved that plants are wholly unable to absorb any of the free nitrogen of the air, yet, that under all ordinary circumstances, they must derive their nitrogen from some other source; that source being most probably ammonia and nitric acid.

Lengthened and ingenious calculations have been made to ascertain, whether it is possible that plants could obtain from the air and soil a sufficient quantity of ammonia and nitric acid, to supply them with all the nitrogen which they require; but these calculations are all more or less founded upon mere assumption. The fact is, that though it has been known for a considerable time, that the air frequently contains a small quantity of ammonia, yet in consequence of its great volatility, and the facility with which it is absorbed by water, and still more in consequence of the very minute quantity of it which can at any time exist in a given bulk of air, its detection and estimation by chemical means is exceedingly difficult, not to say almost impossible. In many inquiries of this sort, facts may be satisfactorily established by induction, and we may feel tolerably well convinced of their truth, without being able to settle the question beyond all dispute by direct and unexceptionable evidence. There is no doubt whatever that there frequently exists in the atmosphere a very considerable quantity of various foreign matters, which though they are too subtle to be detected by the use of chemical tests, may nevertheless be sometimes shown to be present, and which produce various important effects on the health of animals, and also in other ways. It would be well if the attention of chemists were drawn to this very curious and interesting subject, for there can be no doubt that improved modes of detecting the presence of foreign matters in our air would lead to the most important practical results in a sanitory point of view. The power which steam and vapour generally possesses, of assisting in the evaporation of less volatile substances has been long known, but very little is known of the extent to which this influence extends in nature, or the effects to which it may give rise. Recent experiments have shown that steam is able to carry away, in a state approaching nearly to the form of vapour, the most fixed substances, such as soda, oxide of iron, &c.; and there are others which render it probable that steam is also sometimes able to cause the volatilization of some forms of organic matter. If this should prove to be really the case, it will lead to very interesting inquiries respecting the spread of disease in the air, and the nature of contagion.

Although, however, we have difficulty in obtaining direct evidence of the existence of either ammonia or nitric acid in the atmosphere, yet we are sure it must frequently exist in the air, because we know that all organic matter, when in a state of putrefaction, evolves ammoniacal gas. It is also evolved constantly by the bodies of all living animals, constituting an ingredient of their perspiration; and it is also continually being formed and poured into the atmosphere by the combustion of coal. Again, in the formation of nitre in soils, we have further evidence of the presence of ammonia. When a soil contains potash or some similar base in contact with putrefying animal matters, nitric acid is formed, but in such cases the nitrogen appears to pass through the intermediate state of ammonia; that is to say, that the putrid matters do not at once generate nitric acid, but that they form ammonia, which, in the presence of potash, &c., is in turn converted into nitric acid. In soils which have been manured it is easy to trace the origin of nitric acid, but in those soils which have never been artificially manured in any way, but which continue from time to time to yield fresh crops of nitre by mere exposure to the air, there appears little doubt that the nitric acid thus formed is produced by the action of potash naturally existing in the soil, on ammoniacal vapours which are brought from a distance in the air.

The quantity of nitric acid formed in the soil in many places, particularly in the vicinity of towns, is probably even much larger than is generally supposed. The earth below the pavement of towns, and that surrounding drains even to a very considerable distance, frequently contains traces of nitric acid in combination with lime and potash; and even the water of the surface springs, such as those which generally supply street pumps, are in many cases found to contain small quantities of these salts. There appears, in truth, to be no doubt whatever that a very large quantity of ammonia is constantly being formed and given off into the atmosphere, the greater part of which, however, is brought down again, and spread regularly over the surface of the earth by dew and rains. It has been questioned whether that portion of rain-water which a given number of plants receive and absorb by means of their roots, could contain ammonia enough to supply them with the requisite quantity of nitrogen, and it has been supposed that a heavy rain must of necessity soak far into the soil, and consequently wash away, and remove altogether beyond the reach of the extreme roots a very large proportion of the ammonia thus brought down from the air; that this latter, however, is not the case, has been satisfactorily proved by recent experiments, to which we shall shortly draw attention. Such a calculation is necessarily vague and incomplete; but as far as can be judged, it appears most probable that plants are able to absorb enough nitrogen from the air and soil to supply all their wants, in the forms of nitric acid and ammonia.

It is obvious that this inquiry has a very important direct bearing upon the use and action of manures. It is pretty well ascertained that the two most valuable ingredients of dung, and similar rich manures, are the phosphoric acid and nitrogen which they contain; and it is plain that the quantity of the former which plants are able to take up must depend upon the proportion of it naturally existing in the soil, or artificially added to it. In the case of ammonia, however, it must be different, if the quantity which plants contain is independent of the soil altogether, and depends on the proportion which they are able to collect from that unlimited source, the atmosphere. It is evident that if plants are able to appropriate the nitrogen of the air, our views, respecting the application of manure, must be considerably modified; because the question will no longer be, how to fix ammonia, and how to supply plants with a certain quantity of nitrogen in a state of combination, but rather how to bring plants into that state in which they are best able to appropriate the nitrogen of the air.

Always, therefore, bearing in mind, that it is by no means impossible that plants may absorb a portion of free nitrogen, we must say that probability is much against it. At the same time the inquiry is one of great interest, and well worthy of most careful investigation, but the experiments must be devised with judgment, and carried on with the most scrupulous care, and unwearied attention; for the difficulties which surround such investigations are very numerous, and without constant study some of them would be sure to escape the observer's notice. In all experiments on the growth of plants under glass cases, and in confined portions of air, there are more or less unnatural conditions introduced, which render it very difficult fairly to compare the results obtained, with those which are observed when plants grow under natural circumstances, or in the free and open air. In most plants we observe a superabundance of means; organs are provided more powerful or more abundant than are absolutely necessary to carry on the healthy functions of the plant; instead of merely forming a few seeds, a plant produces hundreds or thousands; and in a great many cases much more organic matter is laid up for the use of each seed, than under any ordinary circumstances the embryo can possibly require. Some seeds contain so abundant a store of food, that even if half of it is destroyed accidentally, or purposely removed, the remainder is sufficient to nourish the embryo, and ensure the growth of a perfect plant. Others again, such as the seeds of fruit trees, are not merely thus amply provided with organic food, but in addition they are furnished with a certain quantity of manure; for the fleshy covering which constitutes the edible part of the fruit, as it decays in the soil, or on the ground when the fruit falls and rots, forms a quantity of rich mould for the roots of the young plant, when the seed subsequently germinates. The beneficial consequences which result from these curious and beautiful provisions are evident throughout the whole vegetable kingdom. Amongst other effects thus produced is the power which plants have of withstanding the influence of various external agencies, and other accidental effects, which would inevitably destroy them if it were not for their great vitality, and the remarkable power which they have of adapting themselves to surrounding circumstances.

This great vitality of plants, which infinitely exceeds that of animals, and the extraordinary way in which plants live and continue to grow, sometimes under the most disadvantageous circumstances, and in the most unnatural situations, is, however, rather unfavourable, in some respects, to experiments on the nutrition of plants. When an animal is starved to a certain point, it will then greedily devour food

which, under ordinary circumstances, it would not touch—a fact which is often illustrated by the introducers of some marvellous new kind of fodder for cattle; but in such cases it is frequently found that though they will eat it when they can get nothing better, yet they derive comparatively little benefit from it; and the fact that they are able to live upon it is no proof that it agrees with them, or can be fairly called a good and wholesome food. In the case of plants all this appears to hold good, but to a far greater extent; for when we take away from them, or diminish their supply of what constitutes their food, or is in any way necessary to their healthy growth, we generally find that they make extraordinary efforts to continue growing, and to struggle on as long as they have a chance. Some of Saussure's experiments well illustrate this, for he found that when certain plants were confined under glass bell jars, shut out from all connection with the atmosphere, and not in any way supplied with gaseous food, they still continued to grow, but they fed upon themselves; the weakest leaves withered and faded, and by their decay furnished carbonic acid, &c., which enabled the stronger young shoots to continue their growth and development. From these, and many other similar facts, we may be led to conclude that, even if it should be proved that under unnatural circumstances plants are able to absorb and appropriate the free nitrogen of the atmosphere, it will not at all follow as a necessary result, that under natural circumstances, they ever do so absorb it. We shall again advert to this subject on a future occasion.

## BRITISH SONG BIRDS.

No. XV.—We may now consider all our preparations for enjoyment "complete;" for I believe very few matters of essential import, connected with an aviary, have escaped notice.

The first thing now to be done, is to make yourself thoroughly acquainted with the natural history of every bird in your possession. You could not do this satisfactorily, unless you had several of the same species; for to judge of all by one, would be manifestly incorrect. Three of each, I think I may conscientiously say, will suffice for your purpose; if you chance to have more, so much the better.

You will find there are many books extant, which profess to treat logically of "British Song Birds;" and I recommend, if you feel so disposed, a perusal of the whole. You will then satisfactorily convince yourself, how totally insufficient they are to teach you any large amount of practical knowledge. They appear to me to be mere servile copies, one from the other.

For several years, I kept a regular "diary" of observations; and I most earnestly advise every possessor of an aviary to do the same thing. They will feel, as I have ever done, fresh sensations of delight every time they refer to their note-book. Truly different indeed will be their own remarks, by comparison with those they have been in the habit of reading in printed books!

You will first note the peculiarity in disposition of each separate inmate; observing, for instance, in whose company the canary and goldfinch are principally found; also the linnet, chaffinch, bullfinch, &c. Certain birds you will find to be of solitary, retired habits—others, gregarious; and many, partial to mixed society. Every day will unfold some new and interesting discovery, and bring to light some Pylades and Orestes vowing eternal friendship for each other, &c.

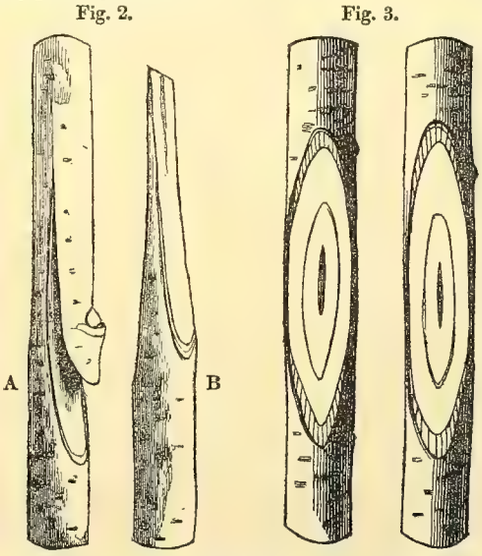
It is beyond all question, that social intimacies *are* formed in an aviary, and that they are of long continuance. This remark applies as well to male birds, as to those which live together in pairs. The most singular instance of attachment, in illustration of the latter, that I can call to mind, is that of a pied mule canary (a hen), associated with a cock robin. The mutual affection of this out-of-the-way pair was as strong as it was remarkable. The two were never to be found apart. The mule, which I had originally imagined to be a male bird, and purchased as such, in due course laid three eggs. They were artfully concealed behind a part of the lining of the wall, in some dried chickweed. I removed these eggs as quickly as possible, and placed them under a hen canary, which was just beginning to sit, in a breeding cage.

There being a wise and universal law in nature, that no mules, males or females, can reproduce their own species, I felt quite confident in my own mind of what must be the necessary result with regard to the hatching of the eggs. There was, of course, no embryon—consequently, no offspring. I merely experimented in this one extraordinary instance, to satisfy some amateurs, who were morbidly sanguine of a contrary issue.

It is worthy of notice, that immediately on the removal of the eggs from their hiding-place, both the robin and the mule grew melancholy. Their affection was, if possible, redoubled; but, sick at heart at the frustration of their fondest hopes, they pined gradually away, and found a resting-place in the silent grave. "In their deaths they were not divided:" I placed them in a small deal box, and buried them beneath the same tomb.

When you have carefully studied the dispositions and habits of the hard-billed birds, you will find that in the soft-billed, you have yet more to admire. These little creatures, more particularly those known as the "Warblers," have all of them a soft, silky, plumage; and are, in point of substance, "light as air." Hence their sleekness, trimness, and fair symmetrical proportions. The time to view them in their glory is in the morning, while feeding; or when the sun streams into the aviary, through the windows. They may then be seen basking in the sun's rays, ranged on one of the long perches in the front window; or lying stretched out at full length on the margin of the rippling fountain.

The "Warblers" are also remarkably fond of sitting opposite the looking-glasses; before which they habitually make their toilet, and perform some excruciatingly-droll antics. If ever birds may be said to "think," it is at such seasons as these. It is long before they can bring themselves to believe that the reflection of their own person is not in reality another bird. Many are the assaults committed on the face of the glass in consequence!



To get these little rogues, one and all, to be your associates, you need only provide yourself with any of the luxuries in which they delight—such as a few woodlice, ants, spiders, mealworms, or earwigs. Your advent will then be heralded with a rapturous song. One or two of these savory *morceaux*, kindly presented with the hand, will get rid of all *mauvaise honte* on their part, and cause you to be "A 1" in the estimation of the colony. *William Kidd, New-road, Hammersmith.*

## GRAFTING.

No. IV.—Inarching on Stems or on Branches; *fig.* 2 (*Greffe Monceau of Thouin*).—This mode of inarching may be employed for the same purposes as that of the former, or Michaux inarching; and it answers better for the propagation of evergreen plants and others; but in all cases in which it is adopted, it is better to operate with wood of one or two years old, and that the portions joined should be of the same age and thickness.

*Operation* (*see fig.* 2.)—Prepare beforehand a stock, of which the dimensions shall be regulated by the place where we would wish to join it to an allied tree, of the same thickness; make in the latter a cleft through the substance of the young wood; it should be made from below upwards, and prolonged even to the medullary sheath, dividing it into two nearly equal parts (see letter A); then the other (letter B), is cut long wedge-shaped, for being inserted into the cleft, so as the whole may perfectly coincide.

Fig. 2. Fig. 3.

When we wish to employ this mode of inarching for propagating rare plants, difficult to unite by other means, we rear the stock in a pot to the height which the plant to be inarched may require. When well taken, the inarched portion is detached from the parent plant, to form a distinct individual, depending entirely on the stock, which has no other merit than that of being vigorous, and of belonging to the same family as the species we wish to increase.*

Hymeneal Inarching (*Greffe Hymen*); *fig.* 3.—This may be employed for the same purposes as the preceding; if it be intended to form *kiosks*, pavilions, or arbours in gardens, or elsewhere, we may unite three or four trees. I have inarched some in this way, under which a coach could pass in every direction. It may be practised more simply with two subjects, such as are represented in the engraving, and in this way they may be used instead of posts for rural gates or doors

*Operation.*—Prepare two plants or trees of the same height and thickness; bring their tops together at points where they readily touch, in consequence of a slight bending; cut from each of them at this place a longitudinal slice, of equal dimensions, deepest in the middle, where it should raise a small portion of the medullary sheath; thus prepared, the two cut surfaces are united, so as to mutually cover each other, and they are then firmly secured by means of ligatures, &c. If the parts are of the thickness of the little finger, and this should be the maximum, their consolidation would be aided by a wire nail, driven through the junction. If the tops of the respective trees thus inarched are intended to form an aggregation, some precautions are necessary for preserving an equilibrium in their vegetation. In employing this mode for the propagation of rare plants, these are suited with young stocks of kindred species, reared in pots, &c., and as soon as the organic union is well-formed, the head of the stock is cut off a little above the union; the sort inarched upon it should be separated from the stool or parent plant, by the proceeding indicated in treating of the previously-explained mode of inarching. *Translated from the French of D'Albret.*

* This separation or *severage* is often prepared for by a notch, or, what is better, an annular cut, which renders the final separation less hazardous.

## MARKET GARDENING ROUND LONDON.

No. IV. Carrots.—The Early Horn is the only kind employed. It is sown in frames and hooped beds in November and January. The plants are thinned out to 4 inches apart. Long Carrots for winter use are grown largely in the red sandy soil in the lower parts of Surrey as well as in Bedfordshire, &c.

Early Turnips.—The Early Stone or Dutch being in great demand in spring, various ways of producing it are practised, such as growing it in frames; but the best plan is to raise it like Potatoes, in hooped beds, *i. e.*, in trenches dug out and filled with 2 feet of hot dung. Sow in February, hoop and cover with straw, and expose the plants daily, the quality of a Turnip depends much upon quick growth and plenty of moisture. Late Turnips are not cultivated upon the dear land about London, they generally come from 10 or 12 miles off. The reason why a farmer cannot raise Turnips like a gardener is owing to the poverty of the land; so small a seed wants immediate and available nourishment the moment it vegetates. It is then able to grow away from the fly, and if the seed was mixed with Irish peat charcoal it would greatly assist in effecting this. Early and forced Turnips fetch from 2*d.* to 3*d.* apiece in Covent Garden market.

Onions.—The ground for the main crop is dressed with strong dung, such as night-soil or cow-manure. The seed for this crop is sown in February or the 1st of March, in beds 5 feet wide, the soil from the alleys being thrown on to cover the seed. The beds are then raked, and a light wooden roller passed over them. When up, small two-inch hoes are sent through them, which is all the labour they receive, the ground being so clear of insects, owing to its being often turned over. Market gardeners seldom fail to obtain a good crop of Onions. Where insects occur, however, a good dose of salt and soot sown with the crop will kill them. Another way of managing Onions is to sow about the middle of August, to allow them to stand in beds all the winter, and to plant them out on well prepared land 4 inches apart in the rows, and 6 inches row from row. A third plan is to save all the smallest bulbs, and plant them out in February, the same distance apart as the last.

Horse-Radish.—The root is like that of Seakale, as respects propagation; the whole roots are thickly studded over with eyes, and in order to make a new plantation all that is needed is to plant small pieces of them, or the tops cut off, in the bottom of a trench 1 foot apart each way, and about 15 inches deep. Horse-Radish is generally planted in February. When it comes up all the weakest shoots are pulled up, leaving only one; and should any more make their appearance afterwards, they are destroyed by the hoe. When taking up time arrives in autumn they are trenched up, cutting them down to about a foot or more with the spade. They are knifed after the mould is moved. The roots are sorted into best and second-best. The best are tied into bundles of 12 heads or more for market; the ground is then well manured with rotten cowdung, and the roots are again left to come up for another year's crop. The best ground for Horse-Radish is the "Jerusalem level" between London-bridge and Greenwich, and some parts of Battersea, where the river Thames, in days of yore, had thrown up a deep deposit. This ground also produces the best Seakale; hot dug ground or clay renders it hard and indigestible.

Winter Radishes.—These are sown from the first to the last week in December, choosing as warm ground for the purpose as possible; but acres of them may be seen in very exposed places. The ground being prepared the seed is sown broadcast. The alleys are marked out, and the mould from them is thrown over the seed. A wooden rake is then used to make all level; no iron rakes are employed in market gardens. After sowing, straw which has been previously shaken out of the London stable manure, is put over the beds 2 or 3 inches in thickness. When the plants come up, which depends upon the winter, the straw is removed every day and put on every night until all danger from frost is past; it takes 5° to hurt a Radish after it is half-grown. When off, the ground is again dug, for French Beans, or Vegetable Marrows, &c. *James Cuthill, Camberwell.*

## Home Correspondence.

*Some Facts about the action of Cold on Plants.*—Facts, however trivial in themselves individually, become in the aggregate of immense value in building up a theory, or illustrating a practice; for we must recollect that a theory is as often the child of experience, as that practice is illustrated by it, although such may not appear evident at the moment. The action of cold on plants is of vital importance to the practical gardener, as well as interesting to the natural philosopher. The relation of temperature to the healthy development of vegetable life is as yet but imperfectly understood. Every day, however, adds useful knowledge on this head to our acquired stock. In the early spring of 1846, a quantity of Geraniums and other soft-wooded

plants were despatched by railway, at the station of which they arrived safely enough, but having to be conveyed some 20 miles by waggon on a frosty night, and not being properly protected (although the baskets containing them were matted in the ordinary way) they were completely frozen through when they arrived at their destination, by daylight in the morning. So much were they frozen, that the succulent tops, for several inches, were apparently masses of ice, and nearly the whole of the leaves had suffered more or less. On the extent of the damage being known, the whole of the plants were quickly removed to a dark cellar; and, to make "assurance doubly sure," a covering of mats, supported by a temporary frame-work, was thrown over them. Water, only removed from the freezing temperature, was freely applied to the foliage, and no light admitted for 24 hours. On removing them, the damage they had sustained was but nominal. Scarcely a leaf had suffered, except such as had been bruised in the unpacking. Every leaf, or part of a leaf so damaged, had to be removed. Another instance:—On a festive night, in mid-winter, the person in charge of a conservatory forgetting, or by procrastination omitting to apply the necessary artificial temperature, to expel the frost (for it had set in severe rather unexpectedly) found, on his entering the house at 4 o'clock in the morning, that the tender plants were much frozen. He applied fire to the boiler, raised the temperature a degree or two above freezing, and then liberally applied cold water with the syringe. The result was that nothing beyond a few leaves on a stray shoot or so evinced any damage, and by sunrise all was as promising as could be wished; so completely were the plants recovered, that the circumstances would never have been reported in the *Chronicle* had not the delinquent revealed the mishap after all danger of detection was past. One more:—A house of Geraniums was penetrated by frost, the plants were much frozen, and the frost was on the increase when the circumstance became known in the morning. Cold water was in this case applied, but without the precaution of raising the temperature above freezing point. The result of course was that the water, as soon as it fell on the foliage, became ice, till the plant looked encased in candied sugar. The more water the greater evil. This detected, a fire was lighted, and the necessary temperature acquired, when the result was all that could be wished. Sunlight was prevented reaching the plants till a recirculation of the fluids had taken place. In all similar cases light should, if possible, be excluded; in fact, every incentive to a rapid reaction of the vital powers should be applied only in the most limited degree, increasing stimuli with the requirements of the plants retarding rather than accelerating vital action. As regards the action of light on plants, a wide field is open to the ingenious experimentalist. Let a given number of plants be frozen; admit to some light in its ordinary condition, from others exclude the chemical ray; from more, both the chemical and heating ray; to others only admit the luminous, or vary its application in the many ways which will occur to the chemist. The result must be of importance alike to the gardener or the pure man of science. *G. L.*

*Hint to Brickmakers.*—Ever since the repeal of the brick duties, I have been watching in vain your advertising columns, in the hope that some spirited manufacturer would provide sundry useful and ornamental matters required in gardens. What an excellent material would baked earth be for the architectural balustrades of garden terraces in various styles, especially that which is now so common, the Elizabethan, solid, cheap, and in good taste. How often are we in want of good pedestals to raise up choice plants and flowers to the eye in our garden walks, and what use might we not make of well-designed borderings, curved and straight, to enclose and contrast with the glowing masses of our flower beds in the summer? We all know that some such articles are offered in artificial stone, iron, and zinc; but if we are guided by the lamp of truth, so ably held forth by Mr. Ruskin, we shall turn aside from sham stone, the treachery of zinc, and the harshness and want of fulness of iron. Real carved stone is indeed admirable, but too dear for most people, particularly where there is no stone in the natural strata near at hand. There are indeed some good garden seats, in the manner of the Chinese perforated squares, made by Minton, in the Potteries; and there have been some elegant cornices, and other architectural ornaments produced by some patentees at Tunstall; but the wants of gardens have not been responded to; and there yet remains unoccupied an extensive field of speculation to adapt terra-cotta to horticultural purposes. *W. H. B., Uckfield.* [We quite agree with our correspondent. In fact, the repeal of the brick duties has hardly been felt as yet.]

*Earthing up Vegetables.*—Mr. Cuthill, in his very interesting and instructive papers on "Market Gardening round London," tells us that Cabbage plants "are never earthed up—a bad practice for almost any crop." The principal use of moulding up to growing plants is to steady them, and where the soil is light and the situation is exposed to strong winds, that process is absolutely necessary; at least, I find it so, and have never observed it in any way injurious to the Cabbage tribe. Late Broccoli I mould up with a vengeance, my practice being to take out every row in autumn and lay them down in the usual way; those that remain, being then 4 feet apart, have the soil from between the rows banked up (like earthing Celery), so as to cover the whole of the stems up to the lower leaves, which enables the plants to stand erect even in the roughest weather, and also protects them in a considerable degree from the influence of severe frosts. When the stalks are dug up in spring, many of them will have pushed a number of fibrous roots into the soil that surrounded them. I may here mention—for the benefit perhaps of some who, like myself, never have their eyes gladdened by the sight of a two-horse load of dung "emptied down (as if it were a barrowful) for every 30 feet" of ground—that these said Broccoli stalks make a capital dressing for Potatoes when chopped to pieces and dug in as manure. In poor sandy soil I have found green manure of this kind more beneficial to Potatoes than a dressing of the half-decayed leaves sparingly adulterated with stable litter, which many gardeners are obliged to substitute for dung. *J. B. W.*

*Covering or Mulching the Soil in Summer.*—You may have observed the practice which prevails in some gardens of covering the earth in summer with moss or stable litter. I happened lately to be in company where the propriety of this practice was discussed, and I now trouble you with some of the arguments that were urged for and against its use. One person (Mr. A.) asserted that mulching or covering the earth in summer was good practice, justified by experience, and based on sound principles, because, as he alleged, the temperature of the ground was thereby more uniformly maintained, evaporation lessened, and the plants benefited by the gradual decomposition of the covering. He further stated, that plants received the greater part of their nourishment from the atmosphere, and that they are less indebted to the earth for their nourishment than is commonly supposed; and sustained his argument by stating that Wheat, or other seeds, placed on glass, and covered with straw, vegetated luxuriantly. On the contrary, (Mr. B.) asserted that covering the ground in summer was bad both in practice and principle, because it was, in that case, impossible to stir the earth, and keep it open to the solar and atmospheric influences, which invigorate the roots, and consequently benefit the the plants. He, moreover, observed, that these coverings in summer kept the roots of plants in a cooler state than their tops, and thereby interrupted the equable flow of sap, from which cause both the flowers and fruit were often damaged. He also remarked, if plants are so little indebted to the earth for their nourishment (as Mr. A. had alleged), why then were alternations of crops necessary? For if plants mainly received their support from the atmosphere, it would, in that case, be unnecessary to remove them into fresh ground, as the atmosphere might supply their exigencies in one place as well as in another, an assumption, to which world-wide experience is opposed. A learned physician, who was one of the company, here startled us, by saying that by covering the earth, electric action was promoted, which is always beneficial to plants. Now, in these discrepancies of opinion, and "oppositions of science, falsely so called," we, "simple" amateurs, who look up to you as our "guide," respectfully request you to inform us which is the true philosophy and right practice in this case. *An Inquirer.* [We refer you to what we have said in a recent Leading Article on this point.]

*Fruit Tree Borders*—As concreting the foundation and surface of the borders of fruit trees appears to be recommended on good authority, I think the object would be better attained in point of ease, economy, and appearance, by the use of either slate, zinc, or galvanised iron, and drain pipes for the admission of air. To concrete the foundation and surface is more expensive than appears at first sight, on account of the time and labour required; and either slate, or sheet zinc, or galvanised iron, laid on the surface could be easily moved, and would not look unsightly. In some districts slabs of slate would cost very little, in others zinc or iron would not now be expensive. *H. T., Bristol.*

"*Packets*" *of seeds.*—The number of garden and flower-seed purchasers is increasing every year. Railways, and the general advance of civilisation, have multiplied the cultivators of both culinary and ornamental plants. Amateur gardeners, in the lower ranks especially, are appearing on every side. Now it is of consequence to such, and to many others, that they be able to purchase small quantities of seeds. But in the seed lists, below a quarter of an ounce, or a quarter of a pint, no weight or measure is to be found but the unsatisfactory quantity, "packet." A "packet" means anything, from a pinch to an eighth of an ounce. Now, I conceive that it would be useful to the public, and not unprofitable to the seed-sellers, to remove the word packet entirely from their lists. Why not, in weights, use the avoirdupoise drachm? And if less than a sixteenth of an ounce is sold, let there be half and quarter drachms. But, perhaps the seed merchants will object to the trouble of weighing such small quantities. Let them then imitate apothecaries in their prescriptions, and have recourse to fluid ounces and fluid drachms. The table for the latter will stand thus:

| pint | f. oz. | f. dr. |
|---|---|---|
| 1 | = 16 | = 256 |
| | 1 | = 16 |

Now a fluid drachm will be less than half a teaspoonful, and, of course, no farther division will be necessary. If complaints are made of the expense of attending to such a quantity of small parcels, let the seedsman charge so much per dozen for them beyond the cost of the seeds. The abolition of "packets" would be especially profitable to the principal seed merchants; for one of their packets, after it has travelled an hour by railway is divided by the country dealer into three or four "packets" with no diminution of price. *Sigma.*

*Royal Botanic Garden, Edinburgh.*—Having observed Mr. Balfour's letter, in your last volume, respecting the liberality of admission to this Botanic Garden, I beg to state the following fact. Being in Edinburgh, with my family, the summer before last, I took them to the Botanic Garden. I asked for admission to the houses and was refused, as they were not open without an order, except on Saturdays. I was referred to the curator's house in the garden, but there I could not procure an order, and we did not see them. It is, I believe, a condition on which a grant of public money for the support of those gardens is made, that they shall be open daily to the public. If so, we do not thank the curator much for that. But when we come to the part under his control, and find that the houses are only open to the public for three hours in winter and four hours in summer one day in the week, and that strangers are treated as I have above stated, we, on this side of the Tweed, cannot give him credit for much liberality, however we may admire his admirable treatment of plants, if we have an opportunity of visiting his garden between 12 and 4 on Saturdays—no easy matter for tourists. I have seen Heaths and Stephanotus better managed in those houses than anywhere else that I can remember; but if the public pay for their culture, they ought, I think, to be allowed to see them. *A. L. M., Lincoln.* [We insert this and similar letters because we agree in opinion with the writer, that what the public pays for should be freely open to the public at all reasonable times.]

*The Late Lieutenant Waghorn.*—On mentioning the deaths of distinguished men during the year 1850, a morning journal mentioned "Poor Waghorn!" The sound of the name should make Englishmen blush, and cause the ears of those in authority, both in the British Government and the Company's service, to tingle when they think of the manner in which Lieutenant Waghorn was treated whilst living, and how little his family have been considered now he is dead. If we turn to the history of men who have benefited their country by their talents, industry, and perseverance, we shall find few who have greater claims on our gratitude than Waghorn. It is quite unnecessary to enter into a detailed account of his exertions on behalf of his fellow-creatures. It will be sufficient to state that he brought India within six weeks of England. Surely all classes having friends in India must value the advantage of a quick and certain periodical communication with the East. Fathers, mothers, husbands, wives, brothers, and sisters, should vie with each other in paying a tardy tribute to the memory of the unfortunate and ill-used Waghorn, by immediately entering into a subscription for the purpose of placing his family above want. Horticulturists must not be omitted in the list of those who have been gainers by shortening the passage to India. Seeds and plants arrive in half the time they used to do, and are of course in better condition than when their journey occupied four or five months, and sometimes even more. I shall be happy to put my name down for 1*l.* 1*s.*, and I trust the love of justice so characteristic of Englishmen will induce many to follow my example. *Falcon.*

*Preserving Timber.*—Observing that an enquiry has been instituted upon the influence of paint upon out-door work, I am quite of opinion, as now applied, it in many instances is useless, and in many others injurious. Every description of timber work will last longer without paint than with it, unless the painting is done upon one side only. If an oak gate, for instance, however well seasoned by exposure previously, is kept constantly painted, it will become rotten, especially at the joints, laps, and mortices. Upon my farm the outer gates were kept painted, they are every one decayed; those put down at the same time not painted are perfectly sound. The black Huntingdon Willow will make paling almost as durable as Oak itself, if not painted; but if painted, soon becomes rotten. Laths made from this Willow are more durable than Fir, or even Oak, as rough cast laths. I can point out places where it has stood upwards of 40 years and is still sound. Stockholm tar is better than paint upon farm buildings and fences, and there coal tar will suffice. But if paint is applied it hermetically closes the external pores of the wood, and the fixed air acts internally (especially if assisted by moisture entering at the joints, or by having communication with the earth) exactly as dry rot. This is not the case with resinous woods. Paint preserves them greatly, and therefore all Fir sashes and framework of every description should be kept well painted. Elm is very liable to decay, but as weather-boarding is superior to Fir; and if kept tarred with Stockholm tar, will last a century. Oak gates, if painted only on one side, would be benefited, and the same of Oak weather boarding would be benefited. The main point to be looked to is, to paint the tenons before they are put into the mortices, or by tarring them the same object will be attained; and whether painted or tarred, or not, afterwards, the parts requiring preservation will be preserved. A friend of mine used to say, painting an Oak gate was like painting an old woman's face—it might make her handsomer, but could not make her younger. *Robert Baker, Writtle.*——Nothing can be more erroneous than to suppose that the application of tar is injurious to wood. If applied to "sappy" wood, or even to dry wood during damp weather, the effect produced will certainly not be beneficial, but will, in fact, be injurious, as tending to cause rot by shutting up damp within the pores of the timber, and excluding the air. I would recommend that all wood intended to be tarred, be allowed to become thoroughly dry before any tar or paint be applied, even if it takes a year or two to become

so, which it will do if green wood is used, as is often the case. A fine dry day, after a week or ten days of continuous warm weather, should be chosen for applying the tar, which should be used in as hot a state as possible. The result will be that the hot tar will be absorbed by the wood with its then open pores, like a sponge, and once there, wet cannot effect an entrance. Two coats of the following mixture properly applied, will last 10 or twelve years. Take two-thirds gas tar and one-third Stockholm tar, and after boiling them well, apply the mixture while in that state. Dealers in paints and anti-corrosives may say what they please, but I have proved that for the preservation of wood or iron, there is nothing equal to the above when well managed. My reason for mixing the two kinds of tar is, that gas tar, which is of a dry nature, but possessing a body, may be softened by the more oily Stockholm tar which wants substance. I mentioned in the *Chronicle* some time ago, that I tried the above plan for preserving iron hurdles now about 11 years since, and on examining some of them the other day, I found them still perfect. *G. F.*

*The "Observations upon Muling among Plants,"* in the last part of the "Journal of the Horticultural Society," have reminded me of a curious instance of cross-breeding which once came under my notice. A few flowers of the Chinese Azalea variegata (which is a mere variety of A. lateritia) were promiscuously dusted with the pollen of American Azaleas, Rhododendrons, and several varieties of Azalea indica, which happened to be in bloom at the time. The flowers so fertilised produced seeds, from which several plants were raised; but the constitution of them proved so extremely tender that, although I tried various methods of treatment, I found it impossible to make them thrive; and, after lingering in a weak state for several years, they all ultimately died. Some of these plants were so very different from their mother as to lead me to suppose that their male parent might have been either the Pontic Rhododendron or an American Azalea; for their foliage was much like that of some of the small-leaved Rhododendrons, and a flower-bud which formed on one plant was nearly as prominent as a bud of R. ferrugineum or hirsutum. This experiment, although conducted quite at hap hazard, seems to indicate the possibility of obtaining a distinct race of Azaleas, which, if amenable to culture, would no doubt be a valuable acquisition to our gardens. At any rate, it may be worth the while of professed hybridists to try the experiment. *J. B. W.*

*Rain.*—The following amount has fallen during these last six years at Bognor:

| | 1845. | 1846. | 1847. | 1848. | 1849. | 1850. |
|---|---|---|---|---|---|---|
| | In. | In. | In. | In. | In. | In. |
| January ... ... | 2.54 | 3.92 | 1.73 | 2 10 | 2.11 | 1.67 |

It is perhaps worthy of mention that this place is within 250 yards of the sea, and that this part of Sussex is very level, being about 10 miles from the Downs. *J. Graham, Bersted Lodge, Bognor.*——The following is the quantity which fell at Carlesgill, in the parish of Westerkirk, Dumfries-shire in 1850:

| | | | |
|---|---|---|---|
| Jan. ... ... ... | 3·40 | Brought over ... | 31·62 |
| Feb. ... ... ... | 10 38 | Aug. ... ... ... | 8·98 |
| March ... ... ... | 1·38 | Sept. ... ... ... | 2·53 |
| April ... ... ... | 5·59 | Oct. ... ... ... | 3·39 |
| May ... ... ... | 2·93 | Nov. ... ... ... | 10·67 |
| June ... ... ... | 4·34 | Dec. ... ... ... | 8·21 |
| July ... ... ... | 3·60 | | 65·40 |
| Carried forward ... | 31·62 | | |

Average fall for the last eight years, 57.89. Carlesgill is 24 miles direct north from Carlisle, 300 feet above the sea, and surrounded by steep hills, from 9 to 1200 feet high. April 20th, first swallow seen. 30th, cuckoo heard. May 5, ground deeply covered with snow, which fell from before daylight till 3 P.M. 7th, at 4·20 A.M., thermometer at 26°. 15, hoar-frost, and ice on the pools. June 16, hoar-frost early this morning. Aug. 20th, Potato shaws blackened by frost, growth consequently checked. 27th, 1·40 in. of rain fell in eight hours. Nov. 20 and 25, barometer at 27·85. 29th, at 8½ A.M., thermometer at 21°. N.B.—The barometer has been of very little use since the beginning of November, often standing comfortably at "fair," whilst it rained heavily. At this moment it is 29·65, though there has been a gale of wind, and rained for 16 hours at a time. *J. L.*

## Societies.

LINNEAN, *Jan.* 21.—W. YARRELL, Esq., V.P., in the chair. Mr. Gould exhibited a drawing, the size of life, of a new and very extraordinary bird, belonging to a genus and species entirely new, and which he had called Balæniceps Rex. It is an inhabitant of the interior of South Africa, and has the head and bill of a pelican, and the feet and legs of a crane. It stands four feet in height, and its principal food consists of young alligators. The bill is not so large, but stronger than that of the pelican, and its feet are not webbed.—A memoir was read from Joseph Woods, Esq., on the various forms of Salicornia, accompanied with additional notes by Mr. Richard Kippist, curator of the Society. The author commented on the varieties and sub-varieties of the species of the genus Salicornia, more especially the British species, S. herbacea. He proposed to make a new species, S. lignosa; and was disposed to regard the variety of herbacea, S. procumbens, as a distinct species. He questioned whether S. radicans was specifically distinct from S. herbacea. A species found in the South of France, with tubercled seeds, he proposed to call S. megastachya. This plant was the type of Moquin Tandon's genus Arthrocnemum. The seeds of the true Salicorniæ, according to Mr. Kippist, are covered with curved simple hairs, whilst the embryo is conduplicate and incumbent, and the seed exalbuminous. In Arthrocnemum, the testa of the seed is crustaceous: the embryo is only slightly curved, and lies in the midst of albumen. The paper was illustrated with drawings of the seeds, and dried specimens of the various species, with their seeds.—The Earl of Derby presented to the Society a series of drawings of the living animals at Knowsley Park, by Mr. Waterhouse Hawkins. These drawings were beautifully executed, and consisted principally of species of Ruminantia and Solidungulate Pachyderms. We were sorry to observe that the binder had carelessly injured several of the plates, and cut off the names. J. W. Bryans, Esq., was elected a Fellow of the Society.

BOTANICAL OF EDINBURGH, *Jan.* 9.—The President in the chair. The following papers were read:—1. Botanical Notes of a visit to Schleswig-Holstein, in August, 1850, by Mr. W. L. Lindsay. 2. On the Chemical Composition of Cytisus Laburnum, Euphorbia officinarum, Lunaria biennis, and Bryum ligulatum. By Mr. R. Smith. 3. Biographical Notice of the Rev. Dr. Rottler. By Dr. Cleghorn. The author had looked in vain for any memoir of the venerable Rottler, Danish missionary at Tranquebar, who formed one of the little knot of early botanists who searched the plains of Southern India, leaving comparatively little on the eastern coast for subsequent discovery, and he considered it a duty to draw attention to some MSS. which had fallen into his possession, giving fuller particulars than had yet appeared of this amiable and illustrious man. He stated that Dr. Rottler had been engaged by the English Government, in 1796, to make a tour in Ceylon, his acquaintance with the native language and his knowledge of botany enabling him to collect much valuable information after the island was captured from the Dutch. This venerable man, after attaining the age of 87 years, which few reach in India, died at Madras, in 1836, having devoted upwards of 60 years of his life to mission work. Dr. Cleghorn exhibited a drawing of the Rottleria tinctoria, named by Roxburgh in honour of his friend Rottler.—Mr. M'Nab exhibited specimens from the Botanic Garden, of Colquhounia vestita, which had been raised from seeds received in January, 1850, from Dr. Jameson, Saharunpore, also specimens of Stylosanthes cærulea, a leguminous plant from Venezuela, raised from seeds communicated by Mr. Buist, nurseryman in Philadelphia. He likewise exhibited leaves of a peculiar variety of Ivy, sent to him by Mr. Machray, from Doneraile, near Cork, and which it was proposed to name the Doneraile Ivy. Dr. Balfour exhibited a specimen of peat from Cantyre, received from the Duke of Argyll, which was composed of leaves of trees and shrubs in a good state of preservation. As the examination of the peat was not completed, Dr. B. deferred a notice of the plants composing it, until next meeting. Six gentlemen were elected fellows.

## Miscellaneous.

*The Scarlet Geranium at Sea.*—In the year 1825 I sailed for America in a ship conveying emigrants to Canada, all of them humble people from a rural district, to whom the inside of a ship or the waves of the sea were as strange objects as a sight of the man in the moon would have been, or a slice of the green cheese of which, according to nursery traditions, it is composed. Fine hearty sturdy country people they were, as rich in children as they were poor in pocket. Most of them had connexions in the land they were going to; but beyond a belief that there were no taxes in America, and consequently there could be no want, their ideas on the subject were vague enough. It was an amusing sight to an unreflecting young fellow, as I then was, to see their bits of furniture brought on board, the old carved chests containing their wardrobes, their various cooking utensils, and the little things with which they could not part, because "they had had them so long." Amongst these were various birds, a cat or two, and a dog; one little girl had a field-mouse in a cage; and a nice matronly woman had a Scarlet Geranium. Now my mother had been fond of Geraniums, and she had often permitted me when a child to water them as they stood near a spot where she was engaged with her household duties; so that it was like an old acquaintance, this said Geranium, in its green-painted tub. Its owner had been repeatedly told "it would die" on the voyage. "Never mind, then; let it die, so long as it dies with me," was her reply, as she fastened it up in a corner of the rude deck on which these poor emigrants were to live for seven long weeks. And so, with a strong breeze and a flowing sheet, we left the harbour together. The fair wind with which we sailed soon shifted into an adverse quarter, and off the coast of Scotland (for we were going north about), it became a dead *roser*, with all the usual amount of miseries. To a set of poor country folk, what can exceed the miseries of the temporary lower deck of a collier converted into an emigrant ship, hatches battened down to keep out the washing seas or heavy rain, foul air, sea-sickness? Miseries indeed! The word as understood when applied to felons in gaol, or paupers in a workhouse ashore, conveys no conception of the wretchedness in question It was soon found of no use to contend with the violence of the elements; so, when things were at the worst, the captain ordered the helm to be put up, and we made a fair wind of it by running to the south. As soon as the ship was fairly before the wind, the hatches were unbattened, light and air were admitted, and attempt was made to get things snug. As a sailor-boy, part of this pleasing duty fell to my lot; and well do I remember the thoughts of my comfortable home which were awakened when, amidst the desperate confusion of that lower deck, the old Geranium caught my eye. It had flowers on when it came on board; they had soon fallen off; day by day it sickened and languished; the colour went little by little out of its leaves; and then they dropped off altogether, and were succeeded by smaller and feebler ones, till at last all appearance of life had entirely vanished. Still it was kept. It had flourished for years in the cottage-window of its owners, which looked out upon pleasant green fields. That cottage and those fields, now tenanted and tilled by others, still lived in their recollection, and were associated, no doubt, with the plant in question. And so it went with us; crossed the wild dark ocean, accompanied us up St. Lawrence, and there we parted, for it went ashore with its owners. Yet I saw it once again; for being on shore upon some duty, I went upon Goudie's Wharf, where I found a family group sitting upon their effects preparatory to embarkation up the river in a steam-boat. They were part of our emigrant passengers. And standing by the side of their bedding and boxes was my old acquaintance, the Scarlet Geranium—dead, dead, looking as hopeless and miserable as the unhappy exiles themselves. But if, as I have little doubt, they have long ere this made for themselves a happy and independent home in the western solitudes, it may be hoped that with the Scarlet Geranium they did not lose the last link which bound their affections to their fatherland. *The Florist, Fruitist, and Garden Miscellany, for Jan.* 1851.

*Ripe Raspberries in January.*—J. Matthews, Esq., of Frogmore, near Kingsbridge, has a quantity of Raspberries in his garden; a proof of the extraordinary mildness of the season.—*Plymouth Herald.*

*The Ma-an-ga Rose.*—Knowing the interest you feel in the science of Horticulture, I have taken the liberty of inclosing a specimen of wild double Multiflora Rose that grows in this country. It was discovered by a young Wyandotte girl, whose perception of the beautiful is a source of admiration to me. As I had never seen a double wild Rose, and not recollecting that any were described in the books, I thought it might prove a valuable contribution to the flora of our country, and therefore determined to forward this specimen to you, and, if a new variety, through your present to the Horticultural Society of Cincinnati, a Rose bush in the spring, when it can be transplanted without hazard. I so much doubted its growing wild that its graceful discoverer piloted me through the prairie to the spot three days ago. There, on the point of a ridge, in a space not more than 20 feet square, they were climbing over under growth, making the wilderness indeed blossom like the Rose; but to me its situation was most curious, from the fact of its being surrounded, on the declivity of the elevation, by a wilderness of the single wild Rose and Pea Vines. A lively imagination might fancy the ridge to be the burial place of some of the aborigines, thus decorated by pious hands long since mouldered into dust. Should this prove a new variety, I would be glad that it should perpetuate the name of its graceful discoverer, *Teche Nehame Ma-an-ga*, which the United States interpreter tells me may be rendered into English, *The Rose of Wyandotte.* Me-an-ga is an epithet of endearment, meaning bright looking. I called at her mother's cottage, and found their garden filled with beautiful wild flowers and flowering shrubs, collected by the daughter. One shrub with its long spikes of pale yellow flowers and graceful, fairy, locust like leaves was very pretty, but her hedge of wild Roses excited most intense admiration. There is a cluster now lying before me, on which there are twenty full blown Roses and eight buds; they have been in bloom since June 15. *Cincinnati Horticultural Review.*

*Sea-side Plants.*—There are some plants which will endure a prodigious amount of blowing without material damage. And of these the Sycamore, and other Maples, the Elms (especially the Wych Elm, the Cornish Elm being rather liable to be broken), Birches, if planted young; Beech, when likewise planted in a small state; the common Alder, the mountain Ash, and several Services; and the Scotch Fir, Austrian Pine, Pinus laricio, montana, and pinaster, if a little sheltered, will make excellent trees for the sea-side. Poplars and Willows will be valuable for temporary shelter, as they will grow rapidly and tall, and thus protect the others till they become strong; after which they should, by degrees, be almost entirely weeded out. Among dwarf sea-side plants, the Dogwoods, the Ribes sanguineum and aureum and grossulariæfolium, the deciduous Viburnums, the Symphorias, the Elders, the Tamarisk, some of the Spiræas, particularly Salicifolia, the common fly Honeysuckle, and the Berberries are particularly hardy for deciduous shrubs; while all the

Hollies are invaluable as evergreens, and the common Rhododendrons, Heaths, Brooms, (when planted young), evergreen Oaks if once established, evergreen Berberries, double and single-flowered Furze, Phillyrea latifolia, Araucaria imbricata, common and Irish Yew, and Arbutus and Laurustinus if very slightly sheltered, will, with Privet, which is almost evergreen, be useful in rendering a marine villa garden green and lively during winter. Of these, the Tamarisk, the Elder, and the common Furze, will flourish on the very margin of the sea, and in the poorest sand-banks. *Kemp, on Small Gardens.*

## Calendar of Operations.

*(For the ensuing week.)*

GENERAL REMARKS.

The extraordinary mildness of the weather makes us more than usually solicitous regarding the fate of early blossoming fruit trees, many of which are already showing that they stand in need of a check. Should we have a continuance of this weather for another fortnight, nothing but downright perseverance and energy on the part of the amateur and gardener, will save their standard Marie Louise and other early kinds of Pears. It behoves us, then, to be on the alert in preparing coverings of cheap canvass or netting; or, if these cannot be obtained, such other protective measures must be used as best suit our circumstances. For the protection of our walls and trellises, we are providing a quantity of stout Scotch sheeting, 32 inches wide, at 3½ per yard; and with this, and a simple but effective arrangement of lines and pullies, we hope to counteract (as we did last year,) the ill effects of the cold, cutting winds of March, and the 16° of frost in April. Everything is now in the most tender state possible, and even the common garden vegetables are sprouting, as though it were May. As a means of protecting these from cold easterly winds, which are even more to be dreaded than severe frost, we are ranging evergreen branches among the rows of Spinach, Broccoli, and Parsley, at intervals of a few feet. Choice Roses are also in great danger, and should be well sheltered.

PLANT DEPARTMENT.

LET the Pelargoniums, intended for the early bloom in April, have sufficient space, and a free circulation of air, to prevent their being drawn. If kept too warm, they will become what is termed blind. Give sufficient water to keep the plants in a constantly progressing state; but avoid over-watering, which will cause the leaves to "spot." Plants, intended for flowering in the early part of June, should be shifted for the last time if necessary. Slight syringings on fine clear days will be beneficial to Pelargoniums, if the weather is not too cold to allow of the admission of air, until the damp has evaporated from the plants and the floor of the house. Heaths, and hard-wooded plants, generally, must have air whenever the atmosphere out of doors is above 40°, and the wind not too cutting; avoiding all due excitement of the plants until the season is more advanced. Bring on successions of bulbs to furnish the drawing-room and conservatory; and while there, supply them liberally with water, in order to prolong their flowering season. Primulas of sorts, Tree Violets, Mignonette, and Leschenaultias, will now be useful, and should receive their full share of attention. Let all such plants as Camellias, Daphne indica, and Azaleas, that have done flowering, be placed in a cool house where frost is excluded, until they show an inclination to grow, when they can be repotted and put at once into a warm Vinery or Peach-house to make heir growth.

FORCING DEPARTMENT.

VINERIES.—If the Vines have any of their roots in the open border, it should be covered with fermenting litter, to afford a slight heat to them. If the fermenting material rises to about 75° or 80°, it will generally be found that the soil beneath will range from 60° to 65°; this may be occasionally ascertained by inserting a thermometer into the soil, so that any injury to the roots, either by excess, or want of warmth, may be prevented. A little ingenuity is necessary to make young rods break regularly at this season; this may be managed by bending them down to the bottom of the rafter, and curving them in such a manner as to elevate the buds nearest the base, above their more precocious brethren, which, in their turn, must be induced to break regularly by the same method. Until the buds are broken, let the amount of heat and moisture be carefully regulated, not allowing the temperature to exceed 55° by night, nor 65° by day, unless with sun-heat. Great care will now be necessary to prevent weak and slender shoots, as an undue amount of artificial heat, for a few days at this season, will do irreparable injury in this respect. Rub off all buds which do not show fruit as soon as they are distinguishable, except when they are required for the formation of wood. If useless shoots are allowed to remain, they exhaust the stored up energies of the plants, which ought to be devoted to better purposes, and by the time they are able to elaborate sap, either for themselves or their neighbours, they must be cut out of the way. It should be remembered that only a certain breadth of foliage can be exposed to the direct influence of the sun's rays, and the whole of this should consist of the leaves belonging to the present and future fruit bearing spurs. It is no less a disadvantage to retain too many of those which do show fruit; if the Vines happen to be in first-rate condition, probably every bud will show a bunch or two, but to allow them all to remain would cause disappointment in this year's crop, and materially injure next year's also. As soon as the most promising shows can be distinguished, they should be reduced to a number consistent with the present power and future strength of the Vines, and in no case should more than one bunch be left on a spur.

FLOWER GARDEN AND SHRUBBERIES.

In situations where the Pentstemons and Antirrhinums require protection in cold frames, the stock of plants should now be carefully examined, to see that they are going on well. If the old plants of Pentstemons have been taken up to preserve through the winter, as recommended last October, they will be found now to be rooting freely, and should have plenty of ventilation whenever the air is free from frost. Propagating half-hardy plants for masses should now be proceeded with, in order that they may be well established before turning-out time arrives. Any kinds, of which you do not at present possess a sufficient quantity, should be put into a warm, moist temperature to induce them to make young shoots. These will strike freely in a similar situation, and after having produced several crops of cuttings, they may be gradually hardened off. Cuttings of scarlet Geraniums, Calceolarias, Petunias, Verbenas, and a host of other things struck now, and encouraged by careful management, as regards potting and a genial temperature, will not be much behind autumn struck plants; and, in many places, a fine summer display is made during winter, only a sufficient quantity of plants are kept to supply cuttings in February and March.

FLORISTS' FLOWERS.

Should severe weather set in, it will be absolutely necessary to hoop over Tulip beds, and afford the rising foliage some protection, as at this time or season of their growth, they are susceptible of severe injury, and if they get a check it is hardly gotten over during the season; a light net is, perhaps, the best thing for this purpose. RANUNCULUSES.—Look over the stock and make the final preparation for planting. Here we would give a word of advice to young beginners; roots that have not previously flowered are most likely to bloom finely, and should therefore be planted on the best bed. Those that were weakened last season by the flowers should be planted on a side bed for increase, and will make excellent succession stock for the next year. This plan will insure, under good treatment, a regular and even bloom. Seedlings should be put in directly; though the roots may be small, still they will often grow most luxuriantly, and therefore should have sufficient room, at least 4 inches root from root. Let Dahlias have a genial heat, with sufficient ventilation; as for the method of propagation we will give that in a week or two.

HARDY FRUIT GARDEN.

FILBERT BUSHES.—As soon as the female flowers can be distinguished, the bushes should be systematically pruned. All the shoots which do not show fruit should be shortened, regulating their length according to their strength, and spurring the weak ones in close to the old wood; it will be necessary to remove some of the shoots, to prevent over-crowding. After regulating the head, clear away the nest of suckers with which these bushes are too frequently encumbered. If the bushes appear weak they should be assisted during the growing season, or, if too strong, root pruned. There is no reason why a collection of Nut bushes may not be as fruitful and ornamental as a collection of dwarf Apples or of pyramidal Pear trees. In pruning, a little precaution is necessary not to remove the whole of the male catkins, until some days after all the female flowers are expanded; and as many of the bushes will, in all probability, be destitute of male flowers, it will be necessary to procure some well-furnished branches from other bushes, and shake them gently over those which have female flowers only.

KITCHEN GARDEN.

At this season we give a slight sprinkling of salt to all ground which has been trenched several weeks, as soon as it will bear treading upon; and after the salt has been applied we fork over the surface. The improvement in the crops by this means is very visible, and thousands of insects are destroyed by it. It is scarcely necessary to add, that a dressing of 2 lbs. to the superficial yard is of the greatest benefit to the Asparagus beds, and the dressing may be repeated in the beginning of April. The crops of Seakale will be equally benefited by the application of salt. Besides the increased vigour and health of these sea-side plants, when salt has been freely used, it possesses the additional good qualities of destroying insects and ordinary weeds, and thus economising labour in the regular keeping of the place. An early crop of round Spinach should be sown this week on a warm border. FRAME POTATOES.—For this purpose make up a bed of Oak or Beech leaves, sufficient to produce a gentle bottom heat. The potatoes should be started in boxes of leaf-mould, and planted as soon as they have produced shoots an inch long; by taking this precaution all gaps are prevented. They should be planted 9 inches apart and 6 inches deep, with 3 inches of soil between the sets and the bed of leaves. By planting them this depth at once, the trouble of earthing up is avoided, and an excellent opportunity is afforded of getting a crop of Radishes, which will be ready to draw before they are in the way of the Potatoes. It will be necessary, for the sake of both Radishes and Potatoes, to admit air freely, and to draw off the sashes entirely during mild weather. As soon as the ground will admit of it, preparations should be made for planting new beds of Horse-radish and Jerusalem Artichokes. For the former, the ground should be rich and finely broken in trenching, that the new underground stems may be formed clean and straight; and as the last-named vegetable seldom comes to maturity in this climate, a very favourable situation should be chosen, that it may have the best possible chance of forming its tubers, although it cannot perfect its flowers. The soil used should be a light sandy loam, as a rich soil makes them grow too rank, and puts off the formation of tubers to too late a period.

State of the Weather near London, for the week ending Jan. 23, 1851, as observed at the Horticultural Garden, Chiswick.

Jan. 17—Fine; with sun; heavy rain at night.
— 18—Clear; very fine; clear; slight frost.
— 19—Fine; cloudy and fine; overcast.
— 20—Densely and uniformly overcast; boisterous, with heavy rain at night.
— 21—Overcast; very fine; heavy rain in the evening.
— 22—Clear; exceedingly fine: clear.
— 23—Frosty; fine; clear and frosty at night.
Mean temperature of the week 2 deg. above the average.

State of the Weather at Chiswick during the last 25 years, for the ensuing week, ending Feb. 1, 1851.

| Jan. and Feb. | Average Highest Temp. | Average Lowest Temp. | Mean Temp. | No. of Years in which it Rained. | Greatest Quantity of Rain. | Prevailing Winds. | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | N. | N.E. | E. | S.E. | S. | S.W. | W. | N.W. |

The highest temperature during the above period occurred on the 28th, 1843 and 1846—therm. 56 deg.; and the lowest on the 27th, 1827—therm. 17 deg.

## Notices to Correspondents.

AMERICAN BLIGHT: *S F and W D.* Wash the branches with spirits of tar, applied with a painter's brush. ‡

BORDER EDGING: *Tay.* You must be mistaken. Saxifraga tridactylites is a little annual wholly unfit for this purpose.

COALS: *K L.* It is not probable that coals are really at all improved by exposure to the open air; some of the inferior sorts appear to be injured by it, as the pyrites they contain begin to decompose, and hence the coal crumbles. Whether the object of exposure be to moisten the coals, or to dry them, the same end may be quite as well attained under cover. *E.*

CREEPERS: *Inquirer.* You will gain little by employing very large plants, unless you have excellent means and a good deal of skill for removing them. The foundation should be American creepers, Ivy, Evergreen Roses, Hops, Vines, and the Trumpet flower (Bignonia radicans), pushed on with plenty of dung.

DIRTY PLANTS: *Sub.* The smut Fungus can only be removed well by means of a sponge, soap, and warm water. The scale may be destroyed by water of the temperature of 150° or 160°; but all soft tops and unripened wood should be removed previously to its application. ‡

FANCY GERANIUMS: *Mrs. M.* Next week.*

FERNS: *K L.* The names are all right, with the exception of No. 1, which we presume should be pendulinum; No. 2 will be found under Aspidium. The new generic names are proposed by Mr. Smith, in Hooker's "Journal of Botany."

FINGERED CITRON: *A Devonian.* We are making inquiries after it.

GUANO: *W B J.* There is surely some mistake: we will inquire.

INDIAN ORCHIDS: *T J, Madras.* Pray do not send anything to us; we cannot undertake the business of agents. You had better correspond directly with Messrs. Stevens, to whom we shall hand the case on arrival. The speculation would be extremely doubtful as to profit.

NAMES OF PLANTS: *B M.* It is impossible to say what your plant may be; possibly it is Brunsvigia ciliaris. Plants cannot be named from slight unscientific descriptions. — *Erzeroum,* 250, Euphrasia tatarica; 220, Rhinanthus major.—*R G F.* Nicandra physaloides, called in the seed shops Aikekengi.—*A Devonian.* It is rightly named. A drawing is made for "Paxton's Flower-Garden;" and we should be glad of any further information you can give; especially it would be desirable to see the flower-spikes while enveloped in the sheath which they finally cast off. It is quite uncertain whether the aquatics you name would live; but it is worth the experiment. Any species of Villarsia, or Nuphar, would certainly grow; and probably also Caladium esculentum and Papyrus, with Richardia africana (*alias* Calla æthiopica). — *Young Gardener.* 1, common double red Hepatica; 2, Holly-leaved Berberry.—*Enquirer.* The Bread-fruit from Algoa Bay is a Zamia of some kind. The solid trunk is the Bread-*fruit.*—*T P H.* The piece of root that has been dug out of an old bank appears to belong to the Bryony. If so it is poisonous. —*A S.* Lycopodium stoloniferum, Radd. *S.*—*T C D.* Lycopodium involvens. It is dead, and cannot be propagated. Its motions are merely hygrometrical.

PEAS: *Inquirer.* No Pea is equal to Knight's Tall Marrow, in sugary quality. You may grow it for a main summer crop, and also for a late; but it requires strong and tall sticks and plenty of room. If you cannot command these, choose Knight's dwarf Marrow, or Woodford's Green Marrow. ‖

PROTECTING FRUIT TREES: *Inquirer.* No particular time can be stated, either for putting up or taking down, whatever protecting materials may be employed. That depends on season. Generally speaking, protection should be ensured some time before the blossoms expand; partially reduced when the fruit is set; and entirely removed as soon as injury from frost is no longer to be apprehended. ‖

SEED LISTS: *Scotus.* Apply to Drummonds, of Stirling, and Dawson-street, Dublin, for their seed list, which is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon, for the sake of both sellers and buyers.

STANDARD ROSES: *H T.* The green dust does no harm; it is caused by the mild damp season, and is possibly connected with some debility in the stock. We should let it alone.

STOCKHOLM TAR *v.* HARES AND RABBITS: *Correspondent.* A small ring of Stockholm tar drawn round the lower part of the stems of young Larches would not hurt them; but we should not like to use more.

TUBEROUS NASTURTIUM: *W. Clowes.* Unless you can manage to eat the tuners we know of no use to which they can be put. In this country men will hardly prefer them to even Jerusalem Artichokes.

MISC: *Old Sub.* Your Camellia appears to have got into ill-health; but in the absence of more information about its treatment than your letter furnishes, we are unable to say how that has happened. The Euphorbia looks as if it wanted more heat, and as if it would be benefited by an occasional dose of *weak* liquid manure. ‡

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

DO YOU BRUISE YOUR OATS?
No; then you lose 50 per cent.

A NICE STABLE MESS, effecting immense saving, and vastly improving the condition of the animal—bruised Oats, straw cut into chaff of a certain length, and a little hay; the whole steamed, and served up at discretion. No rack—down with the racks;—MARY WEDLAKE'S MACHINES, 118, Fenchurch-street, and 11, Tavistock-street, Covent-garden, where a machine may be seen at work. A pamphlet on the above, by sending 12 postage stamps.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

**The Agricultural Gazette.**

*SATURDAY, JANUARY* 25, 1851.

MEETING FOR THE FOLLOWING WEEK.

THURSDAY, Jan. 30—Agricultural Imp. Soc. of Ireland.

IN theory, as Dr. ANDERSON justly observes, a manure to be perfect ought to contain all the elements of the food of plants in the exact proportion in which they are required; but however true that may be in theory, it cannot be complied with in practice—and hence the need of the supplementary practice, for so it is, of the rotation of crops; and hence, again, the propriety of conjoining our theories of manuring and cropping, and of arranging in our experiments that both of these considerations shall have due attention.

The maintaining of the soil in the highest degree of fertility, by a proper system of manuring and cropping, and the gradual exhaustion of that fertility by careless or mistaken practice, have always been topics of the deepest interest. Almost every province bears witness to the fact of lands having become "tired" of growing Wheat, Turnips, Clover, or some other specific crop generally cultivated.

Prior to the introduction of artificial manures, complaints of this kind were more loud than they are at present, but even where artificial manures are now liberally applied, it is difficult to say what judgment another period of 30 years may pronounce as to the general fertility or exhaustion of the soil. And it is with the view of arriving at some definite conclusions on this subject, that we would recommend some more general system of reporting experiments with specific manures under different modes of cropping and management than has hitherto prevailed. It cannot as yet be said that a series of experiments has ever been conducted on a scale sufficient to establish any trustworthy guide to the manuring and cropping of land, so as to maintain it in the highest degree of fertility. Reports on experiments have generally been confined to individual crops. They have seldom extended over the whole rotation, though even that would be insufficient to establish a perfect system of manuring. An experiment with any specific manure, whether artificial or not, for one crop, only furnishes evidence as to that crop, and not for the others in the rotation; and one rotation speaks only for itself.

But reported experiments with specific manures have been not only confined, generally speaking, to one crop, but have been conducted apparently just to ascertain which of two manures applied to the soil will produce the greatest produce. Thus, a soil tired of growing Turnips, which at one period in its history (extending over three rotations with an application of 20 tons of farm-yard manure to each), would have given a return fluctuating between 25 and 30 tons of Turnips per acre, now, notwithstanding equal, and it may be superior management as regards draining and supply of manure, only yields from 15 to 20 tons, showing a defalcation of 10 tons per acre. But 4 cwt. of alkaline phosphates and organic matter are now applied per acre, instead of 20 tons of farm-yard manure, and we again realise the original productiveness of the land, in the case of the Turnip crop.

This experiment might lead one to conclude that the land has been restored to its original fertility, but any such conclusion is premature—the facts adduced prove nothing of the kind. All that they amount to is, that 4 cwt. of artificial manure, containing about ¼ cwt. of organic, and 3 cwt. of inorganic matter, with ½ cwt. of water, were applied to the soil, and that 3½ tons of organic and 5½ cwt. inorganic matter, with 31 tons 4½ cwt. of water were removed. Beyond this all is speculation without further experiment. And we put this case just to show the meagre character of experiments, as they are frequently reported. We are at liberty to say that these quantities of organic and inorganic matter have been applied and removed from the soil, but we have no right to say that after this has been done the soil consequently is exhausted of the difference, much less that the application of such a manure, along with the application of the farm-yard manure, to the corn and Grass crops will keep up the fertility of the soil to its highest degree. Of itself the experiment is useful as showing how the application of such a small quantity of artificial manure enables the soil to work up and manufacture such an increase of valuable produce. It introduces a new system, conferring many benefits upon the farmer. The increase of the Turnip crop is not the only advantage gained by him; for he can now apply the farm-yard manure arising from one crop to the lands for the ensuing corn crop, in cases where Barley, Oats, and spring Wheat are grown, instead of to the one succeeding it, as under the old system. There is in such cases a saving of manure—a saving of capital—and an increase in both corn and Turnip crops; so that, putting all advantages together, the general gain to the farmer is considerable. But although all this may be true for the time, yet the gains thus derived, so far as they are immediately connected with the experiment, are only of a temporary character, having no certain duration. Granting that, from the other advantages arising out of the system of growing Turnips with artificial manures, the soil is for the time restored to its original state of fertility, there is nothing arising out of the experiment to warrant the conclusion that a continuance of the application of the artificial manure will maintain it in this state, but rather the reverse; for, if the soil became tired of growing Turnips, and other crops generally cultivated, with the application of farm-yard manure, the inference is obvious that a manure still more defective of supplying all the elements of the crops will be at least as unable to maintain its fertility. The annual progress of exhaustion may be slow, and amid the fluctuations in the weight of crops, almost imperceptible. It was so under the old system. Few calculated as to amount; and yet at the expiry of 30 years, a decrease of 10 tons of produce had taken place per acre on one crop.

The individual experiment before us furnishes indeed but little useful evidence of any kind. The general fertility of the soil is a thing on which a thousand influences are at work; and a system of experiments upon the whole subject, involving the succession of crops, as well as the wants of particular crops, is needed. It is not experiments to test the comparative values of different manures alone, but of these as acting under and upon different systems of cropping, that are wanted; for before it can be ascertained that any equilibrium is kept up in the supply and consumption of manure, ou experimenters must extend their operations. Report must embrace both these subjects, in order to furnish the vast amount of material now needed by chemists, as well as farmers, to furnish sound theory, and guide good practice.

Many of our readers may probably think that experimenting will not "pay;" but as all applications of manure and cropping are experiments of the class which we principally suggest, difficulties of this kind disappear the moment we begin to handle the subject practically. All that is wanted, generally speaking, is REPORTS of experience and observation.

## SCOTCH AND ENGLISH FARMING.

THE animosity which existed in former times between the Scotch and English nations, occasioned many a hard-fought battle, which the historian has chronicled and handed down to us. The natural and happy union of the two countries has put an end to their mutual strife. The two, firmly banded together, now join hand in hand in repelling the common foe—they have, in regard to each other, turned their swords into ploughshares, and have long since buried all intentions of actual hostility. Some little remnant of the old leaven does, however, now and then appear, when the English and Scotch come into competition in the peaceful pursuits of their common industry—whether of manufactures, commerce, or agriculture. It is to a very amusing instance of the working of this old heartburning that we now wish to call attention. A Scotch farmer having made an excursion through the English counties, happened to publish some remarks, and in qualifying his praise of the agriculture of the natives, spoke rather disparagingly of their skill in some points. In retaliation Mr. Pusey invades East Lothian; "drives his own horses 20 or 30 miles a day; uses his eyes whilst sitting on the dickey;" returns home fully charged with electric ire, and watches an opportunity of firing off his thunder and lightning against the whole tribe of Scotch farmers. Truly his recent exhibition at the London Farmers' Club must have been a source of regret (or amusement) to all his friends in England or even in Scotland, where, notwithstanding this display, we can assure him he has many. Indeed, we can scarcely believe it is the same gentlemanly Mr. Pusey who writes in the "English Agricultural Journal"—the manner in which he has acquitted himself in this last instance is so different from his usual bearing. He tells his English friends that he once believed in the superiority of the Scotch farmers over the English, but knew more about it now, for in his recent tour he made the discovery that the low-land was "well farmed" (ah! does Mr. Pusey admit so much as this?)—the hill sides "very moderate," but "on the top of the hills no farming at all;" had the contrary been the case it would have been *high* farming with a vengeance. However, Mr. Pusey wished to be impartial, and did not want his hearers "to take his own opinion," being but a recent convert and unduly fired with zeal. Dr. Johnson, purblind, and in his dotage, is raised up to testify as to the fertility of the land. Oliver Cromwell, his next agricultural authority, goes another hundred years back to bear him out as to the richness of the soil. Since these times Mr. Pusey does not note any improvement in the agriculture of the country, but the morals of the people he admits are improved, for "the most impudent lying, and frequent swearing," which the people were formerly noted for, have been given up, or at least have been modified into a vile habit of "bragging, boasting, and humbugging the simple and credulous English." Such are the heads of Mr. Pusey's after-dinner speech. Let us say a few words in passing, on the general question. We have always been of opinion that the Scotch and English systems of farming never admitted of comparison as a whole, and have not failed before now to express our dissent from those who made sweeping and unqualified statements on this subject—there has certainly been by far too much of it from the north side of the Tweed. In fact, the greater number of the recent pamphlets which have issued from the Scotch press have generally harmonised with each other in this respect. Mr. Caird's "high farming" experience was particularly addressed to the farmers in the south. Lord Kinnaird's boasting on this head was most notorious, and his racy antagonist "Peter Plough," coincided with him. Mr. Munro on "Landlords' Rents and Tenants' Profits" saw nothing but ruin for the Scotch farmers, but admitted that the "Farming of the Lothians" would be a sufficient protection to the farmers in the south of England, and "Blackwood" styled this "a very able pamphlet," and joined in the general chorus. Although Mr. Milne, in his "Report" is rather dubious about this matter, he has given the northerns the credit of "making more of their land." Mr. Pusey might have attacked either or all of these authorities with good grace, had he not been indirectly implicated himself in encouraging all this nonsense, as we shall give him something more than a hint of, by-and-bye. In truth we should have been right glad to have seen him attack that Scotch "Preux Chevalier"—Lord Kinnaird; and the Docks amongst the Wheat in the Carse of Gowrie, to which Mr. Pusey refers, furnished him with a legitimate *casus belli*. A very pretty quarrel these two might have made of it, and one with which we should have been the last to interfere. Having, however, made up his mind for a passage of arms, Mr. Pusey has not thought it necessary to discriminate. But, like Don Quixote of old, he sallies forth, and, very *mal-apropos*, couches his lance and

makes a furious onset on an "East Lothian Farmer," who actually did great justice to English farming, who wrote "the farmers of Norfolk and Suffolk are equal, if not superior, to any class of farmers in Scotland, and they are entitled to hold the first place in agriculture." *He* therefore did not "laud the superiority of the Scotch over the English;" and, as to the difference in the number of years' purchase, Mr. Pusey in part misrepresented the statement made, for the purpose of making out a case; he has completely missed his mark, but he has discharged his battery, and what a noise he has made! The main reason why the Scotch farmers think themselves superior to the English is the fact, that, taking the practice of the latter generally, they are deficient in those details in which the former excel, viz., in the economy of power. Arthur Young is a much better authority in this matter than Dr. Johnson or Oliver Cromwell. But the Scotch writers, on the other hand, are continually underrating their own advantages and overrating those of their neighbours, in which they are encouraged by a few English landlords. We cannot believe the "East Lothian Farmer" has given occasion to such a tornado of abuse, in consequence of the quotations which Mr. Pusey has given in his speech. Have the English waggons not been attacked? Mr. Pusey is quite sensible of the "defects" of English farming, but he wishes to reserve to himself and friends (such as Mr. Mechi, who is specially licensed) the privilege of admonition or correction—a Scotchman must not have the impudence to recommend "the exchange of waggons for carts." Mr. Pusey, in this matter, reminds us of the sentiments addressed by our Scottish bard when inspiring his countrymen with a healthy hatred of the French:

"The kettle o' the kirk and state
Perhaps a clout may fail in't;
But deil a foreign tinkler loon
Shall ever ca' a nail in't."

In regard to the challenge which Mr. Pusey, a wealthy landlord, has given to the Lothian tenant farmers, not being interested, we have nothing to say, further than we think it would be a poor way of settling the question—a wager, at best, is but the fool's argument. The sensible speech of Mr. Torr, of Lincoln (which alone redeemed the London Farmers' Club from utter foolishness in this matter), was an admirable reproof to the previous speakers.

We must now conclude our observations with one word to Mr. Pusey, who it seems feels himself bound to act the part of knight errant, for the defence of the English farmers, their "character being in some degree in his hands." In the capacity of editor of the Agricultural Society's Journal we assail him on his chosen ground, we beg to tell him that the absurd articles which have appeared in that Journal on the science bearing so intimately and directly on the merits of Scotch and English farming, and which he has duly indorsed, shelter the whole of the disparaging writers which we have enumerated. If the Journal is right, Lord Kinnaird is also right. Mr. Pusey, in his recent review of the Progress of Agricultural Knowledge, should not have had respect to persons on this head, if he "were otherwise disposed to shrink from the task, the present state of English farmers rendered it doubly incumbent." Scotch practice is far in advance of English science. As to his "highest authority" in one department, we only wonder at his credulity, the stratum of errors, although covered by a mass of *debris*, yet crop out at his very feet. To our mind, Mr. Pusey has placed himself in a very ridiculous position; his unguarded speech can only be looked upon as the natural result of the false science which he has patronised.
*R. Russell, Kilwhiss, Fifeshire.*

## DRAINAGE UNDER THE ACT.

THE call for the observations of those "who have had a more favourable experience of the Act," may probably exclude the remarks of those who are disposed to state facts which have occurred during their experience whether "favourable or otherwise." Still I have ventured to trouble you with the following observations.

I think, with many of your correspondents, that the Act to authorise the advance of public money to promote improvements of land by works of drainage, is a good Act of Parliament, provided its provisions be economically carried out; but like most public enterprises it is liable to abuses, and not the least of which is the apparent desire to oblige the landowners to be extravagant, against their wishes, in carrying out some pet plan to which the inspector or others in office may have committed themselves, when the landowner knows from experience that such plan cannot answer physically or economically.

The field department is carried out by inspectors acting under orders from the office in London, who have, from what I have observed, a certain course of proceeding prescribed, and who appear to be enforcing the adoption on all soils, without exception, deep and wide interval draining, and are restricted to the use of pipes only. Landowners who borrow the money, and have to pay it back again, are not consulted as to how their lands ought to be drained; and their agents, who practically know much more about the qualities and capabilities of the soil of their estates than strangers can possibly know, are often treated as mere schoolboys. But I am digressing. It is experience that we require, for the practical experience developed by one little undertaking, well and properly executed, without all the fuss and humbug attempted to be cast around this subject, is worth all the theory that has been written on draining since the time of the flood.

In 1847 a gentleman applied to a company, who expressed a willingness to undertake the draining of his farm, and advance the money requisite, to be returned, with interest, by instalments; but before further steps could be taken, it was necessary to send their engineer to inspect the farm, and report on the mode of draining to be adopted, and the cost of execution. The inspection was made, and the estimate forwarded to the proprietor, which came to 6*l.* 5*s.* per acre. The landowner being very much surprised at the expense, and entertaining no hope of his tenant being able to pay the interest, decided on abandoning the idea of draining. Very soon after his tenant left, and the persons who looked at the farm, declined to take it, because the landowner, having only a lifehold interest in the land, could not promise that it should be drained. In this state of affairs, he asked my advice. I recommended him at once to apply to the Inclosure Commissioners, for part of the Government loan, which was promised; but he was informed that no part of it could be advanced, until some of the works were executed, and had been seen by an inspector under the commission, and that the cash would be advanced, in accordance with his certificate. Here was difficulty; the owner had not the means of either setting men to work, or of paying them. We soon arranged this matter, and I was desired to inspect the farm, to ascertain what portion really required draining, and to fix on the spot where to commence operations. The inspection was made, and a report forwarded to the proprietor, showing that his farm might be thoroughly drained for 425*l.*, which, on account of the smallness of the sum, as much surprised him as he had been astonished at the extravagance of the previous estimate, the difference being 625*l.*

Having obtained the promise of the loan, and authority to commence, we contracted with a drainer to execute the works, with the owner of a tile-yard to supply the pipes, and proceeded with the works until we had expended about 200*l.*, and then applied for an inspector. He visited the farm, made his report on our proceedings, and in due time an order for a sum, a little short of our expenditure, was remitted. The inspector visited us three times; twice during the progress of the works, and at the time of completion, for which something like 20*l.* was charged. He came from London by train, about 90 miles, in the morning, and returned in the evening of the same day. He went through his business in a quiet deliberate manner, and although much more theoretical than practical, gave little or no unnecessary trouble; neither did he exhibit the usual airs of an important man in office. He had too much good sense to insist on his notions being literally carried out, and was never heard, that I am aware of, to hint that if his propositions were not submitted to, and his directions scrupulously carried out, that a certificate would not be given, and of course the money expended would not be advanced. The money was advanced, including his own expenses, with the exception of a small sum which was disallowed, but it was never known why. The interest of the money, which from time to time had been paid to the workmen, until the advances could be obtained, was also disallowed. The total expenses amounted to a fraction under 427*l.*, and the cash received from Government 425*l.*, which shows that the undertaking was completed within 2*l.* of the estimate. The works have given the highest satisfaction to the landowner and tenant, and some of the land is as much improved as any we have ever seen, by draining. Although our progress in the works was as smooth as we could desire, yet we differed rather seriously on two points, and those we finally settled by bringing them to the test of experiment. The first bone of contention was relative to the best mode of draining a pasture field. Many years since this field had been ploughed, and when laid down to Grass, was left in high tortuous ridges rather more than 30 feet wide, the highest part of the ridges being 5 feet above the furrows. The soil is a clay loam, mixed with occasional streaks of sand, and very easy to drain. The land on the tops of the ridges, and about half way down the sides, was dry, and required no draining, the remaining portion being soft and spongy, and covered with aquatic Grasses and plants. We proposed to follow the furrows, and put the drains 2½ feet deep, at an expense of 50*s.* per acre, including pipes. This did not square with the views of the inspector, and he proposed, but did not insist, that the drains should be 2½ feet at the furrows, and should run perfectly straight down the field, from end to end, and cross the tops of at least two of the high ridges, where the drains would be 7½ feet deep. Drains thus made would pass one-third of the distance through soil which required no draining whatever, and be inefficient on part of the remainder, and would cost at least 5*l.* per acre. We declined to execute the works in the manner proposed, and drained it our own way, which answered the purpose perfectly. This was fully acknowledged on the visit of inspection which afterwards took place.

The other point of difference was on some very stiff tenacious clay land, which was scarcely worth cultivation, and had been neglected on account of its tenacity. We all agreed that this should be thoroughly, effectually, and permanently drained; but a question arose as to the plan to be adopted to secure this much-desired object. The inspector proposed 4 feet drains, 30 feet apart, which we objected to, having always been disappointed with wide interval draining in stiff clays. We prefer 20 feet apart, and 3 feet deep. It was finally arranged to have a portion executed on both the plans, to test the efficiency of each, and by way of still further testing the whim, which some entertain, that no stones should be put in on the top of the pipes, we selected about 4 acres of the most adhesive of the 10 acres on which to test the absurdity of a whim of our own. Three acres were executed precisely in accordance with the inspector's directions, 4 feet deep and 30 feet apart, the pipes nicely put in, and the clay and soil filled in, which had been thrown out of the drains. The three acres adjoining were drained 3 feet deep and 20 feet apart, the clay and soil being filled in as with the other three acres. The 10 acres only formed part of a field, the other portion being rock, which it was useless to drain, with a stonebrash soil, on which the farmer had gathered together a considerable quantity of small stones, which were laid in heaps on the land. We decided on using those stones in the drains by placing them 20 inches to 2 feet thick on the top of the pipes. The drains were cut 3½ to 4 feet deep, and 20 feet apart, and the pipes properly placed in the drains, and the small stones on the pipes, and the drains filled up rather above the surface with soil and clay, as in the other cases. When visited by the inspector, it was seen and admitted that the 4 acres were perfectly drained, the 3 acres in which the 3 feet drains had been placed, exhibited a a slight dampness in some of the furrows, and the 3 acres which had been done precisely as the inspector wished were scarcely benefited at all. He ordered additional 3 feet drains to be put in between those already there, thus draining the 3 acres 15 feet apart, which placed it on a par with the rest. More than 3 years have elapsed, and up to the present moment that part which had the stones placed on the top of the pipes proves decidedly to be the most effectually drained. This mode of draining is objected to by the commissioners and Mr. Girdwood; and the other inspectors either have the same objection, or urge it in obedience to instructions. I have adopted it, and found it answer admirably, and am not aware that any valid reason has been assigned for the objection which is made to the use of stones on the top of pipes.

We have also from practical experience extending over 25 years, proved that stone drains (the *till* drains of this district) are more substantial and permanent, and equally as good and effective as the pipe drains, and can only be set aside on the score of expense, which chiefly arises from the carting. If stone can be dug on the spot, or is thrown out of the drains in making them, in quantities sufficient to fill in the drains, they ought to be used, and will be more economical than pipes. I refrain from pursuing this part of the subject further, and consider our experience thus far in favour of the operation of the Act, but I cannot say so much for a similar undertaking which we are commencing. The inspector here is disposed to enforce his crotchets, on the faith of "four years' experience in all parts of England." By so doing he will inevitably nullify all the anticipated benefits to be derived from the draining, and in all probability entail a greater mischief on the owner, by saddling him with a higher interest than the increased value of the land will ever pay. I hope I may be disappointed, but if we are to take as a precedent, the estate pointed out by the inspector as an example worthy to be followed, I almost tremble for the safety of my employer, who cannot afford to be extravagant. He cannot expend 7*l.* or 8*l.* an acre on poor stiff clay soil, and hope the increased value to the tenant, by so doing, will enable him to pay the interest in increased rent. I know it will not. Some of the land in its present state is not worth more than 10*s.* an acre, and no one by draining alone can make it worth 20*s.* Then how is it to pay after being drained? It will require years of the best of cultivation before it will be worth 15*s.* per acre, thus yielding 5*s.* per acre only for interest, which is equivalent to an expenditure of 3*l.* 17*s.*; hence it is clear that on such land no more than 4*l.* an acre can be expended in draining with safety, and that whoever expends more will have to make up the interest from other resources. Can such draining answer—can it pay? Let speculators say what they may on this subject, economy must be insisted on by the landowner, or he will have bitterly to repent having borrowed the Government money, and particularly those who have only a life interest in the property on which it is expended. Why should not the landowner who has to pay interest and capital back again in 22 years, have a commanding voice in the matter, and be allowed to enforce a judicious expenditure of the money? And should not the judgment of a landowner on what really constitutes economy in his own district be preferred to that of an experienced stranger, who has no permanent interest at stake? A negative reply to this will place the landowner in a position which he does not deserve to occupy, and will infer that he is bigoted or ignorant, and incapable of judging for himself in a matter which is all but self-evident. Need I ask if this is the character due to the landowners of England? I cannot believe that they are so ignorant and short-sighted as to permit the uncurbed exercise of any arbitrary power in such a manner as to oblige a man to run the risk of ruin, under the pretence of being favoured with an immense benefit. It cannot be a benefit to any landowner to expend 7*l.* per acre of the Government money in draining. If any one is expecting this, the only advice we can give will be, to go into the following calculation.

A farm of 500 acres of poor clay soil having 7*l.* per acre expended on it, would be charged with 227*l.* 10*s.* per annum for 22 years; the same farm having 4*l.* per acre expended would be charged with 130*l.* a year for the same time, making a difference of 97*l.* 10*s.* per annum, and of 1500*l.* in the outlay. The 227*l.* 10*s.* will

not be obtained as additional rent, and some doubt may arise whether the 130*l.* can be realised, more likely 100*l.* only. Then it will be seen in this case, and it is not altogether hypothetical that at least 1500*l.* will have been expended, which is not warranted by the circumstances, and that at the end of 22 years the landowner will have sunk 2145*l.* on the farm, which he has no hope of seeing again—a pretty round sum to throw into the ditch, as the party would literally do who submitted to such wild extravagance; but then he will have the satisfaction of having paid for the best stereotyped theory of the day. I will conclude the subject by one more calculation, which may have its use. Take as an example a clergyman of a country village, with 2000*l.* spare cash at his banker's, and who, without the power to curtail his expenditure, is expending the rent derived from a glebe farm of 500 acres, which requires draining, and conceive him to have borrowed the Government money at 6½ per cent. with which to drain the land, and further that he is induced to do it extravagantly, at an expense of 7*l.* per acre, and that his tenant will agree to pay only the additional rent of 5*s.* per acre, it will be easily seen that in 22 years his 2000*l.* will have disappeared. Now, let us suppose that shortly afterwards he dies, the farm passes into other hands, and his children or representatives discover the sad and melancholy fact, that the 2000*l.* has been irrevocably lost. You may, perhaps, confer a service on some of your readers by inserting the following table, showing the interest to be paid for a certain cost per acre. The first column contains the expenditure on an acre, and the second the interest to be paid to Government at 6½ per cent.:

*6½ per Cent. Draining Table.*

## ON THE INFLUENCE OF DIFFERENT SALINE MATTERS ON THE SAINTFOIN.

By M. Isidore Pierre.

The action of any substance employed as a manure on a piece of primitive soil, should be considered as the *resultant* of the partial actions of this substance on each of the plants in the same soil. In order, therefore, to give an accurate account of the result of experiments made on this subject, it is necessary to be able to account for each of these partial effects, and this, in the present state of agriculture, is no easy matter.

An artificial meadow, in consequence of its simplicity in a botanical point of view, is much more fitted to such experiments; and for this reason we have chosen it for the special object of our study in the first instance.

We have, moreover, applied ourselves almost exclusively to that species of Saintfoin commonly called *large-seeded* or *double-crop* Saintfoin.

The saline matters employed in these experiments were: 1, carbonate of soda; 2, carbonate of potash; 3, sulphate of soda; 4, sulphate of potash; 5, sal ammoniac; 6, nitrate of potash; 7, nitrate of ammonia; 8, common salt; 9, burnt plaster; 10, burnt plaster, with salt, in different quantities; 11, crude plaster; 12, crude plaster, with salt, in various proportions.

These different substances produced different results on the different crops of Saintfoin, so much so, that if classed according to their efficacy, so far as it relates to the average of the whole of the four crops, or to any particular crop, they would not retain the same order.

This variation in order will be understood by a reference to the subjoined table, the matters enumerated in which are divisible into four great classes:

1. Those which produced an increase in the four successive crops of Saintfoin. 2. Those which produced an increase in one or more successive crops without producing a diminution in the remaining crops. 3. Those which acted favourably on one or more crops, and afterwards caused a diminution in the others. 4. Those which acted unfavourably on all four crops.

We were led to conclude, from our experiments, that certain costly substances, such as nitrates of potash and ammonia, might be advantageously employed; whilst others, such as salt and carbonate of soda, could only be used, in spite of their low price, at the expense of the Saintfoin, at least under the circumstances in which the experiments were tried.

It will be seen, too, that sal ammoniac, notwithstanding the heavy crop produced by it, cannot be recommended, in consequence of the great outlay necessary in the first instance, from its high price, which outlay is not afterwards covered by the returns obtained.

As to plaster, we prefer it crude rather than burnt, in equal doses. This preference we believe to be well founded, not only from our own experiments in the department of Calvados, but from those of other persons in the departments of Seine and Oise, and Seine and Marne.

Crude plaster, as is well known, only differs from that which is burnt by containing 10 or 11 per cent. more water; is consequently less rich in actual plaster than the latter. It would not be prudent at present to attempt to explain this superiority.

The proportions of substances which were chosen are no doubt arbitrary; what are the best proportions remain to be determined. Experiment, moreover, alone can show what influence soil and climate may have in these results, as also the comparative influence that all these substances may have on the subsequent crops obtained from an artificial meadow, submitted to their action for several successive years, and on the crops which may afterwards be reared thereon.

| Substances used. | Dose per hectare. | Order of Efficacy, after the 1st crop. | 2nd crop. | 3rd crop | 4th crop. | 4 crops. |
|---|---|---|---|---|---|---|
| | kilog. | | | | | |
| Crude plaster | 266¾ | 1 | 3 | 4 | 5 | 1 |
| Carbonate of potash | 33⅓ | 2 | 8 | 20— | 21— | 12 |
| Burnt plaster | 133⅓ | } 4 | 4 | 12 | 8 | 5 |
| Salt | 16⅔ | | | | | |
| Sulphate of soda | 133⅓ | 3 | 2 | 5 | 6 | 3 |
| Nitrate of potash | 33⅓ | 5 | 12 | 15 | 2 | 4 |
| Sulphate of soda | 66⅔ | 6 | 15 | 8 | 19— | 8 |
| Nitrate of ammonia | 16⅔ | 7 | 7 | 9 | 1 | 2 |
| Sulphate of potash | 33⅓ | 8 | 18 | 13 | 3 | 7 |
| Burnt plaster | 133⅓ | } 9 | 10 | 21— | 7 | 6 |
| Salt | 33⅓ | | | | | |
| Sal ammoniac | 66⅔ | 10 | 17 | 10 | 17— | 16 |
| Nitrate of potash | 16⅔ | 11 | 14 | 16 | 11 | 10 |
| Sulphate of potash | 16⅔ | 12 | 20 | 3 | 12— | 14 |
| Sea salt | 33⅓ | 13 | 16 | 14 | 4 | 9 |
| Nitrate of ammonia | 33⅓ | 14 | 11 | 6 | 10 | 11 |
| Burnt plaster | 266⅔ | 15 | 9 | 2 | 16— | 15 |
| Carbonate of soda | 133⅓ | 16 | 23— | 11 | 14— | 17 |
| Carbonate of potash | 66⅔ | 17 | 19 | 18— | 20— | 21— |
| Sea salt | 133⅓ | 18 | 13 | 23— | 18— | 20— |
| Sal ammoniac | 33⅓ | 19 | 5 | 1 | 15— | 13 |
| Sea salt | 66⅔ | 20 | 20— | 22— | 9 | 18— |
| Carbonate of soda | 66⅔ | 21— | 22— | 7 | 13— | 19— |
| Crude plaster | 133⅓ | } Could not be classed | | 6 | 17 | } Could not be classed |
| Salt | 16⅔ | | | | | |
| Crude plaster | 133⅓ | } Could not be classed | | 1 | 19— | |
| Salt | 33⅓ | | | | | |

The numbers marked — show that the crop obtained was inferior to that yielded by unmanured ground.

## SCOULAR'S IMPROVED GRUBBER.

Although a variety of implements, passing under the name of "grubbers" have been introduced into this district, none of them have hitherto so fully accomplished the purposes to which they are applied, as to supersede, to any considerable amount, the use of the common plough or harrow. I need scarcely say, that the point aimed at by the inventors of such implements has always been to get the soil cleaned and pulverised more easily and speedily than could be done by the old process; and that they have called them "grubbers" or "cultivators" according to their more peculiar adaptation to the one purpose or the other. The grubber which has hitherto been most approved in this county is that commonly known as Finlayson's harrow. I have long used it, and, in the main, with advantage; but still it is at best a very defective implement. When land is foul it constantly gets choked; it has such an effect in firming the soil, except on the mere surface, that it is always necessary to plough again after using it; and it is costly to purchase and keep in repair. I had often felt very anxious to get an implement free from these objections; and having, about a year ago, had lent to me by my landlord, Mr. Hay, of Dunse Castle, a pamphlet published 30 years ago by General Beatson, in which, after referring to the slim and contemptible looking implements with which he had seen the natives of India and China cultivate the soil, he figures and describes one of his own invention, with which alone he had succeeded in cultivating his farm. I was so convinced of the soundness of the principles propounded in this little treatise, that I sent it to Mr. Scoular at Haddington, whom I had long known as a skilful mechanic, asking him to read it with care, and to say whether he could furnish me with an implement, very much lighter and cheaper, and yet more effective than the grubbers commonly in use. Having heard about this time that several forms of light grubber had recently been introduced in different parts of Scotland, I was induced to visit a friend in Mid-Lothian, from whom I obtained much valuable information on the subject. On the same occasion I called upon Mr. Scoular, and found that just when I sent him General Beatson's treatise, he had been engaged in constructing a grubber, which he thought an improvement upon one which had shortly before been introduced into East Lothian from Ayrshire, and that he had got what he considered most useful hints from the pamphlet referred to. This Ayrshire implement having been first used on the farm of Traprain, is now currently known in East Lothian by that name, and has now come into very general use in that county. Through the kindness of my neighbour, Mr. White, Causeway-bank, I am enabled to exhibit one of them to-day, so that the members of the club may have the opportunity of comparing it with the implement invented by Mr. Scoular. He had several of these Traprain grubbers in his yard when I visited it in February last; but as his own implement appeared to me to be preferable in several respects, I purchased four, and shall now narrate my experience in using them. My first trial was upon a field which had been in Turnips the year before. These had been consumed by sheep early in the autumn, and the land ridged up about Martinmas, so that after the frost and rains of the whole winter, I found it too much weathered to admit of the seed being properly covered by the common harrows. I therefore sowed the Barley broadcast and then went over it with these grubbers, following it up with the harrows. The seed was as well covered as I could wish, any weeds that had sprung up were destroyed, and the surface soil nicely pulverised. The space gone over in a day by each implement was about four acres. My next trial of them was upon a field intended for Turnips. Part of this field had been under Potatoes in the previous rotation, and was very foul. After going over this piece of land, first lengthways and then across, the weeds were brought to the surface and removed with far less labour, and in much shorter time than I ever could do before. I may here mention that after the weeds had thus been brought to the surface, and well freed from the soil by frequent harrowing and rolling, I collected them by means of common hay-rakes. I have now ascertained that a given number of women will clear about five times more space in a day by raking than they could do by handpicking, and make quite as good work. I used in this instance the common hay-rakes; but I have found since that iron teeth, set a very little closer, do better than wooden ones. My next trial was upon a piece of very light moory soil, upon which the Turnips had just been consumed by sheep. This field I purposed to sow with Grass seeds without a corn crop. Part of it had already been ridged up and sown; but I resolved to try whether I could obtain a sufficient tilth on the remainder without using the plough at all. Taking advantage, therefore, of a moderate rain, which had softened the soil, I set these grubbers to work, and by going over it twice, I found my purpose effectually accomplished. The soil was stirred as deeply as was required, the manure kept near the surface, and a fine mould, most favourable for the brairding of small seeds, easily obtained. The ridges were then marked off by a ribbing plough, the seeds sown, covered in by Crosskill's Roller, and the whole work accomplished more speedily and satisfactorily than could have been done by ploughing. I was convinced, moreover, that had I wished to sow Barley, it could have been covered in by the second grubbing quite satisfactorily. Part of my Turnip break this year consists of a low lying boggy field, which was drained and brought into tillage for the first time about ten years ago. This I allowed to remain in the winter furrow until I was nearly ready to proceed with the sowing of it. It was then worked by these grubbers, and about three-fourths of it drilled up and sown without any ploughing. The remainder, not being so clean, got one furrow; and though sown in apparently as favourable circumstances, the crop is not nearly so good as on the part which was worked by the grubbing only. After my Turnip sowing was over, I found great advantage from the use of these implements in working a piece of strong clay land in bare fallow. From the size and hardness of the clods I was afraid, before trial, that here they would prove of little use, but in this I was agreeably disappointed. Since harvest I have again had recourse to them, and I think with advantage. From the earliness of harvest and the favourable weather, I have been enabled to do something towards cleaning a field intended for Turnips next year; and have found, as in spring, that the grubbers greatly furthered this process. Besides this, I have used them in preparing a piece of land for Wheat, after Potatoes. As soon as the Potatoes were removed it was twice gone over with the grubbers, and the Wheat drilled in immediately without any ploughing. Having a piece of Bean stubble alongside this Potato land, three ridges of it were, by way of experiment, worked in the same way, and from its present appearance it seems likely to do as well as the remainder which has been treated in the usual way. I have thus shown that this implement can be successfully applied to a great variety of purposes, and have no hesitation in giving it as my deliberate opinion, that by means of it much of our field labour can be accomplished in a better manner, and at greatly less expense, than by the customary processes. In particular I believe that if land intended for root crops be deeply ploughed in autumn, it can ordinarily be brought into a more favourable state for drilling, by working it with this or some similar implement, than by ploughing; and the reason seems just to be that the soil, which has been mellowed by frost, being kept a-top, and the winter sap retained, a good braird is almost certain to follow. I am convinced from what I have seen and heard, that in very many cases spring ploughing may thus be omitted with decided benefit to the Turnip crop, and with a very great saving of time and labour. The distinctive feature of this system of tillage consists in loosening and pulverising the soil to a sufficient depth without turning it over. This can be done by various implements; and I recommend Mr. Scoular's simply because I have proved it, and think it the best which has come under my notice. Its recommendations are that it is cheap—costing, with the apparatus for moving it from place to place, about 3*l.*; it is very light, of very easy draught, and quite under the control of the ploughman. It can be worked on the foulest land without checking, and it brings all fibrous rooted weeds to the surface without cutting them in pieces as the plough does. My object, however, is to recommend a system of culture, rather than a particular implement; and believing that these details of my own experience will be interesting to the members of this Club, I have had much pleasure in laying them before you. Being anxious to know how far the experience of others who had used this grubber agreed with my own, I some time ago applied by letter to six farmers in East Lothian, who, I ascertained, had tried them, from each of whom I got a most explicit and obliging answer in a few days, and who corroborate my statement in every particular. If time permitted, I should have liked to read their answers entire, but as I have already occupied much of your time, I

shall only make a few quotations. Mr. Turner, Northrigg, states that his farm consists chiefly of a strong clay soil—that he had tried this grubber chiefly in cleaning and preparing fallow for Wheat, the Turnip season being over before he got it. Its advantages he states to be cheapness, its keeping itself cleaner and freer in very dirty land—its easy draught (the Dynamometer showing that two horses worked it as easily as three did the common grubber)—and particularly that on his stiff soil the land when ploughed, after using this implement, turns up much freer and without that stiffness in the bottom of the furrow which he invariably finds after using the old heavy grubber. Mr. Wright, Hedderwick Hill, whose farm varies from stiff clay to rich loam and light sand, has used it with decided advantage in cleaning his fallows and Bean stubble; and by means of it sows his Turnips from the winter furrow without further ploughing. In preparing his Bean stubble for Wheat, he splits the drills with the plough before using the grubbers. Mr. Peacock, Papple, confirms these statements. His soil being also a strong one, he states that in preparing his land for Turnip sowing, he takes in only as much at a time as he can finish in a day, and leaves the remainder untouched until that is sown, as it sets into a solid mass when caught by rain after being so deeply pulverised. Messrs. Todrick, Spittal; Hall, Amisfield Mains; and Anderson, Huntington; testify to the same effect. The three first-named gentlemen use the Traprain grubbers as well as Scoular's; and while they are unanimous in commending *light* grubbers, are not quite decided as to which is in all respects the best. *Mr. Wilson, of Edington Mains, at the East of Berwickshire Farmers' Club.*

## Home Correspondence.

*Dairy Management.*—As I believe the management of milch cows to be superior here to that in any part of England—and more particularly so to that of my native county, Somerset, it may be interesting to tell you how I manage mine, and the quantity of produce I obtain weekly. I have a boiler containing about 40 gallons, and into it I put about 50 lbs. of Turnips, a considerable quantity of water, and about 12 lbs. of straw cut into chaff, and this is boiled for about two hours, when it becomes a dark nasty looking mess; one-half of this is taken out into two tubs, and whilst warm 1½ lb. of Bean or Pea-meal is stirred into each, and then given to each cow at about 110° of heat. That which is left in the boiler remains till morning, and if well covered up is still warm enough for use; it is then mixed with the Pea or Bean-meal, as before, and given to the cows at break of day; this, with hay *quantum suff.*, constitutes their daily diet; and I got about 6¼ lbs. of butter from each cow—I omitted to say I have only two cows. The butter produced in this way has no taste of Turnips, and the avidity with which the cows eat this boiled mess, is a good criterion of its value. When given to the cows, it should be thin and sloppy. *A Subscriber.*

*On Rabbit Keeping.*—I received your letter, and in reply, beg to forward you a plain account of my rabbit keeping. I have been in the habit of breeding rabbits, more or less, between 20 and 30 years. First, upon a small farm near here, and since, upon my present farm, of about 150 acres. The largest number of does I have ever kept is 101; but at this season of the year, I have only 50, and all the statements and calculations here given are based upon that number, with the addition of two bucks. The does rear from 12 to 14 each in the year; if ever a doe has more than seven at a time, I either kill them, or put the surplus to another doe; but it is seldom they have so many. With this number, I generally sell 12 every week, besides one now and then for my own eating. I contract, and a person fetches them away when from eight to nine weeks old; at this time, they weigh about 2½ lbs. to 3 lbs.; the price is, from the longest day to the shortest, 1*s.* per head, and from then to the longest day again, 1*s.* 2*d.* I feed them myself regularly four times a day; they require great attention to their feeding, and do better when always attended to by the same person. Their first meal is about a handful of Oats each; the second, a few sliced Swedes; the third, grains, with toppings, or a little Barley-meal; the fourth, good Clover hay, as sweet and green as I can find. The whole consumption, at this season of the year, is about two trusses of hay per week; 2½ to 3 bushels Oats and meal; 3 bushels Swedes, and 10 bushels grains, which would cost me about 15*s.* In summer, the food is varied; I give them Vetches or green Clover, and pick all the Crow Needles, Charlock, Hog-weed, and almost anything green, taking care not to have a bit of Hemlock, which would kill them; but I give them grains (which I get from the Tring Brewery, at 4*d.* a bushel), and a few Oats, all the year round. The sum received scarcely amounts to the entire cost of food; but the dressing is my remuneration. The present number makes me quite 10 bushels of dung per week, and although I buy other artificial manures (guano included), I do not find anything has so much effect upon my land as rabbit dung. I use it for various crops, sometimes with Turnips, at others as a top dressing for Grass and Wheat. I have always found that Wheat, dressed with rabbit dung, is ready for harvesting a fortnight before the other. I cannot estimate it at less than 6*d.* per bushel; it should be more. I keep my rabbits warm in winter, and cool in summer. Musty hay or bad food will soon cause them to die. I shall be happy to answer further if required. *Joseph Glenister.*

*Flue Boilers to Steam Engines.*—I dare say I am not the first or only farmer who has been plagued with black smoke and a bad draught from one's engine chimney. As I have conquered the difficulty, I may now save some pains and penalties to others. In my humble opinion, 9 out of 10 who fit up engines are rather defaulters as to flues. You are assured that no sweeping is required—that the draught will keep all clean, and so forth—the consequence is, that you find the engine that went off so freely when new and all the flues clear, gradually loses power, more stoking is required, and the neighbourhood is poisoned with smoke, which ought to be flame. The vexation and waste of coal is immense. Now I do assert that flues, especially in flue boilers—I mean those having a tunnel through the centre—should be set so that you can readily clean out, not only the brick flues, but that which passes through the boiler. On examining mine, by breaking through the brick-work, I found it almost choked by a fine heavy dust or sand from the coal or bricks, or both; I removed several barrow-loads. Surely such boilers should never be bricked up without accessible doors to clean them out occasionally. The moment you see a dense volume of smoke issuing from a steam chimney depend on it there is imperfect combustion and waste. I say, therefore, look to your flues and chimneys. When my man complained, "Sir, I cannot get the steam up!" "Well, are all your flues swept?" "Oh! yes." "Is the flue through the boiler swept?" "No, we can't get at that," and yet it was nearly full of sandy grit. Perhaps some of your correspondents can enlarge upon this subject. Flues should almost encompass the boiler, provided you have a high dome to it, to prevent its priming, or spoiling the water. P. S. An opening for cold air at the back of the bridge facilitates combustion. It is the want of draught caused by foul flues that causes the furnace bars to melt or warp. *J. J. Mechi, Tiptree, Jan.* 14, 1851.

*Poultry, Pinioning of.*—I am much obliged to your correspondent "H. Hottiman" for so gently correcting me in the ridiculous error I made, when employing the word "pinioning" in connection with Sir John Sebright's name. Far be it from me to impute to the late worthy baronet any ignorance on the subject in which he was so thoroughly versed. I take all shame to myself for writing so loosely. I should have expressed myself more intelligibly and more logically. The purport of Sir John Sebright's remark to me was, that with a view to try whether wild ducks could be rendered tame, and reconciled to the poultry yard, he had drawn out a number of their "flight" feathers. It was, as I observed, done merely by way of experiment; and I immediately made a note of the result. I hardly need repeat that Sir John's expectations were fully borne out. When the new flight feathers appeared, the ducks, naturally wild, took their speedy departure. All persons who have made the instinct of animals their constant study, can readily understand this. Nature's laws are universal, unchangeable. *William Kidd, New-road, Hammersmith.*

*Fat Breeding Stock.*—Allow me to suggest to the committee of the Agricultural Society of England, that instead of giving prizes to noblemen, gentlemen, and farmers who take a pleasure in feeding animals for the tallow-chandler, a place should be set apart for over-stuffed quadrupeds, in order that those who like such sights may be gratified, in the same manner that holiday people are amused with a Jack-pudding swallowing yards of tape, or any other extraordinary performance; but whilst the committee do not object to receive brutes weighed down with fat, let them not encourage men to cram animals, and reward them as a criterion of superior knowledge in farming. Any man with money can produce grease, and show oxen, sheep, and pigs unable to move without assistance. I have seen a pig, which for many weeks before it was killed, was fed by hand, being quite incapacitated, from obesity, from eating out of a trough. This disgusting proceeding was adopted for the purpose of bringing a certain breed into notice, and answered for a time—till it was found the expense of feeding such coarse animals did not pay. The object of the Agricultural Society being to improve the breeding and feeding of stock, I beg to point out the advantage that would arise from giving prizes for the best description of animals ready for the butcher, the most saleable and profitable to the owner and consumer. This desirable point can only be attained by insisting upon a Dr. and Cr. account being produced at the time of the exhibition. If the manufacture of lard and dripping can be proved lucrative according to £. *s. d.* value, let there be a few pens set apart, as those devoted to the interest of the grease and tallow-chandler. Rewards should only be given to men who show the finest and cheapest animals. Beef, mutton, and pork at 1*s.* per lb. may be wonderful to look at, but dissolves too much gold and silver at the present day. *Falcon.*

*Carrigeen Moss.*—The suspicions of your Beg Erin correspondent, in the *Gardeners' Chronicle* of the 4th, regarding Carrigeen, are correct. This vegetable production is certainly not a Moss, but belongs to the Algæ or sea-weed tribe, and is well known to the marine botanist as the Chondrus crispus. This plant, which is thrown abundantly on many parts of the English coasts, deserves a prominent place in the sick dietary, on account of its nutritive properties. It is a good substitute for isinglass for jelly or blanc-mange, and possesses one great advantage over the latter article for an invalid's night refreshment, as it never tastes perfectly cold; for this reason, however, I cannot agree with your correspondent in esteeming Carrigeen as "a delicate luxury" for the table to a healthy palate, added to which the strong saline taste can never be perfectly removed. With your correspondent, I confess that "I have never seen it growing," but I have collected it in great quantities on the Dorsetshire coast when thrown up fresh from the sea. In this state it is of a milk-white colour, but after being thoroughly rinsed in fresh water, and a long exposure to the sun in the open air, it changes colour, curls up, becomes extremely light in weight, in which state it should be packed away in paper bags, and kept hung up in a dry place for winter store. Carrigeen rarely nauseates, and has been known under my own experience to have been the sole support in several cases for some months, when the stomach would retain no other kind of food. It should never be given when the patient is suffering from diarrhœa, having a tendency to increase the complaint. *C. E. G.*

——Seeing another notice of the "Carrigeen Moss" in the *Agricultural Gazette*, and having seen two notices of a singular case in Carrot culture in the *Gardeners' Chronicle*, and seeing that neither has yet got from any botanist the consideration which the mere working farmer should expect, I am induced to trouble you again with a short notice of both, in the hope of stimulating further enquiry, if such be necessary. The plant called "Carrigeen" is noticed by Sir Robert Kane in his "Elements of Chemistry," page 878, under the head Lichenine, where he says: "This variety of starch, which is found in many Lichens, especially in the Iceland Moss and the Carrigeen (Spherococcus crispus), is not contained in the plant in grains, but in a soluble condition. To obtain it the Lichen is first digested in a cold dilute solution of carbonate of soda, to dissolve the bitter resinous principle; and this being completely washed away, the Lichen is boiled for a long time in water; a liquor is obtained, from which, on cooling, the Lichenine separates as an opaque grey jelly, which when dried is black, hard, and glossy. Its properties are very similar to those of Inuline. It gives with iodine a greenish-brown colour. Its composition is expressed by the same formula as the others. (Starches,) $C_{12}H_{10}O_{10}$." On reading the above I again looked into the "Flora Hibernica," by Dr. Mackay, where I find he has arranged this plant differently, and under a different name to Spherococcus. He calls it "Chondrus crispus," or curled Chondrus, and describes it in his "Algæ Rhodospermæ," pages 201 and 202. He says "it grows on our rocky shores very common, very variable in size, shape, and colour (often of a full green); yet the accustomed eye will find little difficulty in recognising it under all its varieties. On our western shores it is collected in large quantities by poor women and children, and sold under the name of Blancmange-weed (or as they call it Bullamonge). At one time it sold in Dublin at 2*s.* per lb., but latterly the price has greatly fallen away. It may now be bought, washed and dried, on the west coast of Clare, at from 1*s.* to 1*s.* 6*d.* per stone of 16 lbs." Your readers, who are, if any there still be, anxious to inquire about this plant, should bear in mind, that when Doctor Mackay speaks of "one shilling to one shilling and sixpence a stone of sixteen pounds;" he was speaking of such things about 20 years ago, when Potatoes were plenty, and such scenes of death from starvation did not occur, as you must have read of, but which *I saw* on the other coasts of Ireland, besides the coasts of Clare, outside the poor-houses of Scariff, Kilrush, Schull, Bantry, and Skibbereen, where I could get hundreds, nay thousands of once and lately able-bodied men to work for 2½*d.* to 5*d.* per day, of 12 hours, without meat or drink, and poor women and boys to carry this or any other sea weeds on their backs, 6 to 10 miles, at from 1*d.* to 2*d.* per hundred weight of 112 lbs. Judge, then, what now, or henceforward, may be the price at which "Carrigeen Moss" can be purchased at on the "coast of Clare, Cork, Kerry, Galway, or Mayo." Should any one desire to purchase it, your readers, I say, can now judge for themselves on this subject, without my inflicting further pain on them; such as I must ever feel myself when such things as I have seen are stirred up in my memory, no matter from what quarter. *Edward Carroll, Beg Erin, Castlebridge, Wexford, Jan.* 16.

## Farmers' Clubs.

HALESWORTH, *Dec.* 20: *The County Expenditure.*—The following resolutions were unanimously agreed to:—1. That we regard it as a settled maxim of the British constitution, that taxation and representation should be inseparable; and that, with the exception of the county rate, every tax to which an Englishman is liable, is made with the consent either of him or his representative. 2. That, as a consequence of the rate-payers having no control over it, the amount of money raised as county rate has, within the last twelve years, enormously increased in this county, as well as in others. 3. That various instances of extravagant expenditure of the county funds have been proved to have been, and to be still in existence. 4. That if the said funds were confided to the management of county boards, composed of representatives sent by different boards of guardians, we are fully convinced their amount would, under improved regulations introduced by men of business, be very greatly reduced. 5. That the accounts of such funds ought, at certain fixed times, to be audited and published for the information and satisfaction of the rate-payers. 6. That the decrease in the value of all agricultural produce, which has been caused by recent legislative measures, renders it more than ever imperative on British farmers to seek, by all constitutional means, a reduction of the burdens pressing upon them.

7. That petitions to both Houses of Parliament, praying them to pass an enactment giving the rate-payers the control of the county funds, be previously to our next meeting prepared for the signature of the members of the Club. 8. That these resolutions be printed, and a copy of them sent to the editors of the county papers; to the London and other agricultural journals; to the secretaries of the Winchester Farmers' Club, and of each of the other farmers' clubs in Suffolk and Norfolk. *Thomas Bishop, jun., Secretary, Chediston, near Halesworth, Dec.* 24.

SPROTBRO': "*The best method of Storing Turnips for Spring Feeding.*"—Mr. M. Clarke observed that he was not at all satisfied with his own experience, and was therefore desirous of hearing from the members present something which would improve his present system. He alluded to the several methods which he had seen. He found that by leading off the Turnips in frosty weather the crop of Barley was affected. Turnips pulled off and thrown up against a wall, and then covered with straw, were kept as successfully as by any plan he was aware of. It was urged by some, that sooner the Turnips were pulled off the better, but yet he thought that it was as well for those to remain on the land which were required to be consumed upon it, or at all events until they were fully grown. He had observed some parties, in taking up their Turnips, cut off the tops, and leave them on the ground to be ploughed in. He should be glad to hear from any present their experience upon such a system.—Mr. Newham, of Edlington, said that it was highly necessary to have the Turnips which they required for spring food taken up before the frost came. Some would take them up while in a frozen state. This was highly improper. It was requisite that they should be taken up when fully ripe, and they would best ascertain this in the clean manner they would leave the earth, by the fibres not in the least adhering to it. They would find Turnips left in an exposed situation very much deteriorated in value. His plan of preserving Turnips was carefully to shut out the effects of the west wind, and on that side of the pie he built a wall of stubble, covered with thatch, and instead of fastening it down as they did their corn stacks, he had the thatch rods laid in straight, so that by this means the water run off. The other side was also covered with straw in a similar manner; and he found the Turnips would remain good until spring. He was now placing about three loads in a heap. It was requisite they should have air. He strongly recommended that the Turnips should be taken up as early as ripe, and never allowed to make a second growth, as this would prove very injurious to the land. The following crop would be found to be much better than when they were allowed to grow again. He always avoided leading Turnips in frosty weather. They never kept well, and would generally become rotten. The plan he conceived best adapted for preserving Turnips was having them got off the land when fully ripe, not in a frozen state, and placed together in heaps in the manner he had described, and they would be found to keep well until the end of June. If they placed the tops of the Turnips upon the heaps they would rot, and it would be found that where the heaps had been placed there would be found a superabundance of tillage, and the succeeding crop injured rather than benefited. There was a large amount of tillage in the tops of Turnips, and it was quite natural to suppose that if they allowed them to rot upon the land the corn crop would be much better. They would find that frozen Turnips did not contain the same amount of food as those which were not so, and therefore not so good for their sheep and cattle; although it would be generally allowed that sheep improved more in frosty weather than in any other, provided their food was of good quality. He avoided cutting the Turnips as much as possible, and would rather give his workpeople a little more money to have them done well than otherwise. He was satisfied that a large amount of money was yearly thrown away from inattention to this point. He had the tops of the Turnips taken away and given to the ewes on the Grass, or to the cattle in the yards. There was undoubtedly a great amount of nutrition in the Turnip top, and he thought it better to have them consumed rather than plough them into the land. He had no doubt that ploughing them into the land would be productive of good to the land, but still he thought it a slovenly plan, and not worthy of general adoption. He preferred giving his Turnip heaps a south-east aspect, having a heavier portion of thatch placed upon the western side of those heaps in the fields. They did not require the Turnips to remain so long in the fields as they did those which were brought home. Hogs in high condition would suffer much by giving them Turnips deteriorated in value. Frozen Turnips would lose their colour, which could only be regained by allowing them to grow again, at an injury to the land. It was never in his opinion too soon to cut Turnips if they were only ripe, and he considered that those which had been taken up early and preserved were always better than those which had been pulled fresh. He had frequently found that those Turnips which were pulled the first would keep the best.—Mr. S. Vickers said that he did not remember a year when Turnips kept so well as last, although they grew until nearly Christmas. His Turnips this year were sown on the 3d, 4th, and 5th of June, and were still growing. What were intended for spring food he had led into the stack-yard and placed together in heaps of from 10 to 15 loads, covered with straw, and not quite air tight; and these last season were beautiful. Those which remained in the fields were covered with tops, but these decaying they were further covered with straw, and were remarkably good. Where the tops had decayed upon the heaps, their decomposition tainted many of the Turnips, and caused the Barley to be there more luxuriant than in other parts of the field, so much so that the crop was the first to be laid, and the extra tillage of the Turnip tops a positive injury. It was of great importance to know when the Turnips were really ripe, and if they were taken up in a frozen state, they would certainly rot. He always found, with Mr. Newham, that the west side of the field was the most unfavourable for preserving Turnips. After some further remarks, the meeting came to the following resolution:—"It is recommended that Turnips for spring feeding be cut as soon as ripe, placed in pies, with a south-east aspect, covered well with thatch, and on no account parted while in a frozen state."

## Miscellaneous.

*Beans as Cattle Food.*—In 1825, a sweepstake was entered into by five East-Lothian farmers, to be claimed by the one who should be pronounced the best feeder of cattle. In order that an equal chance should be enjoyed, Mr. Charles M'Combie, then an extensive dealer in Aberdeenshire, was instructed to forward 40 long-horned Aberdeen cattle. These were of the same age, and in equal condition, and were divided as fairly as possible among the five farmers. The price was 18*l.* per head. The cattle were put up to fatten in the second week of September. There was no restriction as to feeding. At Christmas following, they were exhibited at Haddington, and the improvement was most remarkable. The late Mr. Lee, of Skateraw, was declared the winner. He had used boiled Beans throughout in feeding. The other competitors fed very high, as on draff and dregs, Swedish Turnips, hay, bruised Beans, and Oats. The superiority of boiled Beans was here proved—a fact which deserves the particular attention of cattle-feeders at the present day. *Dickson on Breeding Live Stock.*

*Agricultural Tours.*—South-country farmers have generally but an imperfect or erroneous idea of the resources of the north of Scotland, which a personal inspection can alone correct. In Caithness, an exhibition of live stock is held in July, where there is generally, both in respect to numbers and quality—particularly as regards Short-horned cattle and Leicester sheep—as fine a show as in more favoured districts. These breeds, it is erroneously supposed, are not sufficiently hardy for this northern latitude; but an inspection of the animals collected at the above annual exhibition will prove the contrary. Every young man who intends following the occupation of a farmer should make such tours; but the sons of farmers are often prevented from obtaining the information they require, from the work at home occupying all their time. It would be well if farmers were to allow their sons sufficient opportunities to visit, at least, the markets and agricultural shows in their own localities, and not grudge the money or time thus expended. By means of visiting distant localities, young men are enabled to become acquainted with the general progress of agricultural improvements; and thus is created in them a spirit of emulation which stimulates to similar improvement on their own farms. How else is it to be expected that young farmers can be excited to such a spirit of emulation, if they are kept at home, toiling with their fathers in the dark, as it were, and following the empirical routine of their grandfathers? There are yet, even in this age of improvement, many farmers content to follow in the steps of those of the "old-school"—their sons seeing nothing, and therefore having faith in no system different to that they have followed from their youth up. The consequence is, that when they possess farms of their own, they have nearly all the elements of the improved systems of agriculture to learn. *Dickson on the Breeding of Live Stock.*

*Feeding Sheep.*—The practice of feeding sheep, netted or flaked on the land, and feeding on lea or Grass land with Turnips, has been much discussed of late, particularly by the Ayrshire farmers. They seem all to agree that feeding with Turnips on Grass land is not only the best, but most economical system. This may be the case in Ayrshire, where the climate is in general wet and moist, and much of the soil rather close bottomed and retentive. They also take the merit of feeding sheep better than the feeders in Forfarshire—affirming that their wedders of the same appearance fetch 2*s.* a-head more in the Glasgow market than those fed in the latter county. This is not generally understood, even by the Glasgow fleshers, as few counties can beat Forfarshire in this particular; but fat sheep, like many other good things, often come out of places from whence they are least expected. At one time, East Lothian and the Border counties were the only districts in Scotland famed for feeding sheep; but now almost every locality puts in its claim. Generally speaking, the preference is still to be awarded to East Lothian, particularly near Dunbar—the land in that neighbourhood being open bottomed, resting on a strata of red sandstone. Sheep will feed faster netted on the Turnip land, than when the Turnips are laid on Grass land. All East Lothian feeders are agreed on this point. The great point in feeding sheep with Turnips, either hoggs or old sheep, is to commence as early as possible, say about the middle of September, or at all events before the 1st of October. The Turnips should be given on fresh pastures for the first month, and afterwards treated as already mentioned. When feeding Leicester hoggs, the Turnip tops should be cut, as previously recommended, which will prevent many deaths. Regular shifting every four or five days, or not longer than a week, should also be attended to; and a supply of stored Turnips always at hand to give the sheep, in case of severe frosts, more especially when feeding on Grass land. *Dickson on the Breeding of Live Stock.*

METEOROLOGICAL REPORT.—JAN.

* Could this fall of the barometer, and the low state of the thermometer, be owing to a storm at a great distance to the westward, and travelling northward?

† This storm passed up Channel, eastward and northward, producing fogs on the 6th and 7th.

‡ A storm travelling nearly due north; it passed west of Ushant at 11 A.M., and near Plymouth at 2 P.M. of the 8th.

§ If all the rain that fell during the 11th, 12th, and 13th was produced by the same storm, it must have travelled *very slowly* from the south; but I think it will turn out, on inquiry, that on the 11th and 12th a storm was travelling eastward up the Mediterranean, causing the unusually high temperature of those days.

‖ From the 13th to the 16th this storm was travelling northward; the wind on the 15th veering regularly as it passed to the westward of this island. I subjoin the detailed observations of that day, as a beautiful instance, rarely occurring on shore, of the coincidence between the fluctuations of the barometer, and the veering of the wind from SE., SSE., S., SSW., SW., W., WNW. Having passed off to a colder latitude, the back draught of it produced a frost on the night of the 15th.

| Date. | Time. | Bar. | Wind. | REMARKS. |

## Calendar of Operations.

### JANUARY.

FEN FARM, *Jan.* 14.—Seeing the remark from one of your correspondents, "Everything is dull," apparently applied to the business of the farm, I merely write to show that it is not so in all cases. The diminished and inferior produce of last years' corn crops, the falling prices of the present period (excepting sheep and wool), are truly causes of depression of mind to hundreds of worthy industrious men, whose sufferings and losses will not permit them to take any pleasure in prospects of the future; but with all those who hope to weather the storm, who have trimmed their sails, taken an observation and steered truly, this season of the year is not so very dull after all; to see the result of your past cares in the shape of large pies of Turnips and Mangold Wurzel disappearing before the bullocks and sheep; to notice the varied effect on each head of stock of cake, roots, straw, hay, chaff, shelter, or other treatment; to notice the growth of the young stock, to change the fold for the sheep, to provide a sufficient supply of Turnips or dry food to ewes on grass; to store away manure, and remove the accumulated heaps and piles in alternate layers; the well-trodden compound from beast stalls, boxes, stables, and crew yards, saturated with tank liquor, and swelled with

town much, and topped with road scrapings, refuse heaps, or dyke bottomings, will sufficiently awaken into activity and stimulate reflection. The Wheat grows vigorously, requiring only a gratulatory glance, unless the slugs want a few barrowsful of salt, or cart-loads of lime, *if* the drains are right; and here is sure to be some signs of life; the outfalls all require clearing, deepening, or straightening; the brinks of the ditches want levelling, and rubbish removing; the hedges trimming and cleaning; gaps stopping, old stumps thinning out, and the spray carefully twined in; and nowhere is intelligence more necessary than in the management of the old hedge-row, hewing out the encroaching Elder, grubbing up the indigenous Elm, Ash, and Bramble, which chokes and weakens the more tractable and useful Thorn, invariably sensible of judicious treatment by the neatness, straightness, and *strength* of a narrow and well-kept fence. Dulness will vanish with the stroke of the axe; the clink of the tile, the rush of the water, converting a chill and poisonous swamp into a warm and fertile field. Oh, how much to do, and who is to do it? Neither the boasted old race of farmers, nor the mere aristocratic landlords, can do it. A new and vigorous effort is required, and will be forthcoming. "Sweet are the uses of adversity." All *men* shall be considered as countrymen; the only castes which will be retained are honesty and ability, as opposed to idleness, ignorance, and vice. The landlord shall no longer be the man-lord; the farmer no longer a subservient and servile clod; the labourer no longer a mere machine. Slavery will disappear with that cursed pride of mere station which has so long paralysed and bound the energies of the agriculturist; and now the true but homely axiom is to reign, that a man's proper station is that which he can worthily fill. *J. W., Peterborough.*

## Notices to Correspondents.

BONES: *R N C.* We know nothing of the bone trade, and cannot introduce you to any London dealers.

BUSBY'S PRIZE CART: *Tuesday.* It is a thoroughly practical one; can be copied by any village wheelwright; and, after the first, could be made cheaper than the common ones, having less carpentry and less iron work; for the principles, see Mr. Thomson's Report on Implements at the York Meeting of the Royal Agricultural Society, Journal, Vol. IX.

OSIERS: *K L.* The subject is discussed at page 69, vol. for 1845. You had better get cuttings of the right sorts from neighbouring osier grounds; for we know, if you can procure them safely by their botanical names, Salix triandra vitellina, and rubra, are considered the most useful for fine work. S. Forbyana and viminalis are rapid, strong growing kinds. Pieces 2 feet long of the two or three year old shoots, stuck 1 foot in the ground, in rows about 2 feet 6 inches apart, and 2 feet apart in the rows.

POULTRY: *C S.* Next week.

PUBLIC DRAINING ACTS: *X X.* The General Land Draining and Improvement Company (46, Parliament-street, Westminster), have powers "to contract for and execute all works for draining, navigating, warping, reclaiming, inclosing, fencing, *building* on, and otherwise improving flooded, uninclosed, waste and other lands, with money to be advanced by the Company, or by other parties." This hardly meets your case, we suspect; but you had better apply at the above address for further particulars.

RAT! RAT! RAT! *A Constant Subscriber.* It was reviewed in Dickens' "Household Words," and our knowledge of the pamphlet is confined to what was there said of it.

READING FARM: *G W.* Your critique refers more to grammatical than agricultural errors: and we do not think it would serve any useful purpose to publish it.

SHED-FEEDING SHEEP: *G S.* asks for the experience of farmers on the practice of open-shed-shelter of sheep in fields in winter.

WHITE CUMBERLAND BREED OF PIGS: *H T.* Apply to Mr. James Knowles, Tortworth, Wootten-under-Edge, Gloucestershire.

YOUATT'S TREATISE ON THE HORSE: *Yorkshire.* If you compare the two editions, you will find that the present one, advertised at 10*s.*, has been fully revised, so as to render it, in many respects, a new work. The chapter on the Diseases of the Horse confirms this remark. And it is also in other respects new. The wood engravings are all new. This work contains 50 or 60 pages more than the other edition of it; and 2*s.* is not an addition to the price which will be complained of by any one comparing the two editions.

# Markets.

## COVENT GARDEN, JAN. 25.

Hothouse Grapes and Pine-apples are scarce and dear. The supply of good dessert Pears is also limited. Apples are sufficient for the demand. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Forced Vegetables of all kinds are abundant and good. Seakale, Asparagus, and Rhubarb are excellent. French Beans are more plentiful. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1*s.* 3*d.* per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Cinerarias, Chrysanthemums, Roses, and the different kinds of spring bulbs.

### FRUIT.

JOSHUA BAKER.

### HOPS.—FRIDAY, Jan. 24.

Messrs. Pattenden and Smith report that the demand for Sussex Hops is on the increase; fine Weald of Kents are also in better demand.

### POTATOES.—SOUTHWARK, Jan. 20.

The Committee report that the market was well supplied with Potatoes from the Continent and coastwise, and though trade had been better this last week, it was only with a few fresh cargoes better prices had been made. The following are this day's quotations:—York Regents, per ton, 80*s.* to 100*s.*; Scotch do., 60*s.* to 75*s.*; ditto Cups, 60*s.* to 65*s.*; Cambridgeshire and Lincolnshire Regents, 60*s.* to 80*s.*; French whites, 50*s.* to 65*s.*

### COAL MARKET.—FRIDAY, Jan 24.

Eden Main, 14*s.* 6*d.*; Wallsend Tees, 16*s.*—Ships at market, 46.

### SMITHFIELD, MONDAY, Jan. 20.

There was a larger number of Beasts, and the average quality was good. The morning being cool, purchasers were plentiful, but prices were not higher. The supply of Sheep had also increased; the trade was more cheerful than on Friday, but it was difficult to make any more than on Monday last. Good Calves were scarce, and dearer. From Holland and Germany there are 366 Beasts, 110 Sheep, and 82 Calves; from Norfolk and Suffolk, 2000 Beasts; from Scotland, 500; and 900 from the northern and midland counties.

| Per st. of 8 lbs.—s | d | s | d | Per st. of 8 lbs.—s | d | s | d |

| | | | | Pigs ... ... | 2 | 8 — 3 | 4 |

Beasts, 4327; Sheep and Lambs, 20,670; Calves, 119; Pigs, 285.

### FRIDAY, Jan. 24.

Although the supplies of all kinds of stock are but small, they are fully adequate to the demand; indeed, prices generally are barely so good as on Monday. The quality of Beasts is still middling; in consequence, choicest qualities make 3*s.* 8*d.* Good Calves are in a few instances dearer, but we cannot quote higher on the average. Our foreign supply consists of 60 Beasts, 420 Sheep, and 122 Calves; from Norfolk and Suffolk, 300 Beasts; from Scotland, 39; and 78 milch cows from the home counties.

Beasts, 615; Sheep and Lambs, 3850; Calves, 200; Pigs, 295.

### MARK LANE.

MONDAY, JAN. 20.—The supply of Wheat to this morning's market from Essex and Kent was small; some of it being in better condition met a more ready sale than this day se'nnight, but the damp was difficult to quit. Old foreign was in improved request; nevertheless, the amount of business was limited.—Barley, Beans, and Peas move off slowly at our quotations.—The Oat trade is heavy, and late rates are barely supported.—Flour is in somewhat better demand, but at no improvement in price.

FRIDAY, Jan. 24.—The arrivals of grain this week have been moderate. The attendance at market this morning was even worse than of late, and prices of all articles may be considered nominally the same as on Monday, with scarcely any business doing. The late fleet of southern vessels on the coast have been pretty well all disposed of; the last price realised for fine Polish Odessa Wheat afloat was 35*s.* per qr.; for Galatz Maize the last price paid was 30*s.*

LIVERPOOL, FRIDAY, JAN. 17.—The imports of grain during the last three days are trifling; none from the United States; only one cargo of foreign Wheat—1420 qrs. from Egypt, and 344 sacks of French Flour. For the same time the exports to Ireland and coastwise consist of 3 30 quarters of Wheat; 944 barrels, and 444 sacks of Flour; 1534 qrs. Indian Corn, and 535 barrels of Indian meal. There was no activity in this market, and considering our heavy stocks, not so much choice of samples of Wheat and Flour offering. Purchasers, however, would only take retail quantities of any article, and the quotations of Tuesday last remain without the slightest change.

—TUESDAY, JAN. 21.—The arrivals this week are alike small of every article of the grain trade, while the exports to Ireland and coastwise are tolerably extensive. There has been no perceptible change in the value of any article during the week; the demand has been slack, and purchases have only been in retail. There was about the usual attendance of millers and dealers at our Corn Exchange this morning. All kinds of parcels of American was taken to hold over; very full prices were obtained, but no advance was established. Flour, both sacks and barrels, also sustained the rates of this day se'nnight. Oats were neglected, but Oatmeal was in favour, at a small advance. Barley, Beans, and Peas were unaltered in value. There was rather more doing in Indian Corn than of late, and a sale of American mixed was reported, at 29*s.* 6*d.* per 480 lbs.

GLASS FOR CONSERVATORIES.

JAMES PHILLIPS AND CO. have the pleasure to hand their New List of Prices of GLASS for cash.

CUT TO SIZE.

| 12 „ by 9 „ | | 14 „ by 10 „ | |

Boxes charged 1*s.* each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to how, sending afterwards the inferior, described as above.

GLASS SHADES FOR ORNAMENTS.—Our price is 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the quality of Milk: four tubes in frame, 6*s.* each. Wasp Traps, 3*s* per dozen. Stands for Pianofortes, 9*d.* each.

MILK PANS 2*s.* to 6*s.* each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Pastry Slabs; Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

N.B. The moderate charge of 1*s.* for each packing case will be made, which we think will be an inducement for parties to retain them; but if sent back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

SMITHFIELD CATTLE SHOW.—MILK PANS, in stout Glass, of every size and variety of shape, were exhibited as usual, Nos. 148, 149, 150, Bazaar, by Messrs. COGAN and Co., whose collections were honoured (among other Prizes) with the Silver Medal of the Dublin Society in April, as also with the Silver Medal of the Liverpool and Manchester Society, at their meeting, held at Warrington in September last.

NOBLEMEN, FARMERS, and the Public generally, are respectfully invited to notice the NEW GLASS CHURN. LORD CAMOY'S MILK SYPHONS for separating Milk from Cream, GLASS LACTOMETERS for ascertaining the quality of Milk, New Bee Glasses invented by Lord Keane, Glass Cream Pots and Pans, Glass Milk Trays, Glass Tiles and Slates, and every description of Dairy Glass.

Durable Farm Paints, Glass for Hothouses and Garden purposes, may be had (safely packed) for any part of the kingdom, or for exportation, on application at the Warehouse, 48, Leicester Square, London.

Small Glass for Melon Pits of every size, from 10*s.* 6*d.* per 100 feet; Hartley's and Swinburne's PATENT ROUGH PLATE at the Manufacturer's prices,

Glass Ornamental Shades, Fern Shades, Lamp and Gas Glasses, Patent Glass Pens; Patent Texturalised, Silicated Marble, and other Ornamental Glass, supplied, as usual, at 48, Leicester-square; the Colour and Lead Department, at 5, Prince's-street, Coventry-street, London.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND CO. supply 16-oz. See the *Gardeners' Chronicle* first Saturday in each month.

# GRAY AND ORMSON,

## DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

---

HEALE'S NURSERY, DEVIZES, WILTS.

To Noblemen, Gentlemen, Nurserymen, Florists, and others, engaged in planting Important and unreserved Sale.

MR. FREDERICK ELLEN has received instructions to sell by Auction, on the premises, on MONDAY, 3d February, 1851, and following days (Thursday excepted), the whole of the choice and valuable NURSERY STOCK of Mr. Wm. Heale, Jun., under a deed of assignment for the benefit of creditors, comprising upwards of 30,000 fine English and Turkey Oak, several thousand Weeping and other Ash, Lime, Elm, Birch, Beech, both common and purple; 200,000 very fine Larch, Spruce, and Scotch Firs; 1500 Weymouth Pines; a few fine specimens of Ford's Oak; English and Irish Yew; about 300,000 of fine seedling and transplanted Thorns, seedling Oak, Ash, Spruce, Scotch, Larch, and Silver Fir; a quantity of common Laurels, Evergreens, ornamental Shrubs, American and coniferous Plants; choice stock of standard, dwarf, trained, and untrained Fruit Trees in great variety; 1500 fine Filberts; about 2000 Stove and Greenhouse Plants, and every other article in the trade for which Heale's Nursery has been so highly celebrated. Two well-built Greenhouses, one Stove, and one Propagating-house and fixing; single and double light Frames, Glasses; 5000 Seakale and flower pots; five spring and tip Carts, spring Waggon, Horses, Harness; two Sow Pigs; Stack of Hay; 30 Sacks of Potatoes; Agricultural and other Seeds; 12 tons of Mangold Wurzel, and numerous valuable property.

The above Nursery Stock is in a thriving and healthy condition, and will be sold without reserve, and offers to Gentlemen, Nurserymen, and others engaged in planting, an opportunity seldom to be met with. The Stock may be viewed any day previous to the Sale, commencing at 11 o'clock each day. —Catalogues may be had at the principal Inns in the county, on the premises—and of the Auctioneer, Andover and Devizes.

---

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, January 27, 1851, at 2 o'clock precisely, by order of Messrs. Antony Gibbs and Sons, the Importers, about 1200 tons (damaged) PERUVIAN GUANO. Catalogues and further particulars, in due time, from J. A. Rucker and Bencraft, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

---

GLOUCESTERSHIRE.

ROYAL NURSERY, CIRENCESTER.

IMPORTANT AND EXTENSIVE SALE OF NURSERY STOCK.

To Noblemen and Gentlemen who may be about to make extensive Plantations and Ornamental Shrubberies, and to Nurserymen and the Trade generally.

THE FIRST OF A SERIES OF SALES.

JEFFERIES and CO. have been favoured with instructions from the Assignee of the Estate and Effects of Mr. William Gregory, to submit to public competition, upon the above-named premises, the whole of his NURSERY STOCK, the first portion of which will be prepared and offered on TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, and SATURDAY, the 28th, 29th, 30th, and 31st of Jan., and the 1st of Feb., 1851, including more particularly 5000 Grafted Elms, from 4 to 14 ft.; 10,000 Limes, 3 to 15 ft.; 20,000 English and Turkey Oaks, 2 to 8 ft.; 70,000 Ash, 2 to 6 ft.; 30,000 Larch, 1 to 3 ft.; 100,000 Spruce Firs, 1½ to 6 ft.; 50,000 Scotch Firs, 1½ to 3 ft.; 10,000 Balm of Gilead and Silver Firs; 6000 Weymouth Pines, 1 to 5 ft.; an immense quantity of Quicksets; 3000 Purple Beech, 2 to 12 ft.; together with a large quantity of Pinus austriaca, Pinus Laricio, Poplars, Beech, Hornbeam, Hazel, Maple, &c. Also an immense number of Standard, Dwarf, and Dwarf-trained Apples, Pears, Plums, and Cherries; Gooseberries, Currants, Raspberries, &c. Common and Portugal Laurels, Sweet Bays, Alaternus, Phillyreas, Red Cedars, Arbor Vitæ, Irish Yews, Common Yews, Tree Box, Lucombe's Oaks, Laurustinus, Aucubas, Mahonias, Variegated and Green Hollies, Evergreen and Box-leaved Privet, Standard Cratægus and Cytisus, with a general assortment of other kinds of Shrubs and Ornamental Trees. The well-known Stock of CONIFERS, which is not to be surpassed in the kingdom, is comprised of 80 species and varieties of Pinus, 35 Abies, 10 Piceas, 56 Juniperus, 21 Cupressus, 21 Thujas, 17 Taxus; Taxodiums, Araucarias, Cedrus, Cryptomerias, &c., of various sizes. The Stock of ROSES, both Standard and Dwarf, contains the choicest in cultivation, and in great variety. The Collection of Greenhouse and Stove Plants is extensive, and embraces many fine Specimens.

Catalogues of the First Series are in course of preparation, and will be issued at the earliest possible period prior to the sale. To be had at all the principal Inns in the neighbourhood; upon the Premises; at Baily and Jones's Printing Office; and at the Auctioneers' Office, Dyer-street, Cirencester. In consequence of the shortness of the days, the sale will commence at 11 o'clock.

The whole of the Stock will be sold in Lots to suit every class of purchasers, and may be viewed any time on application to Mr. R. Rea, at the Nursery; and every assistance will be given to purchasers in the removal and packing of their several lots.

As the whole of the above Stock has been grown under the superintendence of Mr. R. Rea, he begs to state that he will be happy to receive and execute any Commission with which he may be entrusted by parties residing at a distance.

---

NOTICE TO SEEDSMEN.

TO BE GROWN BY CONTRACT—1851.

ALTRINGHAM, SURREY, and HORN CARROT SEED; MANGOLD WURZEL, PEAS, &c., of true selected stocks. References given if required.—Letters, addressed T. B., Post-office, Colchester, Essex, will have immediate attention.

---

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

THE IRISH AMELIORATION SOCIETY beg to draw the attention of the public generally to the fertilising and deodorising properties of Irish Peat Charcoal. Mixed with night-soil or sewage matter it instantly and wholly destroys all offensive smell, renders it easy of manipulation, adapts the fertilising properties as a ready food for plants, and enables it to be transported by Railway or any other conveyance without the slightest inconvenience.

The extent to which Charcoal (carbon) enters into the composition of every article of agricultural produce, and the value of night-soil as a manure, render any observations on these points unnecessary. Mixed with night-soil, in about equal weights, a most efficacious manure is produced at a very small cost.

Price of the Charcoal, ready for use, at Dublin, exclusive of sacks, 35s. per ton; in London, Liverpool, Bristol, and other seaports in England, 48s. per ton, exclusive of sacks; or 60s. per ton, sacks included.—Agents will be forthwith appointed in all the principal towns in England.

Head Office, 9, Waterloo-place, London.

Jan. 25, 1851. L. Parrott, Secretary.

---

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, Lea and Perrins, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "Lea and Perrins" are upon the label and patent cap of the bottle.

---

MATRIMONY MADE EASY; OR, HOW TO WIN A LOVER.—Miss Norrington continues to send free to any address, on receipt of 13 postage stamps, and a directed envelope, plain directions to enable Ladies or Gentlemen to win the affections of as many of the opposite sex as their hearts may desire. The proposal is simple, and so captivating and enthralling that all may be married, irrespective of age, appearance, or position; young and old, high and low, are alike subject to its influence; and last, though not least, it can be arranged with such ease and delicacy that detection is impossible.—Direct, Miss Lavinia Norrington, 7, King's-terrace, Bagnigge-wells-road, London.

N.B.—Beware of ignorant pretenders.

---

CLOSE OF HOLIDAYS.

NOW that the season of annual festivity is about to terminate, and the respective boarding-schools reinstated by the busy throng of youthful aspirants, their personal comfort and attractions become naturally an object of great solicitude with friends and relatives. Now it is that ROWLANDS' MACASSAR OIL, for accelerating the growth and for improving and beautifying the hair, ROWLANDS' KALYDOR, for improving the skin and complexion, and removing cutaneous eruptions, and ROWLANDS' ODONTO, for beautifying the teeth and preserving the gums, must be universally considered indispensable. The august patronage conceded by all the Sovereigns of Europe to these creative and renovating specifics, and the confirmation, by experience, of their infallible efficacy, have characterised them as perfect, and given them a celebrity unparalleled. ☞ *Beware of Spurious Imitations.* The only genuine of each bears the name of Rowlands' preceding that of the Article on the Wrapper or Label. Sold by them at 20, Hatton Garden, London, and by respectable Chemists and Perfumers.

---

THE BEST REMEDY FOR INDIGESTION.

"NORTON'S"

CAMOMILE PILLS are confidently recommended as a simple but certain Remedy, to all who suffer from Indigestion, Sick Headache, Bilious and Liver Complaints They act as a powerful tonic and gentle aperient, imparting strength to the stomach, and composure to the nervous system. Sold in bottles at 1s. 1½d. or 2s. 9d. each, by A. Willoughby and Co., late B. G. Windus, 61, Bishopsgate-street Without, and nearly all Medicine Vendors.

Caution.—Be sure to ask for "NORTON'S PILLS," and do not be persuaded to purchase an imitation.

---

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1s. Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of John Willis accompanies each packet.

---

Price 1s., or free on receipt of 18 stamps,

GLENNY'S GARDEN ALMANAC and FLORIST'S DIRECTORY for 1851, containing Directions for the Management of an Amateur's Garden during the year; Lists of the best Show Flowers, Fruits, Plants, and Vegetables; useful information for Emigrants, &c.

London: C. Cox, 12, King William-street, Strand.

**GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN RAILWAY SEED ESTABLISHMENT, READING, BERKS.**

# SUTTON'S COLLECTIONS OF KITCHEN GARDEN SEEDS,

**Carriage free to any Railway or Packet Office in London, Bristol, Oxford, Gloucester, Exeter, Southampton, Portsmouth, Dover, or to any other Station on the above-named Railways.**

The economy and other advantages of these collections have been fully appreciated by those who have purchased them in former seasons, as indicated by the numerous orders this year received through their recommendations.

**No. 1. A complete collection of Kitchen Garden Seeds, for a large Garden, for one year's supply £2 10 0**
**No. 2. A complete collection of ditto, in quantities proportionately reduced - - - - - - 1 10 0**
**No. 3. A complete collection of ditto, equally choice sorts - - - - - - - - - - - - 1 1 0**
**No. 4. A small and choice assortment of ditto - - - - - - - - - - - - - - 0 12 6**

*Persons who are already in possession of several kinds of Seeds, are requested to send the names, that they may be omitted in the collections they may order, and additional quantities of other sorts will be given in lieu of them.*

JOHN SUTTON AND SONS have the pleasure of presenting the following SELECT LIST OF SEEDS, which they consider the best in cultivation, *from which, and other sorts, they compose the above complete collections,* and purchasers having preference for any particular sorts, *whether contained in this list or not,* are requested to name them, and their wishes will be strictly attended to. *Any of the under-mentioned articles may also be purchased separately at the prices affixed,* and will be sent, carriage free, as above, except parcels under 10*s.* value.

Choice collections of FLOWER SEEDS may also be had, consisting either of the most showy *Hardy sorts only,* or in assortments of Hardy and Tender, including splendid German Asters, Stocks, Zinnias, Balsams, Marigolds, Hollyhocks, Wallflowers, &c., as under. *The best 50 sorts,* 10*s.* 6*d.*; *the best 36 sorts,* 7*s.* 6*d.*; *the best 24 sorts,* 5*s.*; these will be sent free by post, or, with the other Seeds, by railway.

## KITCHEN GARDEN, FLOWER GARDEN, AND FARM SEEDS.

Having various kinds of Land, situate in different localities, which we occupy for the purpose of GROWING SEEDS TRUE TO THEIR KINDS, and proving the comparative merits of each sort, we are enabled to supply our customers with Seeds of the best kinds in cultivation, and of such quality as to prevent disappointment.

In proving the germinating qualities of Seeds, we do not trust to experiments made under glass, but subject them also to the trial of open ground sowing; and when, on a recent occasion of considerable interest in the Seed Trade, one of our firm was subpœnaed to give evidence before Lord Chief Justice Campbell, and a Jury of Agriculturists, as to the most certain test of the vegetative properties of Seeds, his Lordship highly complimented us upon our system of conducting our business. [*See "Times" of July 22d, and other Daily Papers.*]

### KITCHEN GARDEN SEEDS.

#### Peas.

**The sorts of Peas now in cultivation being numerous, and almost every variety being a favourite in certain localities, we have found it necessary to keep a stock of very many sorts to enable us fully to execute the orders we are receiving from our customers in various parts of the United kingdom. Having, however, tested the comparative merits of each in our sample ground, we are enabled to recommend especially the undermentioned.**

10 fine early, medium, *s. d.* and late sorts, for succession, 1 quart of each 7 6
6 do. do., 1 quart of each 5 0

| Sutton's Superb White; possesses the valuable properties of the Paris White, and is larger | 1 6 |
| Sutton's Superb Green; splendid large close yellow hearts, crisp and sweet; requires no tying | 1 6 |
| Berkshire Brown, fine broad-leaved hearting | 1 6 |

*J. Sutton and Sons had the honour of supplying the Horticultural Society's Garden at Chiswick, with the above-named Lettuce seed, in Feb. 1849; and in March, 1850, the editor of the* Gardeners' Chronicle, *in a critique on Lettuces, says of the first of these:—*

"This is the very best Cos Lettuce, very large, light green, leaves hooded at the top, so that they close in without tying, blanching white, crisp, so excellent, that one would suppose no higher degree of perfection could be attained, as regards a summer Lettuce." *And of the other two, he further says,* "SUTTON'S SUPERB GREEN Cos: this very much resembles the preceding, but is of a darker green, and hardier, therefore is preferable for sowing early in spring, and also for autumn use; in warm, sheltered situations, it will stand the winter, if the latter prove mild. For the generality of winters, however, a hardier Cos is required; such is the following—SUTTON'S BERKSHIRE BROWN Cos: this is the best Cos for standing the winter; it is large, and of good quality, blanching very crisp; therefore its brown outside should not be considered objectionable."

RENÉ LANGELIER, of the Clarendon Nursery St. Helier, Jersey, begs to draw the attention of the Public to his still unrivalled collection of PEAR TREES, not yet surpassed in Europe, in which will be found all the very best varieties, insured for the season required. Trees may be had already formed, either pyramidal or for espalier, in unusually fine and healthy condition, such as will give the most ample satisfaction to both purchaser and R. L. The price has been much reduced, and the quantity of Trees R. L. possesses enables him to supply the trade with guaranteed sorts equal to any house on the Continent, having given the greatest satisfaction for several years. Foreign correspondents will find a very great advantage if the selection is left to R. L., as they will be cheaper, and none but the best sorts will be supplied.

R. L.'s Descriptive Catalogue, which has been found the best and most correct yet published, is only to be had at his Nursery, Jersey, price 1*s.* 6*d.* and 6*d.* extra for postage.

A very great reduction has been made in the transit by steamers to all parts of England, so that R. L. can supply Trees cheaper than any other grower.

A fine collection of Roses, Camellias, and yellow Picotees.

PRICED CATALOGUE OF KITCHEN-GARDEN SEEDS. PRICED CATALOGUE OF FLOWER SEEDS.

JOHN CATTELL'S Descriptive Catalogues of the above may be had on application; if by post, by enclosing a penny stamp for each. They contain the best kinds in cultivation, and their genuineness may be relied on.

Westerham, Kent.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem | 42*s.* to 60*s.* |
| Extra superior selected Standards | 18*s.* to 24*s.* |
| Fine Dwarfs and Dwarf Standards | 10*s.* to 16*s.* |
| Superb do. do. (for exhibition) | 18*s.* |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 | 50*s.* |
| Good do. do. without names, per 100 | 30*s.* |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

THE NEW EARLY SWEET-KERNELLED KAISHA APRICOT.

MESSRS. VEITCH AND SON feel much confidence in bringing into public notice the above valuable new Syrian Apricot, sent to this country by the late JOHN BARKER, Esq., of Suedia, the gentleman by whom the valuable Stanwick Nectarine was introduced. Having obtained the entire Stock, they are now prepared to send out a limited number of healthy Young Trees at the following prices, and solicit the favour of early orders, which will ensure good trees and meet with immediate attention:

Healthy one year old Trees ... 21*s.* 0*d.*
" one year trained ... 31 6 } package included.
" two year trained ... 42 0 }
A few two year old trained, chiefly half-standards and standards ... ... ... ... 42*s.* each.

One plant over to the Trade when three are taken.

In offering the above valuable new early Apricot for sale, Messrs. VEITCH and SON beg to refer to the description given by Dr. LINDLEY, in the "Journal of the London Horticultural Society" for July, 1849, from which the following extract is given:

"The fruit semi-transparent, roundish 5½ inches, in circumference, skin slightly downy, pale citron-coloured where shaded, tinged and marked with red next the sun. Flesh tender, juicy, of a clear citron colour, parting freely from the stone, *sugary and delicious*, like well refined lump sugar combined with Apricot flavour; stone *small*, roundish; kernel sweet like a nut. A valuable early variety for the dessert, and probably excellent for preserving; if it be employed for this purpose, the transparency of its flesh will exhibit a new feature amongst Apricot preserves. Some of the fruits have ripened as early as the 12th of July, and on the *same wall* at the time were Moorpark and Turkey Apricots perfectly green and hard."

Exeter, Feb. 1851.

PLANT DOUBLE ANEMONES AND RANUNCULUSES THIS MONTH.

CAREY TYSO, FLORIST and SEEDSMAN, Wallingford, Berks, can supply fine named ANEMONES at 3*s.* to 5*s.* per dozen, with full printed instructions for culture, for four labels. Choice named RANUNCULUSES, 5*s.* to 10*s.* per dozen. TYSO'S SUPERB SEEDLING ditto, 12*s.* to 18*s.* per dozen sorts. Treatise on Culture for eight labels.

Imported Seeds of the best quality: German Asters, Stocks, Salpiglossis, Balsams, Larkspurs, Poppies, Zinnias, 2*s.* 6*d.* per named assortment.

☞ All the above articles can be sent by post.

LARGE SURPLUS STOCK OF FOREST TREES, SHRUBS, &c., NOW ON SALE AT RENDLE'S NURSERY, PLYMOUTH. ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., PLYMOUTH, *have a large SURPLUS STOCK of the following TREES and SHRUBS; and as the ground is required for other purposes, they will be sold at the following low prices:*

*** CARRIAGE FREE (See below).

LARCH FIRS.—We have a very large stock of fine stuff, about 3 feet in height; the price will only be 18*s.* per 1000.

BERBERIS AQUIFOLIUM.—A large quantity of fine stuff, 18 inches, 16*s.* per 100. This is a fine Shrub for underwood.

SCOTCH FIR.—Large stock of fine stuff, 24 to 30 inches in height, 15*s.* per 1000.

PINUS AUSTRIACA.—We have an extensive stock of this valuable tree, of the finest possible growth, 12 to 18 inches, fine and stout, 35*s.* per 1000.

*** *This is a most excellent hardy Pine, being very superior to the Scotch Fir.*

PINEASTER.—18 inches, good stuff, 18*s.* per 1000. *First-rate Pine for the sea coast.*

ASH.—4 feet, 20*s.* per 1000.

BALM OF GILEAD.—3 to 4 feet, handsome species of Fir, 4*s.* per 100.

LILACS, 4 feet, 6*s* per dozen.

LAURESTINUS.—2 feet, busby, 6*s.* per dozen.

BAYS.—18 inches, 5*s* per dozen.

RHUBARB: MITCHELL'S ROYAL ALBERT, *the earliest of all.*—We have more than a thousand strong roots, 15*s.* per dozen.

RHUBARB: MYATT'S VICTORIA, very strong roots, 15*s.* per dozen; smaller ditto, 9*s.* per dozen.

RASPBERRIES: RENDLE'S LARGE BEEHIVE.—This is a large handsome variety, very prolific, delicious flavour, and has given the most complete satisfaction to all. Strong Canes, 20*s.* per 100; 3*s.* per dozen.

STRAWBERRIES: KITLEY'S GOLIAH, 3*s.* 6*d.* per dozen; 20*s.* per 100. CUTHILL'S BLACK PRINCE, 2*s.* per dozen; 10*s.* per 100.

SEAKALE AND ASPARAGUS in large quantities, very reasonable.

BLACK NAPLES CURRANTS, very superior to the old sort, 6*s.* per dozen.

CEDRUS DEODARA.—Fine stock of nice young seedling plants, two years old, in pots, 6*s* per dozen.

*Our Catalogue of Forest Trees, Shrubs, and Fruit Trees, can be obtained for one penny Stamp.*

All orders above 5*l.* will be delivered CARRIAGE FREE to any Station on the Great Western, Bristol and Exeter, or South Devon Railways; or to Cork, Dublin, or Belfast. Steamers from this port to Cork, Dublin, and Belfast twice a week.

*The South Devon Railway is now open to Plymouth; the Station being within one minute's walk from our Counting-house.*

All Orders will be executed in strict rotation.

*** We have a few fine Trained Yews for Hedge work, 3 to 4 feet in height, and will spread as much, 24*s.* per dozen.

WILLIAM E. RENDLE and Co., Nurserymen, Plymouth. Established 1786.

POLYANTHUS SEED.

JAMES WOODS has a quantity of Polyanthus Seed, which he can recommend with confidence, saved from none but named and good laced Flowers, price 1*s.* per packet; or sent free on receipt of 13 stamps. Also, a few hundreds of Ranunculus roots of the best old named varieties, in one mixture, at 5*s.* per 100.—Address to JAMES WOODS, Florist, Harwich, Essex.

SAMUEL FINNEY AND CO.'S CATALOGUE OF SEEDS, for 1851, is now ready, and may be had postage free, on application. It contains a Select List of all the most approved sorts of Culinary Vegetables in cultivation. Also an extensive collection of Flower Seeds, including the imported German kinds, with descriptions, stating the proper time for sowing, hardiness, duration, height, time of flowering, and the colour of each, with much other useful information. The collections of Seeds sent out last year by S. F. and Co. having given general satisfaction, they again offer them as under.

VEGETABLE SEEDS.—CARRIAGE FREE.

We prove the growth of each kind before we send them out.

| | | | |

THOS. RIVERS, the Nurseries, Sawbridgeworth, Herts.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENÉ LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN RAILWAY SEED ESTABLISHMENT, FOR SUPPLYING GENUINE HOME-GROWN SEEDS, CARRIAGE FREE.

SUTTON'S COLLECTIONS OF GARDEN SEEDS.

*For the convenience of Gentlemen who may not be well acquainted with all the best kinds of Garden Seeds, and the proper proportions of each generally necessary to stock a large or small Garden,* Messrs. SUTTON *have during the last seven years been in the practice of making complete Collections for one year's supply, the economy and other advantages of which system have been fully appreciated by the purchasers, as indicated by numerous recommendations and annual increase of orders.*

| | £ *s. d.* |
|---|---|
| No. 1. A COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS FOR A LARGE GARDEN, for one year's supply ... ... ... ... ... ... | 2 10 0 |
| No. 2. A COMPLETE COLLECTION OF DITTO, in quantities proportionately reduced ... ... ... | 1 10 0 |
| No. 3. A COMPLETE COLLECTION OF DITTO, equally choice sorts ... ... ... ... | 1 1 0 |
| No. 4. A SMALL AND CHOICE ASSORTMENT OF DITTO ... ... ... ... ... ... ... | 0 12 6 |

PERSONS who are already in possession of several kinds of Seeds are requested to send the names, that they may be omitted in the collections they may order, and additional quantities of other sorts will be given in lieu of them.

*For particulars of the sorts contained in these Collections, see Advertisement on the last page of the* Gardeners' Chronicle, *of January 25.*

JOHN SUTTON and SONS are also extensive growers of early Potatoes, and Agricultural Seeds, particulars of which may be had by post.

*Reading Seed Warehouse, Reading, Berks.*

SUPERB RANUNCULI.—The present being the usual month for planting the Ranunculus, we beg to recommend the following selections.

*The new varieties have been selected with great care, of first-rate sorts, from immense quantities of seedlings, and for vigorous growth and free flowering are far preferable to the older varieties. Selections, in strong roots, at the following reasonable charges, with printed instructions for planting and treatment.*

| RANUNCULUS.—*Free by post.* | £ *s. d.* |

Copies of our Autumn Root Catalogue may still be had.

Remittances required from unknown correspondents.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

DOUBLE ITALIAN TUBEROSE ROOTS.—The Bulbs of this most beautiful and fragrant Flower have been just received from Italy, at A. COBBETT'S Old-established Italian Warehouse, 18, Pall-mall; they are warranted double, and large and choice roots of which are selected at 4s. per dozen. N.B.—Orders by post punctually attended to.

AN UNLIMITED STOCK OF REMARKABLY FINE SEEDLING AND TRANSPLANTED LARCHES AT REDUCED PRICES.

WM. WOOD AND SON, being very extensive holders of the above, and all other kinds of seedling and transplanted Forest trees, will be happy to furnish prices on application.

N.B. Catalogues of Vegetable, Flower, and Agricultural Seeds, also of Nursery Stock, will be forwarded free.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

SEEDS OF THE BEST QUALITY, CARRIAGE FREE.

J. C. WHEELER AND SON have had the honour of being appointed Seedsmen to the Gloucestershire Agricultural Association. Their Priced List of Seeds for this season is just ready, and will be forwarded free by post to any address on receipt of two postage stamps. This Catalogue is not a long list of useless names; it is really what it professes to be, a List of the best Seeds in cultivation, and will be found a safe guide to all purchasers.

Dr. LINDLEY, in the *Gardeners' Chronicle*, of the 2d March last, strongly recommends it in the following terms:

"THE CATALOGUE OF SEEDS SOLD BY J. C. WHEELER AND CO., GLOUCESTER, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless, incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."

J. C. WHEELER and SON deliver their Seeds CARRIAGE FREE.

Kingsholm Nursery; and 99, Northgate-street, Gloucester.

RETAIL SEED LIST—1851.

ABRAHAM HARDY AND SON, SEED GROWERS, Maldon, Essex, in returning thanks to their numerous patrons and friends for past favours, beg again to offer their priced Catalogue of Floral, Vegetable, and Agricultural Seeds; also of Early Seed Potatoes, free to any address, on application; or, with a packet of either superior summer Lettuce, Double Parsley, Mignonette, Nemophilas, Eschscholtzias, German Asters, Larkspurs, or Sweet Williams, for two penny stamps.

MESSRS. STANDISH AND NOBLE have to offer the following very desirable plants:

AZALEA INDICA, "GLORY OF SUNNING-HILL."—In general appearance this plant, when in bloom, reminds one of Nerium splendens, producing large double rose-like flowers of the richest pink; good plants, 3s. 6d. to 10s. 6d. each.

CRYPTOMERIA JAPONICA SEEDLINGS.

2 years ... ... ... ... 18s. per doz., or 105s. per 100.
3 years ... ... ... ... 30s. ,, 210s. ,,
1 foot 6 inches to 2 feet 6 inches high, 60s. per dozen.
2 feet 6 inches to 3 feet 6 inches high, 90s. ,,
3 feet 6 inches to 4 feet 6 inches high, 126s. ,,
And larger plants in proportion.

The whole of the above, with the exception of the two years seedlings, were planted into the open border last spring, are fine robust specimens, and fit for immediate planting.

CRYPTOMERIA JAPONICA, var. NANA, a very singular dwarf variety, 10s. 6d. to 21s.

CUPRESSUS FUNEBRIS, or WEEPING CYPRESS, (North of China.)

6 inches high, 10s. 6d. each; 12 to 15 inches, 21s. each.

These plants are from the open border—robust specimens fit for immediate planting.

15 ins. to 24 ins., 31s. 6d. each; 24 ins. to 30 ins., 42s. each.

CUPRESSUS GOVENIANA. (California.)

6 to 9 inches, 7s. 6d. each; 9 to 15 inches, 10s. 6d. each.
15 to 24 inches, 21s. each; 2 to 3 feet, 31s. 6d.

CUPRESSUS LAMBERTIANA, 2 feet, 3s. 6d. each.

CUPRESSUS THURIFERA, var. ELEGANS, perfectly hardy. 1 foot to 2 feet high, 3s. 6d. to 5s. each.

CEPHALOTAXUS FORTUNII, strong plants, 31s. 6d. each. For description, see "Botanical Magazine," by Sir W. Hooker.

FORSYTHIA VIRIDISSIMA.

1 foot 6 inches to 2 feet ... ... 1s. 6d. to 2s. 0d. each.
2 feet to 3 feet ... ... ... ,, 2s. 6d. ,,
3 feet to 4 feet ... ... ... 3s. 6d. ,, 5s. 0d. ,,

Fine bushy plants from open border fit for immediate planting.

JASMINUM NUDIFLORUM ... ... 1s. 6d. each.

Flowering plants ... ... ... ... 3s. 6d. ,,

This is a very desirable winter flowering hardy plant, producing a profusion of flowers of the richest yellow from December to February.

QUERCUS SCLEROPHYLLA. (North of China.) This is undoubtedly the most remarkable of all evergreen Oaks, having foliage as large as the Spanish Chestnut, and more than twice the substance. Strong seedling plants, 42s. each.

QUERCUS INVERSA. (North of China) Also evergreen, with smooth entire leaves, having remarkably large male inflorescence. Seedlings, 42s.

FORTUNE'S YELLOW ROSE, a distinct species, admired by all who have seen it. It would be impossible to describe the combination or richness of the bronze and yellow tints which the flowers present. It is an excellent pillar Rose, and its foliage is distinct. It blooms freely, and in general habit resembles Ruga. Dwarfs, 5s.; Standards, 10s. 6d. each.

TAXODIUM SEMPERVIRENS.

1 foot to 1 foot 5 inches ... ... 2s. to 2s. 6d. each.
1 foot 6 inches to 2 feet 6 inches ... 3s. 6d. to 5s. ,,
3 to 4 feet ... ... ... ... 7s. 6d. to 10s. 6d. ,,
Larger in proportion.

VIBURNUM PLICATUM. (North of China). A noble shrub, producing in great profusion large globular heads of flowers of the purest white. Strong plants, 21s. each.

WEIGELA ROSEA.

6 inches high ... ... ... ... 1s. 0d. each.
1 foot to 1 foot 6 inches ... ... 1s. 6d to 2s. 6d. each
1 foot 6 inches to 2 feet ... ... 3s. 6d. to 5s. 0d. ,,
These last are fine bushy flowering plants.

Selections of the finest Autumnal Flowering Roses.

Standards ... ... ... ... 15s. 0d. per dozen.
Half Standards ... ... ... 12s. 0d. ,,

N.B.—We have a large quantity of very fine common Laurels, from 2 feet to 6 feet high; also Spruce Fir, from 2 feet to 4 feet high; which can be sold very cheap, particulars of which can be had on application.

Bagshot Nursery, Feb. 1.

PEARS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, Clarendon Nursery, St. Helier, Jersey, Channel Islands, begs to offer the following new PEARS, of the first merit:

BEURRE CLAIREGEAU, bearing the name of the raiser of this valuable Pear.—A very large fruit, perfectly melting, and a late fruit of first merit. Price 5s.

BEURRE D'HIVER.—Also large, and keeps till April, perfectly melting, hardy, and great bearer. Price 5s.

BEURRE NANTAIS.—The earliest Pear known, excellent, and great bearer. Price 2s. 6d.

The above R. L. can strongly recommend. None will be forwarded to unknown correspondents except on the receipt of cash or reference.

PEAR AND QUINCE STOCKS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, St. Helier, Jersey, begs to inform the Public and the Trade that he has the following, of very superior growth, to dispose of:—A few thousands QUINCE, very free and healthy, fit to receive the buds next July, at 40s. per 1000; also PEAR Stocks, of superior growth, two years transplanted, and very vigorous, at 40s. per 1000; smaller ditto, transplanted, and very vigorous, at 35s. per 1000.

This is an opportunity R. L. has never before offered to the Public, for his stock is totally different from the French stock, which has always given R. L. superior growth of trees.—Orders will be punctually attended to. Reference or remittance from unknown correspondents.

FRUIT TREES.—The SUBSCRIBER having obtained near London, and planted in Essex, the 2000 FRUIT TREES advertised for in November last, is prepared to entertain further offers during the summer for the supply of several thousands more of APPLE and PEAR trees suitable for open Orchard planting next season. Age not to exceed two years grafts last spring. Also are wanted a few thousands of CRAB STOCKS and PEAR STOCKS.—Address particulars to D. MORRIN, Esq., 2, Chapel-terrace, near Kensington Gardens, Bayswater, near London.

TO BE DISPOSED OF, by an AMATEUR GARDENER, about 200 GOOSEBERRY BUSHES, in nearly 100 varieties, comprising the newest and finest prize sorts that have been raised—a great many standards and half-standards, root pruned. About 100 Prize CURRANT TREES, in 20 distinct varieties. About 20 varieties of STRAWBERRIES, of Black Prince alone nearly 1000 fine plants. About 100 pyramidal APPLE, PEAR, PLUM, and CHERRY TREES, selected from Mr. Rivers's collection at Sawbridgeworth; also a number of Rivers's double-bearing RASPBERRY. Likewise a fine collection of Ferns, Rock Plants, Hollyhocks, and Herbaceous Plants.

Any Gentleman forming an establishment, or wishing to improve his present collection, will find this an opportunity rarely offered, as likewise many country Nurserymen.—Can be seen at an easy distance of one hour's ride from London. Apply to DUNCAN HAIRS, Seedsman, 109, St. Martin's-lane, London.

DALSTON NURSERY, MIDDLESEX. — All Persons having any Claims against the Estate of Mr. JOHN SMITH, late of Dalston Nursery, deceased, are requested to forward the particulars thereof, addressed to Mr. THOMAS SMITH, at the Nursery, without delay; and all Persons indebted to the Estate are requested to pay the same either to Messrs. GRAHAM and LOYDE, Solicitors, 3, Mitre-court Chambers, Temple, London; or to Mr. WILLIAM HARRINGTON, at the Nursery.

SEED POTATOES, TRUE AND SOUND.

JOHN SUTTON AND SONS, SEED GROWERS, Reading, Berks, strongly recommend the above sorts of Potatoes, which they will send at the above low prices, carriage free, as see their Advertisement in the last page of *Gardeners' Chronicle* of January 25.

CUCUMBER—"PHENOMENA."

EDWARD TILEY begs to offer to Cucumber-growers generally the above superb CUCUMBER, which he feels confident will give the greatest satisfaction to them, as did the former kinds sent out by him during the last seven years, being Victory of Bath, Gordon's White Spine, and Lord Keynon's Favourite.

The above splendid Cucumber, "Phenomena," was a hybrid between Hamilton's Black Spine and Mills's Jewess, which it surpasses, both for its prolific qualities and length of fruit, generally growing from 22 to 28 inches. It is a beautiful black spine, of a dark green colour, and free from ribs or shrivels; it also grows quickly, carries its bloom well, and will be found first-rate for exhibition. As a proof of its prolific qualities and length, the following may be vouched for, viz.:—There were cut from two plants, grown in a one-light box, the size of which was 4 feet by 6, 24 brace of Cucumbers, each fruit averaging 22 inches long—total length of the whole amounting to 29 yards 1 foot. It is solid, and eats very crisp. Sold in packets containing seven seeds, 5s.; or three seeds, 2s. 6d.

E. T. has also seed of his three other superb Cucumbers at the following prices:

Victory of Bath, per packet ... ... ... 2s. 0d.
Gordon's White Spine, ditto ... ... ... 1 6
Lord Keynon's Favourite, ditto ... ... 2 6

This last is the best for winter cultivation.

MELONS.

BROMHAM HALL GREEN-FLESH MELON.—This has again this season surpassed all others for its superior flavour; it was placed first and second for flavour at the Chiswick Exhibition last season, and obtained a great number of first prizes throughout the country where exhibited. Sold in packets at 1s. 6d. each.

E. T. has also seeds of the following superb Melons, which he can with confidence recommend:

| | | |
|---|---|---|
| Camerton Court Green-flesh ... ... | 1s. 0d. | per packet |
| Queen Melon ... ... ... ... ... | 1 0 | ,, |
| Blackall's Green-flesh ... ... ... | 1 0 | ,, |
| Bailey's Green-flesh... ... ... ... | 1 0 | ,, |
| Bowood Green-flesh... ... ... ... | 1 0 | ,, |
| Beechwood Green-flesh ... ... ... | 1 0 | ,, |
| Windsor Prize ditto... ... ... ... | 1 0 | ,, |
| Emperor ... ... ... ... ... | 1 0 | ,, |
| Fleming's Trentham Hybrid ... ... | 1 0 | ,, |
| Duncan's Green-flesh do. Improved ... | 1 0 | ,, |
| Hampton Court Green-flesh ... ... | 1 0 | ,, |
| Egyptian do. do. Improved ... ... | 1 0 | ,, |

Any quantity of the above will be sent postage free to any part on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

CHEAP PLANTING.

LUCOMBE, PINCE, AND Co. have a large quantity of fine LARCH, SPRUCE FIR, THORNS for Hedges, LAUREL, LAURESTINUS, PORTUGAL LAUREL, &c., all of very superior quality, of various sizes, which, owing to the Lease of one of their Nurseries on which they now grow expiring at Lady-Day next, will be sold at greatly reduced prices.—For particulars of size and prices, apply to the Exeter Nursery, Exeter.

TREES.—WANTED for Plantation Planting, good well-rooted transplanted TREES. State price; delivered carriage and package paid to Bishop's Stortford Station, on the Eastern Counties Railway.—Address W. W., Dunmow, Essex. Horse Chestnut (common and Scarlet), Copper Beech, Common Beech, Turkey Oak, Elm, Birch, Alder, Weeping Willow, Sycamore, Lombardy Poplar, Mountain Ash, Hornbeam, Acacia, Balsam, Poplar, Lime, Aspen, not under 5 feet; Spruce, Larch, Scotch, Silver Fir and Austriaca, Hemlock Spruce, not under 3 feet; Laurels, 18 inches to 2 feet; Portugal ditto; five years old Quick, three times transplanted; Standard Apples and Pears, fruiting size; Thorn Acacia, 15 to 20 feet high; Specimen Trees, three years old, in pots; Stone Pines, Nigrans, Deodara, Weymouth, Laricio, Cembra, Erecta, Erectum, Siberia, Picea Pinsapo, Picea Taxifolia, Pinus Macrophylla, Insignis, Douglasii, Lambertiana, Imbricata, and Gerardiana.

THE BLACK AUSTRIAN PINE.—"PINUS AUSTRIACA."

LUCOMBE, PINCE, and Co. have a large and healthy stock of this most desirable Pine, exceeding 300,000, from 9 inches to 3 feet high, which having been frequently transplanted, are well rooted and safe to remove, they can offer them, varying according to age and quality, from 20s., 40s., to 60s. per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils; growing rapidly and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds.

Exeter Nursery, Feb. 1, 1851.

NEW KITCHEN GARDEN SEEDS.—Warranted Excellent quality. Carriage Free! (See below).

| | | £ | s. | d. |

*A List of the kinds furnished in the above collections will be found in our* PRICE CURRENT AND GARDEN DIRECTORY, *which can still be had on application.—See* Gardeners' Chronicle, *Jan.* 4, 1851, *back page.*

*** All Seed Orders above 2*l.* delivered Free of Carriage to any Station on the Great Western, Bristol and Exeter, or South Devon Railways; or to Cork, Dublin, or Belfast, by steamers.

Apply to WILLIAM E. RENDLE & Co.,
Seed Merchants Plymouth.

N.B.—All the New Vegetable and Flower Seeds advertised from time to time in this Paper can be obtained from us, at the regular current prices.

HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENTS, MAIDSTONE, AND ADJOINING THE SOUTH-EASTERN RAILWAY STATION, ASHFORD.

WM. JAS. EPPS begs to state that he has taken the Nursery and Seed-growing business late in the occupation of Mr. James Cutbush, Sen., adjoining the Railway Station, Ashford, where he is making extensive alterations for carrying on the above business, in conjunction with his Nursery and Seed Establishment, Maidstone. The proximity of the Ashford business to the Romney Marsh (which is the largest and by far the best seed-growing district in the kingdom), will enable him to offer many advantages; great attention will be paid in selecting and growing the stocks true to their kind. He is now prepared to receive commissions from any respectable wholesale house. The prices, per contract, this year are exceedingly low, and any further information upon this subject may be had upon application, also his wholesale and retail List of Seeds.

W. J. E. has a large and splendid stock of the following Seeds, which he can warrant to any extent, and at very low prices—terms, three months, upon satisfactory reference—Skirving's Purple-top Swede, Laing's Purple-top Swede, Mangold Wurzel, White Carrot, Parsnip, Champion of England Peas, Imperial, Victoria Marrow, Blue Prussian, Broccoli, and Cabbages of sorts; Kohl Rabi and Mustard. All seeds carriage paid to London.—Feb. 1.

SPLENDID NEW HARDY DIANTHUS.—"DIANTHUS REIDII."

J. REID begs to state that he has succeeded in saving a small quantity of the seed of his new Dianthus. The flower of this magnificent plant is from 3 to 4 inches in diameter, the colour is bright scarlet, laced with white. From the middle of May till the end of August this gem of the flower-garden is perhaps without a rival. J. R. is also sending out a small quantity of choice Polyanthus seed, which he can with confidence recommend.

Dianthus seed, 1s. per packet. Polyanthus seed, 6d. per packet. On the receipt of penny postage stamps to the amount, one or both will be sent free to any part.

J. REID, Seedsman, &c.

Richmond-street, Weston-Super-Mare, Somerset.

J. G. WAITE'S CATALOGUE OF VEGETABLE SEEDS is now Ready, with Prices to suit the times, and can be had on application.

181, High Holborn, London.

J. G. WAITE'S CATALOGUE OF FLOWER SEEDS is also Ready, and can be had on application.

181, High Holborn, London.

SION-HOUSE DWARF FRENCH BEAN, new, early, buff speckled. This is the earliest Bean known, and can be had in any quantity, price 21s. per bushel.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London, where every other kind of Seed in cultivation can be had, on better terms than at any other House in the Trade.

RHUBARB ROOTS TRUE TO NAME.—Myatt's Victoria, 6s. per doz; Myatt's Linnæus, 9s. per doz.; Mitchell's Albert, 9s. per doz.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

STRAWBERRY PLANTS.—Ridley's Goliah, 10s. per 100; Myatt's Eleanor, 4s. per 100.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

NEW GIANT ASPARAGUS PLANTS, 5s. per 100. LARGE GIANT SEAKALE PLANTS, 8s. per 100.

At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

TO BE SOLD, a decided bargain, about 100 Standard PEAR TREES, seven years old, in a bearing state; the present being the most appropriate season for Transplanting and Root pruning. Having been carefully attended to, will move with great certainty. Also, two Greenhouses, 35 feet by 12 feet each, in excellent repair.—Direct to THOMAS STACEY, Florist, near the Station, Church-street, Hackney, near London.

HEATHS AND OTHER PLANTS FOR EXHIBITION.

WILLIAM JAMES EPPS begs to state that he has for sale the finest Stock of Young HEATHS and other Greenhouse and Stove Plants possible, which will make splendid specimens in a short time. The superior character of Plants sent out from this Establishment is justly admitted by all who have purchased. The magnificent specimens of Heaths, &c., exhibited by him last season at the Exhibitions at Chiswick and the Royal Botanic Gardens, London, where he received the highest awards, fully justify the foregoing remarks.

Strong bushy Plants can be had at the following low prices, exclusive of packing, carriage paid to London:

| | £ | s. | d. | | £ | s. | d. |
|---|---|---|---|---|---|---|---|
| 100 fine varieties of Heaths ... ... | 5 | 0 | 0 | 100 fine vars. of Stove and Greenhouse Plants ... ... | 5 | 0 | 0 |
| 50 ditto ditto | 2 | 12 | 6 | 50 ditto ditto | 2 | 12 | 6 |
| 25 ditto ditto | 1 | 10 | 0 | 25 ditto ditto | 1 | 10 | 0 |
| 100, including all the finest varieties of ditto ... ... ... | 7 | 10 | 0 | 100 newest and finest vars. of ditto ... | 7 | 10 | 0 |
| 50 ditto ditto | 4 | 0 | 0 | 50 ditto ditto | 4 | 0 | 0 |
| 25 ditto ditto | 2 | 2 | 0 | 25 ditto ditto | 2 | 2 | 0 |

All the new leading kinds of Geraniums and Cinerarias 12*s.* to 21*s.* per doz.

Catalogues of the above may be had on application.

Bower Nurseries, Maidstone.—Feb. 1.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2½ feet, is three weeks earlier than the old dwarf Green Knight's, and the Peas and pods are twice the size. 5*s.* per quart.

BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetars, and 20 to 24 per stem. 1*s.* per quart.

BURBIGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1*s.* per quart.

The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c., Wholesale and Retail, 109, St. Martin's-lane, Charing-cross, London.

Catalogues can be furnished on application.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE OF SEEDS is now ready, being a part of their ANNUAL SEED AND PLANT LIST, which will shortly be complete, and forwarded as a newspaper, free by post. The Parts now ready may be had together for a penny stamp, viz.:

PART I. FLOWER SEEDS, containing a scale of priced selections of 422 of the new and most approved sorts, with colour, height, hardiness, duration, price of each packet, and other useful information.

PART II. VEGETABLE SEEDS, with priced scale of collections, time of sowing each description of Vegetable, and price of each variety, with heights of Peas, and other descriptive information.

PART III. AGRICULTURAL SEEDS, containing also much useful and descriptive information.

PART IV. ROOTS, FRUITS, AND BULBS for early planting.

PART V., as far as complete, contains a scale of prices of our choice selections of plants, and the principal part of our descriptive list of Geraniums.

Seed and Horticultural Establishment, Sudbury, Suffolk.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY, UNDER THE PATRONAGE OF HER MOST GRACIOUS MAJESTY, THE QUEEN. The Exhibitions for the present season will take place as follows. The first on WEDNESDAY, April 23, 1851, in the Assembly Rooms, at the HORNS TAVERN, Kennington, and the following at the ROYAL SURREY ZOOLOGICAL GARDENS; on

WEDNESDAY, May 28th,
WEDNESDAY, June 25th,
THURSDAY, July 24th, and
WEDNESDAY, Sept. 3d.

List of Prizes, and the Rules of the Society, may be obtained from JOHN TAYLOR NEVILLE, Secretary, Ebenezer House, Peckham, Surrey.

Subscriptions, 20*s.* per annum, entitling each Member to the privilege of attending all Flower Shows, Lectures, and Meetings of the Society, of Exhibiting Flowers, Fruit, and Plants, their own growth, in competition for Prizes, without any charge for entry; and, also, to have two Free Admissions for Friends, at each Flower Show, Lecture, or Meeting.

WE owe to the kindness of a correspondent at Wexford the knowledge of the following very curious case of SIAMESE GRAFTING. Two Carrots, white and red, came into contact in the progress of their growth, and united; with this peculiar feature, that each assumed the characteristics of the other.

In a communication from Mr. EDWARD CARROLL, of Beg Erin, near Castlebridge, we gather the following additional particulars. These Carrots were grown together on the farm of JOHN LEARD, Esq., at Carrick Hill, from a mixed sample of seeds of the *White Belgian* and *Red Surrey*. The two roots grew so close to each other that each twisted half round the other, and they became united. The most singular matter was that the red Carrot with its small overgrown part above the junction took the colour and large dimensions of the white Belgian, which in like manner, with its larger head above the joining, took the colour and small dimensions of the red one at and below the union.

We are acquainted with no similar case. Turnips occasionally grow together; we have seen a root of that plant half yellow and half white, apparently in consequence of two young roots having been pressed together and compelled to unite when very young into one solid body; but in such cases each half retains its peculiar quality. In the present instance the roots only join by a narrow neck, the upper and lower portions remaining perfectly separate; and yet, strange to say, each gives its companion its own qualities, and receives in return other qualities belonging to its twin. Not, however, wholly, but in part; to use familiar language, the white-headed Belgian gives its red companion a white tail, while the carrotty-headed Surrey gives the Belgian a red tail.

Mr. CARROLL points out how much this case serves to confirm the theory of descending sap. Not that the theory stands in need of confirmation, for no one really familiar with living plants can have any doubt of it; but the present case seems to admit of no possible explanation upon any other principle. The Carrot *b d*, is joined to *a c*, at the point *e*, where each is thrown out of the perpendicular into nearly a horizontal position for a short space, after which each again resumes the perpendicular. The effect of this is, that the two Carrots continue to represent two perpendicular lines, but each perpendicular consists of two parts, the upper belonging to one Carrot, and the lower to another. It is evident that the red sap of *b*, when it reaches *e*, where an obstruction occurs, will more readily find its way to *c* than to *d*; and in like manner the white sap of *a*, impeded by the obstruction *e*, will more readily find its way to *d* than to *c*, to which, under ordinary circumstances, it would have proceeded; and thus the respective qualities of the two roots become transposed.

The heads of the two remain unaffected by the union; for there everything remains in its natural state, acted upon by the foliage, as is usual; but below the junction a great alteration is produced. The tail *e d*, naturally weak, is distended by the abundant matter poured into it by its new head *a e*; and, in like manner, the tail *e c*, naturally vigorous, is starved by the insufficient food derived from its new head *b e*, and becomes diminutive and shrunken. This seems to have been remarkably the case in the specimen itself, but is not so apparent in our diminished figure.

Now arises the question, what sort of plant will come from the seed to be produced by these twins. We trust that their possessor will save the seed of each separately; and let us know the result when it shall have produced a future crop. It is not altogether impossible that the red Carrot may produce red seed, in spite of its white tail; and *vice versâ*. But the probability seems to be that the seed will have properties somewhat intermediate between the two.

---

A FORTNIGHT ago we briefly mentioned M. GARREAU'S very curious experiments on the perspiration of plants; we shall now redeem the promise we then gave, by describing his experiments more in detail, so that our readers may be in a position to judge for themselves of the value of his conclusions. M. GARREAU'S object in the first place was to ascertain the ratio in which the cuticle and covering membrane of plants is able to absorb or give out gaseous matters, what differences exist between the same membrane on the various parts of a given plant, and how these differences are modified by circumstances. The first series of experiments were made to measure the real porosity of the epidermis, by ascertaining the rate at which endosmosis takes place through it, between various dissimilar fluids. Small portions of the epidermis of different plants, carefully prepared, were cemented at the end of glass tubes; a weak solution of sugar was then poured into the tube, the lower end of which was thus closed by the film of vegetable membrane, and the tube was then immersed for a given number of hours in some other liquid, after which the quantity of the latter drawn through the membranes by endosmosis, was carefully measured.

The result of these experiments showed that the epidermis of old leaves permitted little or no endosmosis, whilst that of young leaves allowed it to a very sensible degree; a fact apparently caused by the considerable quantity of oleaginous matter, which covers and impregnates the epidermis of the former. On comparing together the epidermis taken from different parts of the same leaf, it was found that it varied considerably in its relation to this passage of fluid; the epidermis of the nerves, and of the lower part of the leaves, nearest to the leaf-stalk, being those which permitted it most freely. An epidermis, which does not allow of endosmosis in its natural state, becomes permeable to liquids, when it has been washed with ether, solution of soap, or in some cases even with distilled water alone. These effects are quite independent of the action of the stomata, and may be observed quite as well with a membrane wholly destitute of those openings. The fact that the epidermis of leaves will not permit the passage of water in their natural state, but will do so when the greasy matter which coats their surfaces is artificially removed, may be proved by immersing a faded leaf for some hours in water, keeping the whole of the leaf-stalk out of the fluid, it will absorb little or no water; but if it has been previously carefully washed with soap in distilled water, it will then be able to absorb a very notable quantity of the water in which it is subsequently immersed. This absorption is found to be quite as great in those leaves which are furnished with very few stomata, as it is in those which have many, provided the washing be carefully conducted, and all pressure avoided, which would cause the forcible introduction of water through the stomata.

The chief conclusions to which M. GARREAU arrives, as the results of these and a number of similar experiments, are as follows:—Firstly, That the cuticle of plants possesses the power of allowing endosmosis to take place whilst the parts are young, but that it loses it as they grow old. Secondly, that this power is in proportion to the quantity of oleaginous matter which exists in the cuticle, being greatest in those membranes which contain least fatty matter, or in which it has been artificially removed by washing. Thirdly, that the cuticle which covers the upper surface of the nerves, and particularly that which clothes the axillary part of the leaf-stalk, is that which permits the most abundant endosmosis. Fourthly, that the epidermis sometimes interferes with this power of the cuticle, because plants which have no epidermis permit endosmosis to a remarkable extent; and young bark which has this organ, permits much less endosmosis than that which is without it: and lastly, that if simple washing with distilled water is able to increase the absorbent power of leaves, it is plain that rain water must produce the same effect.

These results are certainly highly interesting, and unquestionably point to a new and hitherto unsuspected office of rain; they show the importance of keeping the surface of plants clean, and lead to numerous useful hints to the practical gardener. We must, however, confess that we do not feel altogether satisfied with some of the experiments, because we are not quite sure that it is fair to compare the endosmosis or passage of water through a membrane, with the gaseous transpiration which would occur through the same membrane; because the conditions most favourable to the one are not necessarily also always those best suited to the other. The experiments of the author do not bear upon this question; he merely shows that such vegetable tissue is really permeable to carbonic acid, but does not by direct experiment prove that this permeability is increased in any definite ratio by washing. The author endeavours to prove that carbonic acid gas is able to pass through the cuticle of plants which have no stomata, by referring to the growth of water-plants, which are without them; and by an experiment in which a portion of lime-water was enclosed in a tube, the end of which was covered with a small piece of such a membrane, and the tube then plunged for some hours in an atmosphere of carbonic acid; under

these circumstances the gas penetrated the membrane and rendered the lime-water turbid. This experiment, however, is by no means quite unexceptionable, because the question is not whether pure carbonic acid will pass through the membrane and mix with common air on the other side, but rather whether common air, containing 1 per cent. of carbonic acid, will so pass through to mix with air containing no carbonic acid. It is evident that the gradual filling up of the pores with oleaginous or resinous matter, which destroys the power of permitting endosmosis, does not necessarily also prevent the cuticle from absorbing carbonic acid; and indeed M. Garreau says this himself, for he observes that a cuticle which has lost the power of transmitting water, may still be permeable to that gas.

The second division of the paper contains a very valuable and careful series of experiments on the evaporation of water from the two surfaces of the leaf, and on the emission of carbonic acid gas from leaves. In those experiments leaves growing on healthy plants were selected, and a circular portion inclosed between two closely fitting glass receivers, so arranged that the leaf formed the division between the two glasses—the upper surface was in the one glass, whilst the under surface of the leaf was in the other glass. The quantity of moisture given off was ascertained by placing in each glass a weighed portion of dry chloride of calcium, which being hygroscopic, or very greedy of moisture, would absorb all the vapour as fast as the surface of the leaves gave it out. The result of these experiments is that the lower surface of the leaves gives off, from an equal quantity, three times as much as the upper surface does; sometimes the proportion is as high as five to one; and the ratio is quite independent of the position of the leaf itself. This exhalation of water has some connection with the number and size of the stomata, but is by no means wholly dependent on it, as there is evidently a large quantity of water given off independently of them. The evaporation is most abundant along the course of the nerves, and in those parts of the epidermis, on which there is the least quantity of oily matter.

As by the experiments already mentioned it has been shown that the transmission of water is greatly checked by the accumulation of oil and resin in the epidermis, it might naturally be expected that the perspiration or evaporation of water would likewise be diminished by the same cause. The experiments made with a view of ascertaining the correctness of this supposition, consisted chiefly in exposing leaves of different plants, the exact weight of which is known, to the air, and by subsequently weighing them again, observing the quantity of water which they had lost, and consequently the rate at which they were able to give off water. It was found in every case that cleansing, or washing the leaves with soap and water, increased their power of evaporation to a very considerable extent.

The emission of carbonic acid by the leaves of plants, under certain conditions, was first ascertained by Saussure, but since his first experiments, made half a century ago, no one has attempted to measure exactly the quantity of this gas which leaves give out; the careful and exact experiments of M. Garreau on this point are, therefore, of great value. He employed the same sort of apparatus for this purpose, which has already been mentioned, as being used in estimating the evaporation of moisture from the upper and lower surfaces of leaves, namely, two circular glass vessels, which being applied respectively to the upper and under sides of the leaf, enclosed a circular disk of the leaf between them, in a way very convenient for the purposes of the observer. In these experiments, however, in place of using dried chloride of calcium, a portion of lime-water was used, and the chalk formed in it by the absorption of carbonic acid subsequently weighed. The general results of these experiments are, that in the shade or diffused daylight, no carbonic acid is evolved by the leaves; that in the night it is given out by both surfaces, but in greater quantity from the lower than from the upper surface; and that when exposed to the influence of a very bright and hot sunshine, so that the rate of evaporation is very rapid, carbonic acid is likewise given off. In the latter case, the quantity of the gas thus evolved is comparatively small, and by far the larger portion of it is given off by the lower surface of the leaves. It also appears that the proportion of carbonic acid given off by different leaves, bears a closer relation to the number and size of the stomata than the proportion of water which the leaves are able to evaporate does.

All these experiments of M. Garreau teach us this fact, that under ordinary circumstances the growth of a plant causes the formation and deposition of certain substances, which in time fill up its pores, check perspiration, and consequently interfere with the nourishment and further growth of the plant. On the one hand, there can be little doubt that in very hot weather these matters must sometimes be useful in checking extreme perspiration, and in diminishing for the time the powers of the plant to absorb too much food from the air, or to part with water and carbonic acid too rapidly. On the other hand, the effect of rain must be to wash away a portion of these deposits, and so to favour the perspiration and consequent growth of the plant. Lastly, as the more heat a plant is exposed to, the more it perspires, and the faster it grows, the greater will the tendency be to fill up its pores; so it follows that when plants are exposed to great heat in a close house, and not in any way artificially washed or syringed, they are placed in an unnatural condition, and the very care of the gardener defeats, to some extent, the object which he has in view.

## MARKET GARDENING ROUND LONDON.

No. V. Leeks.—These are sown in February or early in March, in rich ground. When the plants are strong, and about 10 inches high, they are planted or dropped into holes 8 inches deep, made by the dibber. After they are planted, hoes are sent through them, to loosen the ground. In this operation mould drops down upon the roots, and the next hoeing fills the holes up loosely, which is what is wanted, for the soil must not be pressed tightly round the stem, as that would prevent its thickening.

White Cos Lettuce.—This variety is grown by the million, and is highly esteemed by every body. The seed is sown from the 10th to the middle of October, in frames, which are filled with soil to within 6 inches of the top, giving a slope of one foot in four, the length of the lights, which always face the north. As soon as the seeds are sown the sashes are removed, and a man is placed in this department, to keep off the sparrows, give air, and shut up in case of rain; the great secret being to keep them as dry as possible, and to let them have all the air they can get. They are planted out in February, or early in March, in rich well trenched ground (after Celery), one foot apart each way. Gentlemen's gardeners buy the same seed, but owing to their mismanagement during winter, and the poor state of the ground, they cannot grow such fine Lettuces as the market gardener. Some of the latter are, however, too greedy in regard to crops; for instance, they have often three crops in the ground all coming forward one after the other; but the best cultivators do not do this; it tramples the ground, and does not give any crop fair play. The rapid growth of a Lettuce depends much upon hoeing or stirring the soil. When well grown no tying is required; but badly managed plants have to be tied up a fortnight before they are sent to market.

Ridge Cucumbers.—I have seen 14 acres of these in one man's ground; they are germinated under glass, hardened off, and planted out 6 feet asunder, and 10 feet row from row; hand-glasses are put over them. When they begin to grow, the ground is well mulched with straw, to keep the earth moist and the fruit clean. Gherkins are sown in the open air at once, in well prepared ground, at the above distances; and I have known one party to cut in one day 200,000 fruit, which were all bespoken by oil merchants. Ever since the commencement of the Potato disease, however, Gherkins will not grow round London.

Scarlet Runners.—These are very often sown amongst Lettuces, 6 feet apart, about the 1st of April; but by far the best plan is to sow in beds thickly, and transplant by means of the dibber. No plant lifts better, and the moving makes them show flower much sooner. The usual practice is to take the heads off all the plants, leaving them a foot high, and to keep topping all the summer, which induces them to bear heavy crops; but the way of getting them to bear earliest is to save the roots in autumn, pack them away like Dahlia roots, and to transplant them again in March, 6 inches root from root, in rows 5 feet apart. It should be borne in mind, that if Beans are left to ripen, the roots will not be near so strong as they otherwise would be.

French Beans.—The best are the Negro, on account of the Beans being all green, and not marked or blotched like some others. They are also all one breadth, very narrow and handsome, and they are very dwarf and first-rate bearers; they are generally sown amongst Lettuces, Cauliflowers, &c., to succeed the standing crop; but the best way is to give them a piece of ground to themselves. The French Bean transplants nearly as well as the Scarlet Runner; therefore it might be treated in the same manner; they would also come in much earlier and grow less robust. The crop would not be quite so heavy; but earliness is everything for the London market.

Parsley.—The main winter crop is sown in April and May, and thinned out to 6 inches asunder, and a foot apart in the row. In picking, all the large or oldest portions are removed first, the head is never cut off at once, but not one bit is allowed to pass perfection. Parsley pays well for the attention it receives. *James Cuthill, Camberwell.*

## BRITISH SONG BIRDS.

No. XVI.—All needful matters connected with an "Aviary" have now been minutely and fully discussed. On looking back upon what has been written, I can find nothing to alter, nothing to add, and nothing I could wish unsaid.

It is no more than right to acknowledge; before dismissing this branch of our subject, my obligations to very many kind subscribers to the *Gardeners' Chronicle*, for "strengthening my hands" from week to week, by their written expressions of approval of what my pen has jotted down. Also, for their unsolicited confirmation of the truthfulness and great practical utility of my remarks in connection with the general subject. It is no less encouraging than it is surprising, to have given satisfaction to so large a mass of readers; nor will a knowledge of this, fail to give new life to what has to follow.

"A change now comes o'er the spirit of our dream." We turn from the "land of liberty," and have henceforward to speak of those little prisoners *only* whose fate "for better for worse" is more immediately in the hands of a master, a mistress, a servant, or a child. Before proceeding one step further, I beg again most earnestly to protest against any song bird being entrusted to the tender mercies of the two latter. Servants, in particular, are notoriously thoughtless, careless, and indifferent; children (as we all know but too well) are, in addition, too often remorselessly cruel.

Most of our pet birds owe their immediate death to neglect. To speak within compass, one-half of them, at least, perish from starvation. Herein lies a great moral evil, which cannot be too loudly nor too frequently spoken against. If people would but "reflect" for a moment, they surely would never be guilty of such a *sin*—for sin it is. *Verbum sat.*

Before entering on the universally-interesting subject of "Cage Birds," and speaking of each, individually, I wish to offer one or two passing observations which deserve attention.

In the first place, I would suggest that, before purchasing any cages, due regard should be paid to their being of a proper size, and in every respect adapted to the comfort and convenience of the intended occupant. This is a most important consideration. I have very frequently seen birds hung outside a window, with an open top, and with open sides to their cages—admitting not only the scorching rays of a meridian sun, but strong eddies of wind, and drenching showers. Many a bird falls sick from such gross neglect; and however fine his song may have been, it will, if he be thus exposed, soon be for ever silenced or ruined.

In no one instance is this unpardonable neglect more observable than in the case of the sky-lark—the very prince of our songsters. He unfortunately has the reputation of being a "hardy" bird, and therefore is hung out of the window, as we may see daily, the first time the sun shines; and in a cage with open wires on both sides! The currents of air passing the live-long day through the cage, over his head, and against his breast (the pressure of which he frequently cannot withstand)—are enough to ruin his constitution and his song for ever. The natural consequence of this exposure is—the bird gets puffy, and his voice becomes wiry, husky, and hoarse. He may rather be said to shriek than to sing; melody there is none. It is truly wonderful to observe the almost universal practice prevailing in this matter. It is no less impolitic than it is cruel.

Nothing can be more easy than to obviate all this. If one side of the cage were of wood, projecting the entire length of the front, and the other of wire, the birds would get plenty of air, and be snugly protected from the wind. If it were considered necessary to make them "hardy," by leaving them out in all weathers—a hideous fallacy—they would then find a sheltered corner in which to take refuge from the storm.

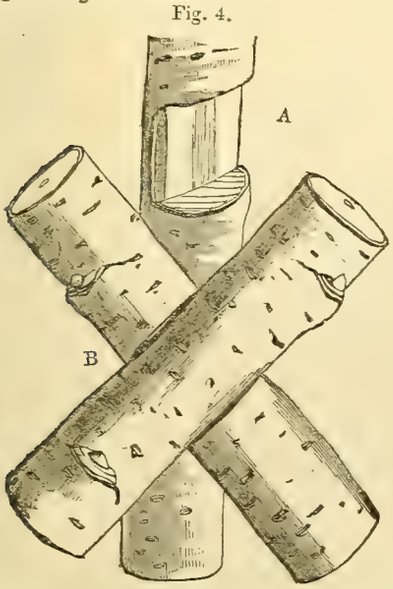
I have had sky-larks in full song for 14 years; and I have always treated them in this way. People have said, they could not possibly imagine how I got my birds to live so long. The fact is, they would not take any trouble about their birds; nor would they think how best they might contrive to keep them well, and make them happy in their confinement. When they died, as the saying is, "there was an end of them," and their places were quickly supplied with others. Miserable bird-fanciers, these!

Nor is due attention to the proper sizes of your cages the only thing required. The birds' perches must be well arranged, and so fixed as not to interfere one with the other. By no other method can you keep them, and consequently your birds' feet, clean. The water, too, must be changed in summer twice daily; and the seed looked to every morning. The gravelly sand, also, must be changed thrice weekly, and the birds' claws kept neatly cut.

In the matter of food, I should recommend a constant variety, in addition to the regular diet—such as egg, boiled hard; Lettuce, Chickweed, Groundsel, &c.; but no sugar. A little German paste, now and then, mixed with grated stale bun, is an agreeable change for your canaries, goldfinches, and linnets.

*Au reste*,—let your good sense be in active exercise day by day. Observation will tell you what your birds like, and what deranges their stomach. They are easily pleased, and as readily tamed. If you study *them*, they will study *you*. Above all, remember to keep them in every respect as clean, and give them as much change of air and scene, as you would your own children. They will render you, in return, the affection of a child. *Crede experto. William Kidd, New-road, Hammersmith.*

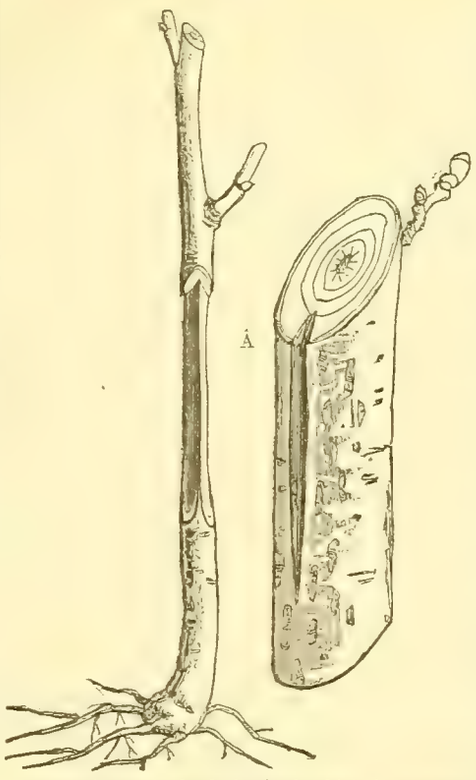
## VILLA AND SUBURBAN GARDENING.



Next to proper planting is a consistent arrangement of the plants employed in embellishing villa residences. Than this, no part of decorative gardening is in a

general way so badly executed. It may be performed, it is true, to suit the planter's pocket, but without any regard to the interest of the person who employs him. In this, however, the employed are not so much to blame, for he is screwed down to the last farthing; no margin is left for him, nor even a reasonable profit. Possessors of such residences are led to believe, that planting is efficient, when the borders are covered, and a formidable display of plants is exhibited. Their kinds are not questioned—their suitableness never considered, shrubs are shrubs, all the world over; and as long as there is abundance of them, parties feel that they are not taken in. They are to a great degree ignorant of the fact, that all kinds of plants will not thrive equally well in every soil. Rhododendrons and Kalmias are, on that account, thrust into clay to languish and ultimately to disappear. Weeping Willows are placed in sand-banks the first season which, together with other circumstances, in their train entail disappointment and disgust. But in the case of the soil being good, we then have Laurustinus perishing under Limes, Laurels smothering Azaleas, Portugal Laurels and Hollies obstructing walks, or blinding windows; in short, it would appear, that villa residences are planted with a total ignorance of the relation which plants have to particular situations. In this kind of gardening, apparent economy is indisputable extravagance; there can be no economy wherein the object to be attained is frustrated. How different would be the result, were these matters entrusted to competent persons, whose reputation depended upon the proper execution of the work?—and under such control, how different also would be the general aspect of our residences? In such cases, the first consideration with a planter of experience, would be to examine the soils, and to employ such plants only as would thrive vigorously in it. Those requiring peculiar soils, such as *American plants*, must have a congenial compost prepared for them, otherwise they will only become objects of pity. The next point will be their proper disposition, at the same time having an eye to their comparative growth, as well as to other circumstances, such as their contiguity to walks, buildings, and external views. These matters should be well matured beforehand, which they are sure to be by one who understands his business. The gross absurdities and obvious improprieties in laying out villa residences would thus be obviated, or at all events much alleviated. *Pharo.*

## GRAFTING.



No. V. Sylvain Inarching (*Greffe Sylvain*), *fig.* 4.—This mode of inarching is more especially adapted for uniting lozenges made with fruit-trees, Pear and Apple trees, trained as vases, of which the excessive vigour is required for the extension of the leading branches; this operation, performed at their points of junction, puts their sap in communication and unites the different parts in a remarkable manner. We may also practise this mode on trees with strong stems. Being planted at some distance, bend their head towards each other so as they may cross; make at this point a corresponding notch in each, like that represented at A, and unite the parts, as at B; and if they are thick, secure their contact with a strong nail, which should always be preferred to ligatures when there is much strain. The trees inarched by this proceeding may also serve for economical purposes, such as we have described in the preceding details. I am astonished that this simple mode of inarching is not more in use amongst some of our nurserymen who grow hedge-row trees.

Fig. 4.

Inarching small Plants on large Stocks; *fig.* 5.—When one has plants with slender branches and shoots to inarch on strong stocks, proceed as follows:—Cut the head of the stock in a slanting direction opposite to an eye or small branch; make at the base of this wound a long triangular cut in the substance of the bark and alburnum, as at A; its dimensions should always be proportioned to the size of the part to be inarched; cut the latter of an opposite form, and unite the parts; this union is sometimes difficult, on account of the difference which occasionally exists in the thickness of the barks. When perfectly taken, the inarched portion is separated from its parent stem, as explained in treating of the Monceau inarching.

Fig. 5.

After this we cut back the heel, which has hitherto served as a point of attachment for the ligature, and a magazine for the sap which has aided in uniting the parts inarched. If we wish to perform this mode of inarching on a large tree, of which the top has been broken by the winds, we plant near it a young one, and this can be inarched on the broken trunk as above indicated, excepting that instead of being sloped, it is cut horizontally. M. Thouin states that this mode is employed in the good climate of Caux; but in many other places they prefer crown grafting such trees, in the manner described by Pliny; others prefer grubbing them up. *Translated from the French of D'Albret.*

## THE CHRYSANTHEMUM INDICUM.

This is a plant which will amply repay the amateur for all the care he may bestow upon it. Blooming at a season when most other flowers are on the wane, it may truly be called "the last flower of autumn;" by it, a greenhouse or conservatory, during the dullest months of the year, may be made as attractive as at any other period. Until very lately few persons were aware of the perfection to which it might be brought by proper cultivation. Being perfectly hardy it was allowed to remain in the open ground throughout the year. This has been the principal cause of failure, amateurs forgetting that, although the winters of its own climate were as cold as our own, yet the summer heat was much greater, and consequently the blooming season was accelerated. It is one thing to grow a plant, but another to bloom it in perfection. In our variable climate it is not possible to reckon with certainty upon fine weather in October and November, without which the buds formed in September will not attain perfection; and frequently the early frosts of October cripple them altogether. To overcome these difficulties it is necessary to place the plants under glass as soon as the flower-bud begins to expand; but it must be borne in mind that air is as necessary as light or heat. By such means the flower may be enjoyed in perfection from October until January, and the greenhouse will present a succession of gay and varied colours.

The Chrysanthemum shows at Stoke Newington in 1849 and 1850, have done much to bring this beautiful autumnal flower into notice; in fact, none but those who were present on those occasions can form any idea of the size, beauty, or symmetry to which, under proper treatment, it may attain. What Messrs. James, Taylor, Lockner, Sanderson, and other amateurs of that neighbourhood have done will, next season, be attempted in other localities, and exhibitions of Chrysanthemums will, ere long, be as popular as those of the Dahlia or Pelargonium.

To such as intend growing specimen plants or cut flowers for competition, it will be necessary to prepare good rooted cuttings in April. These should be planted singly in 5-inch pots, in good rich soil, and plunged in a warm, airy situation. By the middle of May they should be stopped and shifted into larger pots. To insure dwarf bushy plants they should be again stopped in June, and then shifted into larger pots to bloom. During the summer months they must never be allowed to flag. If this once takes place the lower leaves will assuredly fall, and all hopes of fine specimens will be destroyed; towards the middle of September, the plants will have attained their full growth, and it will then be proper to put them under glass, but at the same time give as much air as possible in fine weather; the buds will now begin to show themselves; not more than one or two should be allowed to remain on each branch; liquid manure may at this time be applied with advantage; under such treatment, a fine show of blooms may be confidently expected. even in the most unfavourable seasons. Such as do not desire specimen plants or cut flowers for exhibition, I would recommend to plant their cuttings in the open ground at the end of April; to stop them in May, and again in June. By the end of September they will be fine large plants; and as soon as the buds begin to swell, they may be taken up with a good ball of earth and planted in 11 or 9-inch pots, and plunged in the open ground for 8 or 10 days, during which time they should be well watered every day, to prevent flagging; after that time they may be removed to the conservatory, which they will ornament till the month of January.

The following varieties will be found most proper for Specimen Plants, Cut Blooms, and Conservatories; each of these purposes is distinguished by its initials:—

Annie Salter, S., C. B., and C., yellow.
Astreé Brillant, C. B. and C., yellow buff.
Beauty, C. B., blush.
Biscio, C., violet carmine.
Christine, S., C. B., and C., rose peach.
Campestroni, C. B. and C., deep rose.
Calypso, C. B. and C., peach.
Cloth of Gold, C., golden yellow.
Defiance, S., C. B., and C., white.
Dupont de L'Eure, S., C. B., and C., purple and orange.
Duke, C. B. and C., blush.
Doria, C. B. and C., yellow.
Duchesse d'Aumale, C., white.
Fleur de Marie, S., C. B., and C., white anemone.
Golden Cluster, S., C. B., and C., golden yellow.
Gluck, S., C. B., and C., yellow anemone.
Goliah, C. B. and C., white.
General Morceau, C. B. and C., buff.
Jenny Lind, S., C. B., and C., sulphur white.
Imperial, C. B. and C., blush.
King, C. B., rose.
King of Crimsons, C., deep crimson.
Lysias, S., C. B., and C., reddish salmon.
Lady Talfourd, C., pure white.
Lady Hunloke, C. B. and C., buff and orange.
L'Ange Gardien, C., white.
Madame Poggi, S., C. B., and C., crimson.
Madame Comerson, S. and C., crimson tipped gold.
Madame Godereau, C. B. and C., blush anemone.
Medusa, S. and C., rosy carmine.
Nancy de Sermet, S., C.B., and C., white anemone.
Pilot, S., C. B., and C., bright rose.
Princess Marie, S., C. B., and C., rose.
Pio nono, S., C. B., and C., crimson-tipped gold.
Pygmaleon, S. and C., rose carmine.
Peruvienne, S. and C., deep yellow.
Prince of Wales, C., red salmon.
Phidias, New, C. B. and C., rose and white.
Queen of England, S., C. B., and C., blush.
Rebecca, S., C.B., and C., peach.
Rabelais, C. B., reddish carmine.
Sulphureum Pallidum, C., yellow anemone.
Sydenham, S. and C., light red crimson.
Temple de Salomon, S., C.B., and C., bright yellow.
Two-Coloured Incurved, C.B., red and yellow.
Uranus, C. B. and C., rosy yellow.
Vesta, S., C. B., and C., white.
Vulcain, S., C.B., and C., deep crimson.
Vortigern, S., C. B., and C., dark crimson.
Warden, C. B., orange.

*John Salter, F.H.S., Versailles Nursery, Hammersmith Turnpike.*

## Home Correspondence.

*A Useful Cabbage.*—In the summer of 1847, I had presented to me a handful of Cabbage seeds by Mr. Charles Farnes, late of St. John's-street, Smithfield, in order that I might, with him, further test the quality of the then new variety since named the "Enfield Market." These seeds were sown in the third week of July, of that year, in a freshly-dug, and finely pulverised border, and as the weather set in very hot and dry, I covered the bed with an old mat, pegging it down, to prevent its removal by wind. Treated in this way, the seeds germinated quickly, and the mat was then removed. The plants were pricked out into a nursery bed, about the middle of September, 4 inches apart, and in rows 6 inches asunder. They remained here till the first week in March, of the following year, only receiving an occasional stirring between the plants, after heavy rains, when the soil had become sufficiently dry for that purpose. Under these circumstances, the watering-pot was never needed. The quarter into which they were planted had been well trenched and ridged during the winter, and it was broken down to receive the plants early in March. They were placed in rows 20 inches apart, and the plants stood 12 inches asunder in the rows. They soon got established, and, in a short time, made a goodly display, forming a plantation 22 yards long by 9 yards wide. From this area, an early supply of summer Cabbages of medium growth was obtained, free from coarseness, very fleshy, mild in flavour, having compact and solid hearts, very uniform, and in every respect by far the best and most serviceable vegetable of the Brassica tribe I possessed. Mr. Kenwick, then manager of the firm from which I received the seeds, stated that I should need no other variety, and so it has since proved; for its earliness, hardiness, and continuance thoroughly justify me in asserting that I require no other. After the summer cutting its disposition is to reproduce a constant supply, each plant making three or four nice compact and hearted heads, and even after these are removed it makes an effort to yield a third crop, as may be seen in my Cabbage quarter at the present time. The same treatment has been continued each season since I first received the sample, and, if possible, with increased success. One sowing, one pricking out, and one planting have sufficed to provide for my demands (14 of a family), during the past summer. Mr. Cuthill, in his papers on Market Gardening, omits to mention the kinds of Cabbages generally grown round London, but I am aware that the Enfield Market is highly prized by all who have tried it (for it is yet comparatively new). I know that one grower alone sowed 16 lbs. of seed of it

last year, so satisfied was he of its good qualities. He said, "I cannot get on without it." Mr. Cuthill remarks that certain allowances are made for "runaways." Now, for these three years past, and sowing as I do so early, I have never had a plant run: no mean recommendation. I am unable to give the *aliases*, which pertain to it, and which are sure to follow every really good thing; but the "Enfield Market," if I am not mistaken, has already given us a "King of Cabbages." *J. Edwards, Wace Cottage, Holloway.*

*Browæa coccinea.*—It is somewhat surprising that this fine stove shrub is not more generally cultivated, for the flowers are rich and brilliant, and the foliage beautiful. It is certainly one of the finest flowering shrubs in cultivation, and may be almost ranked with the noble Amherstia itself. The flowers are naturally produced during the winter months, when few things are in bloom, which enhances its value and makes it eminently adapted for decorating the stove at this dreary season. Perhaps the high degree of temperature and moist atmosphere necessary to bring it to perfection form the greatest objections to its general cultivation, but some believe that it will not produce flowers until it has attained a considerable size; this however is a mistake. Specimens here, about 2 feet high, have flowered abundantly. As regards propagation, young shoots taken off with a portion of well ripened wood adhering to their base, root readily if firmly planted in silver sand, placed under a bell-glass, and plunged in bottom-heat. The best soil for it is a mixture of rough peat and turfy loam, with the addition of a little sand. In shifting use good sized pots, for it delights in having plenty of root room. Being an inhabitant of the hottest parts of South America and the West Indies, a strong heat, well saturated with moisture, is indispensable at the respective periods of flowering and growth; at the former a temperature ranging from 65° to 75° suits it; during the latter, which takes place in the spring and early part of the summer, the temperature may be allowed to increase to 90° or even 100° by the heat of the sun; and the air at this period can scarcely be too much saturated with humidity. It will bear exposure to the sun. Plants of it here have not been shaded even during the hottest days of summer. Watering at the roots should be carefully attended to, and an occasional application of weak liquid manure will be beneficial. In the latter part of the summer, water should be gradually withheld and the temperature lowered, so as to give the plants a rest, when little care is required. This will induce flower-buds to be formed; they are produced in bunches along the main stem and near the extremities of the branches. When the buds begin to swell, heat and moisture should again be gradually given. Under the above treatment a large plant here is now flowering profusely. *Walter Hill, Royal Gardens, Kew.*

*Length of Fibrous Roots of Annuals.*—I was invited a short time since by a gentleman of this town to inspect the roots of a plant of Mignonette, which had penetrated through several courses of bricks, and descended far into a wine cellar. Over the cellar, which was outside the dwelling-house, was a brick pavement, between the joints of which Mignonette seed had been sown from year to year. At the extreme end a small portion of soil was allowed, and here a plant or two grew more vigorously than the rest, though not so luxuriantly as is often found in a common border. The roots of these plants had penetrated through 18 inches of brickwork, and some of them were hanging inside the arched roof, nourished by the damp atmosphere only. A few, more favourably situated, were attached to the end wall of the cellar, and had descended 5 feet 5 inches down the wall into the decaying sawdust of the wine bin. Others were beautifully spread over the wall, with a thousand ramifying rootlets, bespangled with minute chrystal-like damp drops, and extending over a space of 5 feet in width. It was difficult to trace the brittle roots that had penetrated the sawdust, but I measured some upwards of 7 feet below the surface of the brickwork on which the plants were growing. *Carey Tyso, Florist, Wallingford.*

*Cottage Garden Edgings.*—I have an idea that the most economical material for this purpose, in East Norfolk, will be found to be flint stones, and those from Cromer Beach will be the best colour. Next to them I would select those taken from marl and chalk pits. The soil in the borders being level with the gravel in the walks, use ball-shaped stones for the sharp bends and curves, and egg-shaped ones in straight lines and gentle curves. If your East Norfolk correspondent will honour me with a visit, I will show him, in my own garden, a superior edging for raised flower beds. *W. Thorold, Thorpe Bower, near Norwich.*——I would recommend the adoption of slate as a neat and durable edging for cottage garden-walks. Not the kind in common use for the roofs of buildings, but that of ⅝ of an inch in thickness. The width, or what would be the depth when set up, need not be more than 6 inches. It should be rounded off a little on that edge intended to remain above ground. In order to make it remain firmly fixed in its place, the ends of the different lengths could be made to rest on small blocks of well-seasoned Oak, and let into a groove cut perpendicularly in the wood 2½ inches. This would allow the block to be covered with soil 2 inches deep, leaving 1½ inches of the slate above ground for the edging. This would necessarily take a little more time than planting a Box edging, which is, for several reasons, objectionable; but it might be well enough executed by an intelligent labourer. The ground under the blocks would require to be rammed down solid to prevent their sinking, and a common level or line applied to get them down even, so that the ends of the different pieces of slate would fit closely together. *A. D., Arundel.*

*Out-door Vines.*—As respects the Vine at Nettlecombe, I beg to refer Mr. Elworthy again to the article at page 822; he says that I assert "it is impossible to give it any assistance in the shape of nourishment," and adds that "it receives a great deal of nourishment from rain water, &c." Now everybody must have known that a Vine, in the open air, could not well escape that. It is planted near a door-way, and children play their wanton games above its roots. The surface is firm, and on a sharp declivity, so that the water passes readily away. As to mortar, I had Mr. E's. own words on that point, as well as regards its name. Mr E. says "your correspondent is right in stating that the fruit is very fine," but I could not say that, for the berries are far too small. The garden contains different kinds of stones—one part is on a fine lime-stone rock covered with grit-stone. I glean from my scrap-book for 1844 and 1845, that the Vine was winter pruned to two eyes, and summer pruned in the end of June. The shoots were a good length; it would strengthen the bunch to pinch the top off the shoot soon after the bunch had formed, and to remove all useless buds as soon as possible. *W. Culverwell.*

*Early Tulips.*—I have grown these for many years, two and three in a pot; but when blooming time has arrived I have often been disappointed; for they seldom were all in an equally forward state. This season, however, I have managed things better; I planted in shallow pans, and moved them into pots after they came into blossom. I find that they may be transplanted without risk; and in this way I have had charming pots of well-flowered Van Thols, which were quite the admiration of the neighbourhood. *J. M. H.*

*Grafting Cacti.*—At page 22, Cereus triangularis is strongly recommended as a stock for C. flagelliformis, on account of its rapidity of growth, and comparative hardihood. I have no experience with it as a stock, but I have grafted C. flagelliformis on C. speciosissimus. I find it difficult to retain the scions in their position when inserted in the angle of the stem, and therefore I tried the following method. I cut the top off the stocks horizontally, and then inserted the grafts, which were about 2 inches in length, and wedge-shaped at the base; as many were placed on each stock as could conveniently be inserted. In my opinion they are more interesting when grafted in this manner than in any other; and, by stopping, the shoots may be multiplied to a great extent. *W. R., Chesterfield.*

*Market Gardening round London.*—In his article of the 4th inst., I consider Mr. Cuthill to have fallen into an error, which I venture to correct. He states that "when the 5 acre piece is cleared of Coleworts, say by the 1st of March, it is dunged and trenched two spades deep, and sown with Onions; and often Lettuces are planted on the beds as well as in the alleys." I do not know where he has seen Onions, which are intended to bulb, grown on the bed system, but I am certain not at Fulham. If he wishes to infer that that is the best plan for a private grower, I hold with him; but he is writing about the market-gardeners' plan, and I can assure him that that is not their system. I was brought up in the parish of Fulham to market gardening, which my father and his father before him followed all their lives, and having had years of experience in the business myself under my relations, who carry on market gardening now, and having assisted both to sow and hoe many an acre, I think myself qualified to give your readers the exact plan adopted, which is as follows. In autumn, the ground which is intended for Onions, is dunged and dug, and planted with Coleworts. About Christmas they commence taking them to market; and as fast as the ground is cleared, it is either dug up roughly, or else ridge-trenched (but not again dunged); it is all cleared and dug by the beginning of March, and in the middle of that month it is forked down. It is then man-harrowed lengthways and crossways; then it is rolled with a wooden roller, sowed broadcast, and harrowed again twice over. After this it is trod by women as closely as they can tread, and raked, with wooden rakes, to make it quite level, which finishes the operation. It is true that market gardeners often sow a little Lettuce seed with their Onions, but this is merely done in order that if the Onions should fail in any particular spot, the men, when hoeing, may have an opportunity of leaving a Lettuce or two to fill up, but if the Onions prove a regular crop they have orders to cut up all Lettuces, for if left they would injure the Onions, which are the most valuable of the two. They are hoed out to 4 inches apart, leaving the plants singly and free from weeds. *J. Steel, Clitheroe.*

*Roses in continuous Bloom.*—The subject of "Crito's" letter, at p. 5, on continuous blooming Roses, is a very interesting one. Nothing would more tend to improve the beauty of our Rose borders than such a classification as he suggests, and which I have myself, for several years, been taking much pains to effect. I greatly fear, however, that it will be exceedingly difficult, if not altogether impossible, because, I have, in many cases, observed that a particular variety will be a very late bloomer in one garden, when it does not prove so in another; and even that a variety which has peculiarly deserved the name of "perpetual" in my own garden, one season, will not always do the same. A striking instance of this occurs in the list given by "Crito," of Roses which he considers the most to be depended upon as perpetual bloomers. Among others, he names "William Jesse." This is, with me, a very favourite Rose; but I have always considered it to be its only fault, that it is not a perpetual, though called so. In my garden, and in others which I am acquainted with, in other counties, it proves very little better, in point of duration, than a summer Rose. I named the circumstance some time ago to Messrs. Paul, and asked why they classed it as a perpetual. They replied, that some had found fault at its being called a perpetual, and others at its being classed among the hybrid Chinas; and that he had, consequently, placed it in both classes. In their list for the present year we find it in both. This seems to me to throw a great doubt upon our ever being able to accomplish that very great desideratum, which is the subject of "Crito's" communication. I am afraid that the evil which he deprecates, of having a number of blanks in our Rose beds, from some of the varieties, in some seasons, not flowering so late as the rest, will prove (with our present Roses, at least) unavoidable. "Crito" is certainly correct, in stating that the Bourbons, Chinas, and Noisettes, are the sorts most to be depended on, especially the varieties he has named. *Omicron, Ashby-de-la-Zouch.*

*How to smoke a Greenhouse effectually.*—I have tried the plan mentioned at page 38, and have much pleasure in adding my testimony to its excellence. My house being rather large, I used six rolls of tobacco in touch-paper, placed them in various parts of the house, and the result has been the entire destruction of the green fly. I beg to express my gratitude to Mr. Huggins for making public this simple and effectual remedy. *J. J. F., Devizes.*

*Heracleum giganteum.*—This is the proper season for sowing the seed of the fine herbaceous plant, Heracleum giganteum. For rough scenery, this is one of the best plants that can be grown, and in a moist situation in a garden, its appearance is very striking. *Hardy and Son, Maldon.*

*Prize Gooseberries.*—Thinking it might be useful, I have ventured to send you the names of the following Gooseberries, six varieties in each colour, and the number of prizes each has won the last season, with the weight of the heaviest berries attached to each variety.

—*E. T.*

*Potatoes.*—Every year since the Potato disease began I have sorted my Potatoes, and boiled those which were infected, and when soft, beat them down with salt in air-tight casks. The knowledge of this induced a relation of mine to try if there was any degree of heat that would stop the disease without destroying life in the Potato. This was done by placing diseased Potatoes in water of 130°, and keeping them there for 10 minutes. There is evidently life in them, as they are now growing in the drawer in which they have been kept. *C. A. A. Lloyd, Whittington, Oswestry.*

*Saving Cucumber Seed.*—Many have failed in saving seed from good varieties; they expect that the seeds of long fruit will produce long Cucumbers: but in my opinion it does not matter whether the fruit is long or short. My plan is to save fruit on the first, second, or third joints. If you go beyond the latter joint, 19 times out of 20 the result will be no seed, and then a good sort is lost. Seed certainly may be obtained beyond these joints in the more common kinds, but seldom in the case of a good sort. If I have a choice kind of Cucumber I like to save the first fruit I can get at one of these joints. This I have proved to be a safe plan. *H. Stillwell, Frogmore, St. Alban's, Herts.*

*White Fruit not Attractive to Birds.*—Birds appear to prefer red or purple fruit to white. The white Tartarian Cherry, a native of the Crimea, and a fine sweet-flavoured fruit, is not subject to their depredations, while the Mayduke, Bigarreau, and other varieties, suffer from their attacks. The white-fruited Elder escapes the notice of blackbirds, even when they have stripped bushes of the common purple fruit; and what is more striking, if not so palatable in flavour as the white variety. This kind is sold in the markets of Dresden for the purpose of making preserves. Boiled with sugar, they form a very fine dainty. Fruit devoid of colour, not having the appearance of being ripe, seems to be the reason why those epicures of Nature are not tempted to try it. *C. May, Hope Nursery, Bedale.*

*Winter Gardens* (*Jardins d'hiver*).—Why should not every square in London have a portion of its extent covered in as a jardin d'hiver? What an unwholesome waste for five months is Russell-square, and how plea-

sant would it be to exchange it for a certainty of finding always a dry and airy walk! A little management would insure very little of it being seen from outside, particularly as it need be of no height. How well would it pay to cover in Leicester-square thus, and light it at night, instead of allowing it to be the vile object it has been for many years. *Tay, Somerset.*

*Vitality of Seeds.*—In numerous works on botany, and kindred subjects, are recorded instances of the long sustained vitality of seeds, the sudden springing up of vegetable forms previously unknown in the locality, or the disappearance of existing species, and the occupation of their habitats by other species far removed in affinity from their predecessors. Professor Lindley, in the "Theory of Horticulture," tells us that he has raised "Raspberry plants from seeds found in an ancient barrow in Dorsetshire, which seeds, from the coins and other relics met with near them, may be estimated to have lain there 16 or 17 centuries." And from Professor Henslow we learn, that when portions of the fens of Cambridgeshire are drained and ploughed, crops of black and white Mustard appear; and I think the same author mentions a circumstance occurring at Chelsea, of a plant till then unknown in the neighbourhood, being found growing in the soil, taken from an old ditch there. Passing lately over a very wild track of land called the "Chase," belonging to the Marquis of Anglesea, adjoining his seat "Beaudesert," Staffordshire, I was struck with the following analogous circumstance. In many places the patches of Gorse or Furze had been burnt; wherever this occurred, thousands of plants of Foxglove (Digitalis purpurea) had sprung up. I could not see a plant in any other situation. The outline of the patches of Gorse were very intricate, and the young plants of Digitalis had followed them exactly, but nowhere except the burnt patches. *G. L.*

*Jackson's Kidney Potato.*—In the advertisement respecting this Potatoe, there is a testimonial from Mr. Sharp, late gardener at Pitfour, Perthshire, in which he states that he has found it to be earlier and a superior flavoured Potato to any other he knows; and, on account of its dwarf habit, he recommends it as an excellent variety for frame forcing. I had a small quantity of this sort last year; I planted about half a bushel of it on the end of a border, the rest of which was occupied with the old Ash-leaved Kidney. Both sorts were put in whole, on the same day, and received the same treatment in every respect. The old Ash-leaved Kidney was full grown, taken up, and sold, three weeks before Messrs. Jackson's was ready. As for its dwarf habit, with me it grew fully two feet high, while the other sort was not more than one. It produced a good crop, but not better than the other. I suspect that I must have got the wrong variety, though I had the seed from Messrs. Jackson. Perhaps the latter or some of your readers who have grown this Potato will clear up the matter, by stating their experience in regard to its qualities. *A Market Gardener, near Edinburgh, Dec.* 19.

*Allamanda cathartica.*—I have always luxuriant specimens of this fine stove shrub clad with flowers from the beginning of June to the end of July. Whenever it ceases flowering the weaker shoots should be cut back half their length, and the plant at the same time plunged up to the rim of the pot in some loose material, such as half-decayed leaves or tan-bark, where it will have the benefit of a bottom heat of 55°. A gentle, but steady warmth of this kind round the roots keeps them in a sound, healthy state, ready to push and do their work whenever it is desired, and there is scarcely a leaf lost; whereas if left on a dry table or stage, as is customary with many stove plants in the winter time, it requires water oftener, as it quickly escapes by evaporation; and consequently the sudden change that takes place about the roots, by watering at times in a low temperature, and more especially when the plant is at rest, very often proves fatal to the delicate spongioles of the Allamanda; or, at least, prevents it from flowering until it recovers its health in a high temperature. In the beginning of February it is necessary to turn it out of the pot, in order to ascertain the state of the roots. If they are found to have made a considerable number of young fibres, they will require to be potted at once into a size larger pot, using strong turfy loam, which is well mixed with vegetable matter, and that has laid in a heap a year at least, adding one-third of peat obtained where the common Heath grows best. These must be well mixed, and should receive a good sprinkling of silver sand. The drainage must be efficient; over the large circular piece of broken pot place at least 2 inches of smaller crocks, which will require to be covered neatly all over with the tough pieces of peat. Then partly fill in with the compost alluded to, so that the collar of the plant is half an inch below the top of the pot. The ball of the plant is placed on this, and the soil pressed gently down all round the roots with the fingers, making it equal to the original in firmness, in order that all may absorb water alike, and when completed the whole should get a good watering of lukewarm water. The plant must now be replunged where it will have an additional bottom-heat of 15°, increasing the temperature of the house as the day lengthens. In March it will be found to have made pretty good shoots, which must be encouraged by keeping up a bottom-heat of 90°, with a moist atmosphere of 80°, giving manure-water once every fortnight. In May the roots will be found to have nearly filled the pot, and flower-buds will make their appearance, when it is necessary to lift it by degrees out of the plunging material, and to place it on a table or stage where it will flower. It should be trained when the shoots are nearly their full length. A Melon bed made of stable-dung is one of the best places I ever found for growing the Allamanda in. A large plant may be made of it in one season. *J. M'Pherson, Reswallie, Forfarshire.*

*The Mildness of the Season* is sufficiently indicated by the number of flowers prematurely distributed about our borders, as well as by the rapid growth of many herbaceous plants. This day, Jan. 29, the following are in flower in my garden, viz., Scilla sibirica, Polyanthuses, Snowdrops, Wallflowers, yellow Crocuses, single white Hepaticas, and Helleborus niger, the latter a mass of 13 fully expanded blossoms, each measuring from 2½ to 3 inches in diameter; Roses, Antirrhinums, Aconites, Ranunculuses, Japan Anemones, Pansies, Potentillas, Pæonies, Sisyrinchium grandiflorum. Some Phloxes and Tulips, &c., are making vigorous growth, for which I fear some may yet be punished, as was very generally the case during last April and May. The Coreopsis Atkinsoni (seeds of which I received last spring from the Horticultural Society) has withstood the winter. My plant is now of a lively green colour, very robust, and to all appearance it will bloom early. Is it considered an annual? *J. Edwards, Holloway.*

*Rain.*—The following fell at Goodamoor, Plympton St. Mary, Devon, during 1850. It was measured by Howard's rain gage:

## Garden Memoranda.

Messrs Henderson's Pine-apple Place.—Jasminum nudiflorum, in the shape of a small bush, has been blooming in the open ground here for some weeks past. It promises to be one of the most desirable of our winter-flowering shrubs. The show house is already gay with the various spring bulbs, such as Hyacinths, Roman Narcissus, Van Thol and Tournesol Tulips, &c., intermixed, here and there, with small examples of the deliciously sweet-smelling Daphne odora rosea, Cyclamens, Chinese Primulas, and Cinerarias. These, again, are backed up by Epacrises, the Winter Heath, Linum trigynum, Camellias, Rhododendron Nobleanum, and one or two other plants. The stove contained flowering specimens of Centradenia floribunda, Pentlandia miniata, an Amaryllid or two, some Begonias, which are always gay during winter; the white variety of Poinsettia pulcherrima, and some other things; the specimen house was filled with excellent plants, neatly arranged. Eriostemon intermedium, the most handsome of the genus, was just coming into flower, in which condition it will remain for many months. Styphelia tubiflora, one of the earliest of Epacrids, was in full blossom, and we observed a spike or two of the curious hybrid Veronica Andersoni coming into beauty. Double Chinese Primulas, the red and fringed white, were in bloom here. These were in deep pans, and were specimens of considerable size. The way in which they are cultivated here is to strike them cuttings, in Spring; keep them growing slowly till August, when they are more liberally shifted and more generously treated, and they blossom about Christmas. After they have done flowering they are placed near the glass, and kept rather dry and cool, so as to give them a season of rest till the beginning of August, when they are repotted, their branches spread out and pegged down, and under this kind of management they blossom much better the second year than the first, beginning about Christmas and continuing on till May. The old plants are thrown away after they have flowered, the second year, and their places are supplied by one-year-old plants. The variety of Correæ called "Brilliant" was in blossom here, as was also a small plant of the deep purple-coloured Hovea pungens, a beautiful New Holland shrub; but difficult to manage. We likewise remarked in this house some "tree" Carnations, whose perpetual habit of blooming must render them favourites. After flowering they will be shortened back, summered in the open ground, and then brought into the greenhouse to blossom again next winter. It is stated that Cryptomeria japonica, though hardy, becomes brown in winter, when to be effective it should be green. A specimen in this nursery exhibited this defect. It was growing close to the edge of a small pond.

## Miscellaneous.

*Montreal Botanical Society.*—We learn from the *Montreal Gazette* that a meeting had been held on the 29th of December last, for the purpose of forming a Botanical Society in that city. It was resolved that it should have for its object, principally, mutual instruction in the study of botany, the investigation of plants indigenous to the country, and the classification and examination of the fruits cultivated in Canada. It was also resolved, in order that information regarding the structure, uses, and classification of plants may be more widely disseminated, that a library be formed, principally of botanical works. Office bearers were appointed and another meeting convened for the further prosecution of the objects of the society.

*Botanic Garden, Cambridge.*—We understand that Mr. J. Stratton, of the Royal Botanic Garden, Edinburgh, has been elected Curator of this Botanic Garden, in the room of the late Mr. Murray.

*How to Destroy Ants and Caterpillars.*—The following method of destroying ants and caterpillars, though old, is but little known, and very successful and simple. It consists in scattering spirits of turpentine over the places where the insects are, by means of a brush struck against the hand so as to cause the turpentine to fall out like rain. If the ants are in a pot, they will all leave if a little turpentine be applied, so as to form a circle round it. Soap and water has been long a famous remedy against caterpillars; but M. Manelle, to whom we are indebted for this article, finds that soap lather is much more efficient. A wet brush rubbed on a piece of soap produces, as is well known, a great quantity of lather, and if this be applied to the parts attacked by caterpillars, they are instantly destroyed. If the caterpillars cannot be reached with the hand, the soap may be applied to them by a horse-hair brush on a long handle. The morning and evening, when the caterpillars collect together, are the best times for performing this operation. *Flore des Serres.* [We presume that soft soap is here intended.]

*Method of compelling the buds of Camellia reticulata to develop.*—Every amateur is aware of the tendency of Camellia reticulata to bud but not to produce branches; this tendency causes the plant to appear much poorer than the other varieties, and accounts for the small quantity of flowers usually found upon it. Last year, towards the end of April, I pinched the young shoots of a vigorous plant when they were about 6 inches long. This year the plant has three flowers and 27 buds, many of them being on three or four-year old wood, which never happens when this Camellia is left to itself. Another similar operation will give me a plant with as many flowers as the other sorts. I only remove the two last eyes. *Neumann.*

*Death of Mr. Christie.*—We regret to announce the death of Mr. Thomas Christie, which happened on the 19th ult., at Blackrock, Dublin. He was 98 years of age, and had discharged the duties of steward and gardener to the present Sir Harcourt Lees and his father, the late Sir John Lees, during the long period of 75 years. He was born in Fifeshire on the 2d February, 1753, and went to Ireland in June 1772, to act in the capacity of a journeyman gardener to the late Lord Mountjoy, in the Phœnix Park. Early in 1776, he went to live with the late Sir John Lees, as steward and gardener, where he remained until his death. A service of such long duration is, perhaps, not on record, and certainly, no man ever performed the duties intrusted to him with more fidelity. Within four days of his death he was superintending his men. He was a keen observer of political events, and living as he did during the most eventful periods of Ireland's history, he was able to record many remarkable scenes he had witnessed, as well as to refer to the great changes which had taken place within his recollection. In appearance and dress he personified the respectable gardeners of the last century.

*Potato Cultivation in Jersey.*—*Notes on several varieties of early and second early Potatoes, grown last year by Mr. Bernard Saunders, as extracted from a register kept by him:*—1. "Shepherd's Fame," "Cockney," or "Barrington," planted the first week in January, were ready for use early in May, and were dug up for seed in July, first-rate in quality; dwarf, and produced no blossom; crop, from 6 to 8 cabots per perch. 2. "Early Frame," planted on the 4th of January, were fit for use early in May, very dwarf, no bloom, dug up for seed on 12th July, quite ripe, a good middle-sized Potato; produce, full 8 cabots to the perch, and excellent in quality. 3. "Martin's Early," planted on 6th January, fit for use by the middle of May, moderately dwarf, shows bloom, but does not expand, the stalks were destroyed by blight in June, which caused the produce to run small, and only at the rate of 4 cabots to the perch; in some seasons that quantity is doubled. 4. "Forty-fold," or "Osborne's Early," red or blue, planted on 6th January, fit for use in the beginning of May, dug up on the 12th July, quite ripe, very small, but of good quality, dry and floury; produced about 5 cabots to the perch, and were free from blight. 5. "Gold-finder," planted on 10th January, dug up ripe in July; did not bloom, but grew strongly, and were fit for use in middle of May; a well known variety; crop full 8 cabots to the perch, and of excellent quality. 6. "Hammond's Seedling," planted 12th January, were fit for use in the middle of May, and were finally dug up ripe in July; very sound, and a fine large Potato; no bloom; produced about 6 cabots to the perch, and excellent in quality — some seasons the crop is 8 cabots to the perch. 7. "King's Seedling," planted 4th January, were fit for use in the beginning of May, and ripe in July, a fine new oval-shaped Potato, raised from "Martin's Early." It produces but very few small ones, has no bloom, and very little stalk. It is remarkably white when boiled, mealy and good flavoured; produced from 6 to 7 cabots per perch; this is only its second year's trial, so that it promises to be an acquisition. 8. "Thurston's Conqueror," a very dwarf kind with no

bloom, planted 4th January, fit for use the beginning of May—ripe in July, middle size, quite round, and good in quality; produce about 5 cabots to the perch. Out of the above eight varieties (of the best early round sorts) five can be highly recommended, viz.: 1, 2, 5, 6, and 7, both for produce and for quality. *Early Kidney Potatoes, planted in January, and dug up Ripe in July.*—9. "Ash-leaf Kidney," decidedly one of the earliest and best for forcing, stalks short with no bloom; but it seldom produces above 1 or 2 cabots to the perch, and it is not fit for farm culture, or for profit to the gardener. 10. "Smith's Early White Kidney." This has no bloom, and is quite dwarf in growth, planted 10th of January; they were fit for use in the beginning of May, dug up quite ripe on 12th July, a beautiful clean silver-skinned, almost transparent kind—excellent in quality, and one of the most productive Kidney Potatoes known; crop from 6 to 7 cabots per perch. 11. "Champion Kidney," planted 6th January, ready for use middle of May, and fully ripe for seed in the end of July: it shows bloom, but it does not expand; finely shaped, and not over large; produces from 5 to 6 cabots per perch, sometimes more. *Second early Round Varieties.*—12. "Cork Red," planted 15th January, were fit for use in the beginning of June, and were ripe in July. It has a fine rough skin, and is of superior quality; size large; crop from 8 to 10 cabots per perch. 13. "York Whites," planted 18th January—fit for use in June, and fully ripe in the end of July; quality very superior; blooms do not expand; keeps good for use during the whole year; produces from 6 to 8 cabots per perch.—14. "Silver-skin," planted 1st February, were fit for use in the beginning of June, and ripe for seed in the end of July—equal in quality to "York whites"—remarkable for having scarcely a small Potato among them; produced from 7 to 8 cabots per perch; free of disease; skin very clean.—15. "Coole Curly," or "Scotch Regents," planted February 10, and dug up in the beginning of August, when they were quite ripe; quality excellent: keeps well through the winter, and is highly esteemed in the London markets; crop from 6 to 8 cabots per perch. *Second Early Kidneys.*—16. "Axbridge Kidney," planted 25th January, fit for use in the end of May, and fully ripe in the end of July; a very fine flavoured rich Potato, whose blooms drop off before opening; produces from 6 to 8 cabots per perch. 17. "Chalmers' Kidney," planted middle of February, were fit for use in the middle of July, and were fully ripe in the end of August; they are finely shaped, excellent in quality, and produce from 6 to 7 cabots per perch; as a market Potato there is not its equal. The above 17 varieties are selected from upwards of 50 sorts, grown by Mr. Saunders within the last 10 years, and have been carefully watched and most of them repeatedly tried, so as to prove fully their qualifications. It may be also useful to give the names of some sorts which he has had under cultivation, and which he would not recommend as productive varieties. They are as follow:—1, Red Kidney, a very uncertain cropper; 2, Pink Eye, very unproductive; 3, Devonshire Reds, ditto; 4, Cork Whites, ditto; 5, China Early, ditto; 6, Douglas Kidney, ditto; 7, Ash-leaved Kidney, ditto; 8, Red Kidney, ditto; 9, Yorkshire Kidney, ditto; 10, Easton Early Red, ditto; and 11, Black, ditto. The above-mentioned crops were (with the exception of two) manured with horse-dung, at the rate of 10 cart-loads to the vergée; and, when they were from 4 to 6 inches high, they were well dusted with dry slaked lime, about 2 hogsheads to the vergée, prepared for the purpose (this operation should be performed early in the morning whilst the dew is on them), after which they were flat-hoed to a good depth, and about a week or 10 days afterwards the earth was drawn round them. *Jersey Times.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Forcing-house.—Here, there will of necessity be many plants differing from each other in their nature, and in the degree of heat which they require. Some will bear more heat than others, and these will be best placed by themselves at the warm end of the house; while those requiring less heat can have the cool end, and be more freely supplied with air. The structure used for plant-forcing, should be of the lightest possible description, the inside being painted or coloured white, and the plants placed on or plunged in white gravel, or light coloured sand, in order that the greatest possible amount of light may be diffused and reflected amongst the foliage. The glass and laps should be perfectly clean. The ventilators should be so arranged that the air may be admitted under the pipes, and thus warmed to the temperature of the house before it comes in contact with the plants. Top air should be given by opening every sash a little, in preference to admitting the same quantity in several large currents. As the flowers expand, the plants should be removed to a cooler and drier atmosphere, with a view to prolong their period of blooming. It should be remembered that forced plants require a greater supply of water than the generality of things at this season; and when they are in a fit state to receive water, let sufficient be given to moisten thoroughly every part of the soil. Except in very dull weather, the syringe may be used with advantage once a day, upon those plants whose flowers have not yet expanded. Use water of the same temperature as the house for this purpose, as well as for watering the plants.

FORCING DEPARTMENT.

The early sown Melons will now be progressing, and a bed or pit should be got in readiness for them. In preparing beds for them, which are to be heated with litter, they should be so contrived that the necessary degree of heat may be obtained without the risk of burning the roots; but, at this early period, heating by means of hot-water pipes is far preferable. The pipes for supplying bottom heat should be merely a continuation of the top heat pipes through the pit, and should be covered with a few inches of gravel, upon which is laid from 14 to 18 inches of soil, for putting the plants into. We thus obtain top and bottom heat by the same circulation; and nothing can answer better. The earliest Melon I have tried is the Trentham Hybrid, which is also a free bearer. Look carefully to the litter upon the early Vine border, and see that it does not become too warm; 65° to 70° are sufficient at this early season.

FLORISTS' FLOWERS.

Dahlias may be placed in heat forthwith; the thick first shoots do not strike root so readily, neither do they make so good plants as those which are thinner. When they are about 2 inches long, they may be taken off, and cut across, immediately below a joint, and placed round the sides of a small pot in sand; plunged in a brisk heat they root quickly. Pansies.—Examine the beds carefully for snails, &c.; during the mild nights that we have lately had, ours suffered considerably; but a dusting of soot appears to have proved a riddance, besides causing the plants to assume a more healthy green colour.—In the Auricula frames the plants are fairly making a move, and, unless a severe check takes place, an early bloom may be expected. If retardation is desired, the plants may be placed in a colder situation, or, if the frame is a revolving one, they may be made to front the north. The quantity of water given may now be increased, taking care at all times to avoid hard or spring-water. The foliage should not be moistened, or the hearts of the plants filled with water, as careless florists will sometimes do, to their almost certain detriment. Keep a current of air amongst the plants, night and day, it is conducive to health and hardiness; bearing always in mind, that few plants suffer so much, from damp, or confinement, as the Auricula.—Other floral requirements as last week.

HARDY FRUIT GARDEN.

The training of wall trees should now be progressing with all speed, and Peaches or Nectarines on the open walls, which have any show for fruit should be protected, if this has not already been attended to. (See our remarks on this in January.) Among the espalier fruit trees, the flower buds of many of the hardier kinds are swelling fast; and as we may yet expect some severe weather, prudence points out the propriety of protecting anything which is choice or valuable. For this purpose, nothing is cheaper than Spruce or Yew branches, which are also of considerable service in retarding the opening of the blossoms, until the season is more favourable for their safe development. The ground should be forked over amongst bush fruits, taking care to injure the surface roots as little as possible, for upon these the fertility of the tree mainly depends. The Strawberry beds should also be looked over, the dead leaves and runners removed, and if it was omitted last autumn, the plants should be thinned where they require it. Some dry soot should now be dusted in amongst them to destroy snails; after which the spaces between the rows should be manured, and lightly forked over without breaking their roots. We find old Mushroom-beds excellent top dressings for Strawberries.

State of the Weather near London, for the week ending Jan. 30, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Apples: *J P.* These keep best in the dark, in a cool situation, if not below 40°; but, at all events, the place should not be subject to vicissitudes of temperature, to prevent which it should be lined with wood.‖

Back Numbers: Full price will be given for No. 38, 1848, and No. 47 for 1849. Full price will be given for Nos. 1, 2, 3, 8, 9, for 1846; and 40 and 50 for 1847.

Dahlias: *J C.* The following 36 are the best sent out in 1848, 49, and 50. Those of 1850 will not be high in price this spring; it would, therefore, be injudicious to omit them. Oakley's Gem, white and lavender; Shylock, scarlet; Toison d'Or, buff; Grenadier, ruby crimson; Mr. Seldon, rosy lilac; Miss Chaplin, peach and crimson; Privateer, yellow and red; Princess Louisa, salmon; Queen of the East, blush; Fearless, lilac; Richard Cobden, dark; Violet Perfection, violet purple; Charles Turner, blush and purple; Earl of Clarendon (Union), mottled orange; Duke of Wellington, orange; Duke of Cambridge, silvery lilac; Fame, shaded plum; Sir F. Bathurst, dark crimson; Elizabeth Daniels, pale rose; Magnificent, shaded rose; Mrs. Seldon, yellow; Queen of Lilacs, pale lilac; Seraph, bright orange; Snowflake, pencilled white; Utilis, crimson; Negro, dark maroon; John Edwards, orange scarlet; Queen of the Isles, white and lake; Thames Bank Hero, deep crimson; Mrs. C. Bacon, blush; Blanchfleur, white; Black Prince, dark crimson; Imbricata, dark purple; Anticipation, silvery lilac; Frederick Jerome, purple; Windsor Castle, shaded crimson. Twelve best Fancies of 1848 49, and 50. Conspicua, white and violet; Prockter's Elizabeth, blush and pink; Empereur de Maroc, maroon and white; Jeannette, red carmine, and white; Lady Grenville, dull red and white; Miss Compton, salmon scarlet and white; Girling's Jenny Lind, maroon and white; Mrs. Labouchere, scarlet and white; Gasparine Furstin Reuss, rich maroon and white tip; Lady Cullum, yellow tipped with white; Striata perfecta, lavender, spotted and striped with purple; and Madame Wachy, purple and white.*

Dracontium: *A H.* This Aroid plant, which they call the Spotted Dracontium, will live out of doors; a south wall is unnecessary. It is quite hardy.

Exposed Gardens: *Reader.* In an exposed garden, about 40 feet square, surrounded by 5 feet walls, on high ground, near the Thames, you may cultivate Potatoes, Onions, Lettuces, Cabbages. Parsley, Spinach, and Strawberries. As to Climbers, the Virginian Creeper or Clematis montana will possibly suit the situation you mention.

Fancy Geraniums: *Mrs M.* The following are a few of the best in cultivation:—Alboni, rosy pink, good in shape and size; Anais, cherry pink, shaded with white; Bouquet tout fait, shaded purple, good in shape; Beauty, dark crimson; Belle d'Epiany, in the way of Jenny Lind; Defiance, dark maroon, very fine; Empress, style of Queen Superb; Fairy Queen, good light; Formosum, pink and white; Hero of Surrey, maroon and white, good in shape; Jenny Lind, light pink and white, fine; Jehu Superb, dark purple and white, small; Madame Miellez, dark maroon; Magnificum, dark; Minerva, rosy pink, very compact; Orestes, good rosy pink and white; Picturatum, bright rose, very pretty, and a free bloomer; Perfection, upper petals crimson, lower ones bright pink; Queen Victoria, pale pink and white; Queen Superb, pinkish lilac, fine; Reine des Francais, showy pink and white, large; Rosati, attractive, light, good in habit; Wintonia, rosy lilac and white; Ytolinski, dark maroon, good in shape, and a free grower.*

Fruit Trees: *H B.* We presume your young fruit trees are intended for standards. As they have made vigorous shoots, you must shorten them to about a foot.—*C B H.* You should add to your present collection the Winter Nelis, Beurré Bosc, Thompson's, and Beurré Rance.‖

Heating: *x τ λ.* Arnott's stoves are unfit for your purpose, unless they have an evaporating pan on the top. You had better trust to a good flue built with *dished* tiles on the top, so that water can be retained. Let your front and end walls be solid brickwork; the roof only glazed. Do not give it a high pitch, only just avoid drip. Remember that Ferns do not like sunshine; but are always handsomest in imperfectly lighted places. Damp, warmth, and the diffused light of a thick wood are what you have to provide. They care little for ventilation

Insects: *G B L.* The larvæ which have appeared in millions beneath old tough sward are neither those of the gad-fly nor of the cockchaffer. They are those of some other species of beetle not hitherto recognised as destructive to vegetation. We will endeavour to rear them. *W.*—*Sir O. M.* The gall-like excrescences on the shoots of the Vine do not appear to us to have been caused by the larvæ of the beetle Otiorhynchus sulcatus, as we only found one of these larvæ in the galls sent. Nothing of this kind is recorded either by Audouin or the Baron Walckenaer. Unfortunately the single larva we found has escaped out of the box. It is, however, certainly that of one of the Curculionidæ. *W.*

Lilium monadelphum: *A H.* We apprehend that the reason why this plant lives for years in your border, and never flowers, is, that it has not heat enough in summer and autumn.

Monstrous Pears: *A G N.* Very curious. A woodcut is preparing, and in a week or two they will be a subject of a leading article.

Mowing Machines: *Sub.* We never recommend dealers.

Mulching: *Inquirer.* See p. 787 of our last year's volume.

Names of Plants: *E J R.* Photinia glabra.—*J N.* 1, Nothoiæna rufa, Presl.; 2, N. lævis, Mart. et. Gal. *S.*—We have to ask for the patience of one or two correspondents till next week, when they shall receive the best reply we can give them.—*Erzeroum.* 58, Ajuga orientalis; 635, Ajuga reptans? 151, Aj. chia.—*H B.* We never name Mosses.

Netting: *B H T.* Tanning woollen netting will help to preserve it, and will tend to prevent the moth from destroying it.

Orchard-houses: *B L.* See a Leading Article at p. 35 of the current year's volume. ‡

Peas: *M W.* Bishop's new Long-pod is the best early dwarf Pea, and Woodford's Dwarf Green Marrow is good for later sowing.‖

Peruvian Guano: *W B J, Clonkelly.* It is true that the house of *Gibbs, Bright, and Co.* of *Liverpool*, have no longer a contract with the Peruvian Government, but the contract of Messrs. Anthony Gibbs and Sons, of London, with the Peruvian Government, for the exclusive right of importing Peruvian guano into the United Kingdom, has still six years to run. This firm imports equally into Liverpool as to London, and in the former place they are represented by Messrs. Gibbs, Bright, and Co., who, however, have no other interest in the business than as their agents, Messrs. Anthony Gibbs and Sons, of London, being the sole principals of all that is imported into the kingdom. We take the present opportunity of warning you and others that the trade in spurious guano is as brisk as ever, the folly of buyers being, apparently, inexhaustible; and we counsel you most seriously to have nothing to do with any sellers unless they can satisfy you that they are accredited agents of Messrs. Anthony Gibbs and Sons, of 15, Bishopsgate-street, London.

Sun-dials: *Sub.* Sun-dials, for placing over the entrances of houses, &c., may be had of any of the great London opticians. Their cost varies from 30s. upwards, according to their size, and the angle at which they are set.‡

Wall Plants: *C A.* The following may possibly answer your purpose:—Cydonia japonica, scarlet; Jasminum officinale, white; Ceanothus azureus, blue; Magnolia grandiflora (Exmouth variety), white; Passiflora cærules, blue; Chimonanthus fragrans, brown and yellow; Wistaria sinensis, lilac; the larger variety of Bignonia radicans, orange scarlet; Lonicera flexuosa, white; Berberis fascicularis, yellow; Clematis montana, white; the Pyracantha, and common China, crimson Bourgault, and other Roses.‡

Misc.: *Lanarkshire.* The Calendar will be sent on receipt of seven postage stamps. We never recommend dealers.‡—*P T O.* We are unacquainted with "Meladores." Begonia fuchsioides will succeed under the treatment usually given to other Begonias.

IRISH PEAT CHARCOAL.
TO FARMERS, AGRICULTURISTS, AND OTHERS.

THE IRISH AMELIORATION SOCIETY beg to draw the attention of the public generally to the fertilising and deodorising properties of Irish Peat Charcoal. Mixed with night-soil or sewage matter it instantly and wholly destroys all offensive smell, renders it easy of manipulation, adapts the fertilising properties as a ready food for plants, and enables it to be transported by Railway or any other conveyance without the slightest inconvenience.

The extent to which Charcoal (carbon) enters into the composition of every article of agricultural produce, and the value of night-soil as a manure, render any observations on these points unnecessary. Mixed with night-soil, in about equal weights, a most efficacious manure is produced at a very small cost.

Price of the Charcoal, ready for use, at Dublin, exclusive of sacks, 35*s.* per ton; in London, Liverpool, Bristol, and other seaports in England, 48*s.* per ton, exclusive of sacks; or 60*s.* per ton, sacks included.—Agents will be forthwith appointed in all the principal towns in England.

Head Office, 9, Waterloo-place, London.
Feb. 1, 1851. L. PARROTT, Secretary.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.
40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

The Agricultural Gazette.
*SATURDAY, FEBRUARY* 1, 1851.

MEETINGS FOR THE FOLLOWING WEEK.
WEDNESDAY, Feb. 5—Agricultural Society of England.
THURSDAY, — 6—Agricultural Imp. Soc. of Ireland.

Mr. LAWRENCE, of Cirencester, has added a very excellent pamphlet to the number of the exhortations which have been addressed to the farmer upon EDUCATION.* In the course of it he illustrates the distinction between science and experience:—"While experience records *effects*, and is barren of all intelligence as to the *why* and the *wherefore*, science unfolds the causes, and their mode of operation." And he speaks of experience as of great importance in agricultural education:—"It teaches the seasons of the year, and even the dates at which the various preparations of the soil for the several crops, the planting, the sowing, and the harvesting will, in ordinary seasons, and under ordinary circumstances, be most successfully accomplished in the particular latitude, and on various soils. It teaches the circumstances under which, and the mode in which the various operations may be successfully performed, to a given extent. It teaches the selection of the breeds of animals best adapted to particular localities; everything in the breeding, and much in the rearing and general management of stock of all kinds; and it is omnipotent as respects all purchases and sales involved in farming operations. Experience, therefore, allied with attentive observation, is of great value, and her lessons should never be disregarded by you." But it is on the sciences related to agriculture that he lays the greatest stress as necessary to the complete education of the young farmer. "Science is knowledge, and knowledge is power:" it alone is able as a guide in untried circumstances:—

"Experience is nothing more than the observation of facts, and the remembrance of them with their attendant circumstances. It is the mere memory of effects, disconnected from their causes." "Attention to the lessons of both is necessary to your success in the practice of agriculture; and when you comprehend clearly what it is that each teaches, you will perceive, while the lessons of experience must be regarded with attention and respect, science also merits especial cultivation."

The pamphlet details the particulars in which science has been and will be of real utility in agriculture; it states and describes the efficiency of the agricultural college at Cirencester, and concludes with the following appropriate anecdote:—"On advising a farmer, recently, to give his son the advantage of three years' education, such as I have recommended, he observed, 'Why, Sir, that would cost 150*l.*, a pretty little fortune to begin business with;' I told him it was a *little* fortune, and the probability was much in favour of its dissipation by his untrained son within a year, either from want of knowledge or judgment, or from misfortune or fraud; but if invested in the *capital* of education, it would be beyond the reach of accident, diminution, or robbery, and would produce certain, and probably abundant, interest."

We strongly advise those who are debating with themselves how best to spend 150*l.* in the education of a son, to procure and study Mr. LAWRENCE's pamphlet. We must, however, add one word, not by way of criticism, for the point on which we should in that case say this pamphlet is deficient is one which hardly comes within the scope of scholastic education. There are three things necessary to make a successful farmer, even supposing him to have the means of energetically pursuing his business. The 1st—Intelligence, or as it is named in Mr. LAWRENCE's pamphlet—Science; the 2d—Experience, or the knowledge of good methods; the 3d is BUSINESS HABITS; and it is not referred to in this pamphlet. Now, so far as we have had experience, we believe that agriculturists will generally permit you to tax them with ignorance of science; the way they meet you there, if they are disposed for controversy on the point, is to dispute the exceeding usefulness of science; they will, however, rarely admit a want of practical ability, and in general there is much less ground for such a charge; if made, however, it is often taken as something very like an insult: but the third, in which we really believe that agriculturists are most deficient — and undoubtedly to their great injury—is ground on which we must not tread. It is not to bad book-keeping, or anything of that kind, pronounced although it is by a late Attorney-General as the high-road to bankruptcy in any business, that we now refer—that is a subject on which we may occasionally scold. But if we ever venture to hint that those among the farmers have themselves *alone* to blame for deficient balance-sheets, who throughout the year cannot be said to have regarded farming as a trade, requiring, as every other occupation does, the close and constant superintendence of a master—we are charged with insolently interfering where we have no business. Nevertheless, to this, as much as anything, we look for the improvement of agriculture—a closer and more constant attention to the details of the profession. Of course, such remarks will admit of personal application only here and there; but they do apply in many instances most justly, and wherever the pleasures of a country life are more regarded than the fieldwork of the agriculturist, he need not wonder if low prices do, indeed, destroy his capital. We venture, then, to add this remark on this one point, as a postscript to the letter Mr. LAWRENCE has addressed to "those who have resolved on farming, as their future occupation."

* A Letter on Agricultural Education, addressed to a Youth who has resolved on Farming as his future occupation. By CHARLES LAWRENCE, Esq. J. RIDGWAY, Piccadilly.

---

FOR some time past, as many of our readers doubtless know, two of the London daily newspapers have employed special correspondents to investigate the condition of our rural provinces; and they have collected a vast amount of information of great value to the farmer, which we hope to see reprinted ultimately as separate publications. The objects of the two inquiries are different. The correspondent of the *Times* confines himself almost exclusively to agriculture, while his contemporary takes up the much more comprehensive subject of labour in every branch of industry.

Labour is, of course, to every one an interesting subject: but the farmer who provides the raw material of many manufactures, and the food for all, must feel a deeper and more general interest in it than almost any other man. This appears not only in the case of those great channels of employment connected with the wool and cotton trades, where such stores of agricultural produce are annually consumed; but also in more limited and peculiar cases of less general importance: and to all of them we propose at present to direct attention.

The 45th letter of the correspondent of the *Morning Chronicle* relates to "the boot and shoemakers of Northampton."

The writer, to do justice to his subject, soon finds it necessary to describe the labours not only of the shoemaker but those of the tanner also, the currier, and the *grower of hides:* thus bringing home the subject to the door of the farmer himself. In reporting on the income of the currier, he says, "Where the person is paid by the piece, the amount of his earnings will depend to a great extent upon the quality of the skins upon which he is employed. The skins which are considered by the curriers as the best to work, are those which are tanned at Stourbridge. A great deal appears to depend not only upon the quality of the tanning which the skin undergoes, but upon the mode in which the beasts have been fed. The state of the hide affords a clear indication of the feeding of the beast; if he has not been forced it will run regular all through, but if forced it will be unequal, thick in the butt, and thin in the shoulder." Now it may seem idle to discuss the influence of different modes of feeding cattle, on the value of their hides—when the effects of these different modes upon their carcases have not yet been determined: but the question is of some importance, and as we believe the writer of the above to be in error, we shall take the liberty of stating our reasons.

(1.) The quality of the hide, generally speaking, will depend very much upon the breed. The skins of different breeds, although equally fed, are yet widely different from each other, both as to thickness and fineness of texture and "greasiness." The hide of the short-horn, for instance, differs widely from that of the Welsh breeds, or the Kyloe, or Galloway. (2.) The original quality of the hides of different individuals of any one breed are widely different from each other in all the above particulars, altogether independently of the treatment they receive. It is very obvious, then, that very great differences will exist in the tan-yard, where hides are promiscuously collected, and that still greater differences will result to the currier if the whole is subjected to a hasty and uniform process of tanning.

Again, the expression *forcing* a beast, although still used among farmers, is by no means a proper or scientific one; and it is therefore liable to be misapplied by parties probably not familiar with its meaning, for the forcing of an ox is neither less nor more than the proper feeding of an ox. We may cram a chicken, but we cannot get at the third stomach of a ruminating animal. The practice of changing food, so as to encourage the appetite, presupposes a previous defect in the quality given, and neither that nor mixing food, to tempt the animal to eat, can be construed into "forcing" it. The facts of the case are simply these. In the olden time the ox was fattened during summer, and starved during winter; and indeed in modern times the practice is but still too common; but, generally speaking, we are now striving to do away with the latter half of the practice, by fattening without intermission from the time the animal is calved.

The question, then, resolves itself into the effect produced upon the hide of the ox by the starving and proper feeding him, respectively; if he has been starved, it will "run regular all through!" but if "properly fed," it will be unequal—"thick in the butt and thin in the shoulder"—which seems absurd enough. If the starved ox turns his tail to the storm, as he invariably does, that certainly is not likely to make its skin grow thinner there than on the shoulder; nor, conversely, when properly fed and sheltered, is it likely that the opposite should be true. No doubt hides are younger now than formerly, resembling in this respect more nearly calf than neat hides; but taking into account the changes which have taken place in travelling, this makes them better adapted for the wants of the present age, provided they are equally well tanned. The skins of extra stock at Christmas exhibitions are complained of as "greasy;" and skins generally may be more greasy than formerly, and hence less fit for the more hasty system of tanning; but even granting they are so, the difficulty remains the same of solving the uneven quality charged upon the hides produced by improved farming; for although grease may resist the tannin longer, yet we must suppose hides to be pretty equally greasy throughout. Again, we have heard it said, we overstretch the hides of cattle now-a-days! "You farmers now so stuff and stretch the hides of oxen as to make them thinner; and, therefore, of less value!" Now, such theorists quite forget the continual change to which the animal system is subject, and also that what makes beef grow makes hide grow quite as fast to hold it.

And so we have glanced at the *pros* and *cons* of this question, to the extent the farmer is concerned in it, and find that raw hides, as produced by him, are better fitted for the times than those of former days, and that the complaints of tanners and of curriers to the contrary are without foundation—so that the greater difficulties experienced by the latter fall to be attributed to the less perfect state of the art of the former—a difference which they have a right to settle between themselves, but not to lay at the door of the farmer, or saddle him with their bad leather.

---

## A TRIP TO NORTH DEVON.

AT a time when we are all agreed that agriculture must progress, it may be interesting and instructive to watch and exhibit amendment wherever we find it. Having received a polite invitation from Earl Fortescue to inspect his agricultural operations, the Great Western Railway brought me to Tiverton, from whence to Castle Hill is a pleasant coach ride of about 25 miles—quite a

treat on a fine day in these railway times. The beautiful Devonshire hills form a strange and pleasant contrast to our level eastern counties. Imagine an endless vista of ruined hills, like so many inverted wash-basins of all heights and sizes, presenting at every turn delightful undulating perspectives. Towering high on your left, in sullen misty grandeur, is Dartmoor, a wild waste of 250,000 acres, 800 feet high, frowning on you in the distance for several miles, like some dark cloud. On your right rises Exmoor, another extensive waste, less stern and elevated than its opposite neighbour, exhibiting occasionally on its bald surface the powdering of lime and cultivation. In fact, for 30 miles we see but hills and valleys; such is the country between Tiverton and South Molton. The first three miles from Tiverton is on the red sandstone, and exhibits generally good soil and careful cultivation, the watered and well-drained hill sides presenting an intense and pleasant verdure; but soon we pass to the cold and poverty-stricken clay slate, showing too painfully and plainly poverty and a low neglected state of cultivation and buildings. It is true, occasionally the eye falls on a verdant patch, indicating combined irrigation and drainage, but this is the exception.

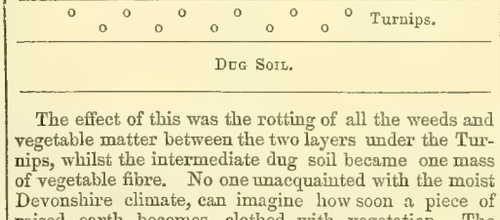
The most striking agricultural deformity is the miserably small dimension of the fields. From three-quarters of an acre to 2 and 3 acres is a common size. No doubt in a primitive pastoral county, without other shelter for stock, such enclosures were once found needful, but they must now give way to the introduction of a different system, or their occupiers will succumb, and the rental become depreciated. In fact one of the great wants of this district is accommodation for house-feeding, combined with drainage, irrigation, and Turnip growing. The clay slate, dirty white heavy unctuous clay, with tough and laminated layers cropping out on the sides of the numerous hills, keeps everything miserably wet. The climate, as may be supposed, from the physical character and conformation of the soil, must be mild and humid—the evaporation of the valleys and condensation of the hill-tops acting concurrently. In fact it is a Grass country, so far as the climate goes, but the absence of calcareous matter in the soil produces a coarse hassocky herbage. Owing to the extreme moisture, it is very difficult to eradicate weeds, especially as the soil is undrained, so Couch Grass reigns triumphant. Excess of moisture renders the growth of Wheat precarious; and I was assured that 12 bushels per acre was a common average. Successive crops of Oats are often grown, which I consider most injudicious, and in fact ruinous. Of course roots are seldom taken, as it would be impossible to feed or remove them without drainage. Some few attempts that met my eye looked abortive.

The beautiful North Devon cattle are seen to perfection, and deserve a better fate than eating Turnips on an exposed and wet pasture.

But there is great hope for this part of Devonshire. She has an unfailing mine of gold when worked. I mean the constant means of irrigation. Every hill supplies its stream, and if the land were drained, would be available on the catch-meadow principle for the production of the finest Grasses, which, immediately upon irrigation, supersede the coarse rushy herbage. Looking over an irrigated field, the intense green evidences unmistakeably the result, whilst any elevated portions that have not been covered, retained their rusty and worthless appearance. Our brother agriculturists who have never witnessed this operation, can easily appreciate the advantage of an abundant early feed of excellent Grass, fed to the middle of April, and then in six weeks a crop of 2 tons of hay per acre. I have no doubt if sheep were folded after hay time and fed with Rape cake, as is done by Mr. Pusey, summer irrigation might be available. The cost of the operation of catch-meadowing is seldom much more than 20*s.* per acre, with an annual charge of about 5*s.* Who would not covet such an advantage? and yet it is too seldom availed of, for want of drainage, which is an imperative preliminary, the soil being heavy.

I will now proceed to describe Earl Fortescue's improvements. His estate in that neighbourhood (South Molton), consists of about 12,000 acres, and partook of the general character. There were 72 fields on 126 acres of one farm; now only 12 enclosures. His lordship's own occupation consists of about 700 acres, which have been all drained under the Drainage Commissioners, superintended by Mr. Josiah Parkes. The pipes are placed 4 feet deep, at intervals of about 30 feet, and the drains answer admirably generally; but I am sure my friend Parkes will excuse me for saying there are several instances where the springs ought to have been tapped by deeper drains, so as to intercept their rising, and interfering with the surface water. The hills are full of springs rising up through the patchy and party-coloured soil, which varies from a dirty drab to an occasional dark, boggy, or silty, and sometimes yellow appearance. It is quite clear that these springs, rising up to the level of the drains, saturate the earth to a foot or two above them, by capillary attraction, thus preventing the descent of the rain or surface water. This was clearly indicated by the almost impassable and wet state of many of the fields. The same remark does not apply to the clays of uniform character, having no springs.

Those springs should certainly be tapped at deeper levels. As a proof of this the evil is not much felt in the spring or summer, when the springs are low. Another great mistake is the recommendation to lay such heavy land on the flat. I am aware that many of my Scotch friends, and my friend Parkes, too, have condemned my practice of using furrows at intervals of every 7 feet; but experience has taught me its advantage, and that our county of Essex is right in this respect.



My own prejudices were originally strong against the system, but a trial of one acre on each field soon settled the question, and convinced me of my error. The fact is, however well drained heavy land may be, its physical and chemical character will not permit a percolation or permeation of the winter rains so fast as they sometimes fall. The open furrows here come in aid as auxiliaries, and prevent the bursting of the seed by stagnated saturation. This was forcibly evidenced by a griped field at Earl Fortescue's, from which the water was rapidly passing away on the grips, the sub-drains also acting profusely. This field was infinitely drier than the adjoining ones. The cutting of these furrows does credit to Mr. Graburn's sound judgment in the matter.

I hope your correspondents will discuss this question of open furrows, for it is a most important one on heavy land. I shall revert to it some day. His lordship has enlarged the fields by the removal of useless fences. The management of the farming operations, as well as the planning and erection of the buildings, machinery, &c., have been intrusted to Mr. Robert S. Graburn, of Butleigh, Glastonbury; and, in my opinion, are perfectly sound and business-like, in almost every respect. The most striking evidence of this was his first providing accommodation for house feeding an immensely increased head of stock, and concurrently and cheaply providing an abundant supply of winter as well as summer food for them at a very moderate cost. The result of this will be a permanent increase of manure, cultivation, and production. The administration of the food, when grown, is equally judicious and economical—greater results might have been produced by greater expenditure, but his lordship most judiciously determined to trust most to cultivation, and those economical means, the employment of manual labour within the immediate reach of small farmers, rather than to an extraordinary outlay for purchased manures.

I consider the raising of 120 acres of good Swede Turnips, Mangold, &c., on a heavy land, that had never before produced them, quite a triumph; and this without much expensive cultivation on a previously exhausted, and indeed partly deserted soil.

Let us see how this was done:

In some cases, where the surface, after drainage, was one mass of accumulated weeds, Grass, Rushes, &c., a spit was dug from the surface, and the grassy side placed on the surface of the undug ground next to it, thus raising a terrace, as it were, or an embankment, 27 inches wide, on which the Turnips were to be grown. Another spit was then dug and turned over, not removed, so as to aerate the soil and facilitate the descent of the water through this adhesive clay.

The effect of this was the rotting of all the weeds and vegetable matter between the two layers under the Turnips, whilst the intermediate dug soil became one mass of vegetable fibre. No one unacquainted with the moist Devonshire climate, can imagine how soon a piece of raised earth becomes clothed with vegetation. The ridge is, after the removal of the Turnips, split or turned over, nicely clean, on the dug furrow, ready for another crop of Turnips, similarly treated, or for a Corn crop, according to the state of the land.

The cost of the double trenching above described is, I think, 3*l.* per acre. But methinks I hear some of our friends, who plough six or eight times for Turnips, inquire, Where is your fine seed bed?

Now comes Mr. Graburn's strong point, borrowed from Mr. Huxtable, and improved upon. It is certainly a most admirable one, judging from the results. One man having a dibbler of the ordinary form, about the size of half a large Pine-apple, presses his foot on it, and leaves a hole large enough to contain one pound or pint of animal excrement (free from straw), a woman follows with a box of manure, and a half circular trowel, which contains just a pint of manure, which she deposits in the whole made by the dibbler. Another woman, with a supply of superphosphate of lime mixed with fine mould or ashes, uses a large extinguisher, with a handle, which she presses into the dung, and then empties its contents into the opening made. This extinguisher contains three drachms of superphosphate of lime mixed with fine earth and ashes. A child then follows and deposits a pinch of seed in the seed-bed of the extinguisher, pressing it gently in, and, if the adjoining earth is fine, pushing a little over it.

The combined operations, though tedious in description, are rapid and easy, as I can testify. The result is an unfailing plant of either Mangold Wurzel or Swedes, without regard to the condition of the surrounding soil or weather. The seed bed derives moisture from the manure, and the plant having its food at immediate command grows rapidly and luxuriantly. The cost of the operation is from 7*s.* 6*d.* to 10*s.* 6*d.* per acre. There will be about 17,000 plants to the acre, so 17,000 lbs. or pints of dung will be between 7 and 8 tons of dung per acre, and 3 cwt. of superphosphate of lime. I should say that a cross piece on the dibbler serves to mark the distance for the next dibble hole. The hand and horse hoe may be at once employed, and I shall certainly practise it, especially after Tares, in dry weather. If the land is in stetches it would be desirable to mark the lines with the drill where no manure could be spared; the mould and superphosphate were alone used, at a cost of 20*s.* per acre. *J. J. Mechi.*

(*To be continued.*)

## ENGLISH AGRICULTURE—1851.

As in all probability the approaching Exhibition will bring together a vast number of persons from nearly all the civilised nations in the world, a great effort will doubtless be made by each to excel the others in the productions of manufacture, commerce, arts and science, and also agriculture. Surely then, England, the projector of the great design, will make a strenuous effort to stand foremost in the ranks.

It must be admitted that agriculture is to England as well as to most nations a subject of unquestionable importance, and one upon which their prosperity greatly depends. For some years past ingenuity and mechanical skill have been at work; numerous valuable and useful implements have been invented, science and art have rendered their important assistance, great theories and principles, the result of chemical investigation, have been submitted, publications have issued from the press of a most useful description, developing various subjects and diffusing light and knowledge; numerous meetings have been held, and many practical suggestions made. But the great question naturally arises, Have the practical farmers of this country properly availed themselves of these things? Have not a considerable majority only heard of this, and not attempted to carry it out? Such truly is the character (in too many instances) of the English farmer, that he appears to be bound by a certain set of fixed notions to follow in the footsteps of his ancestors, whether they are right or wrong; and pursues an undeviating course of old customs, quite regardless of the consequences, without even taking the trouble to inquire into any new suggestions or ideas which might, if adopted, essentially conduce to his prosperity. At many of the Agricultural Associations, at Farmers' Clubs, and also in able treatises, great and important principles have been propounded, their adoption urged, their utility explained; but in how few instances are they practically carried into operation? There may be, generally speaking, some want of enterprise and persevering skill in the English farmer, but in most instances (especially now that a low remuneration awaits him) it is his limited means, his want of ample capital, as well as inclination, which cause his apparent apathy, his tardy movements, in attending to those matters which would be most desirable, and conduce to his prosperity; consequently the various theories and suggestions which have been made have only been partially carried into effect, and in comparatively few instances by the practical man, who depends upon his business for his maintenance. True it is, there are some persons of enterprise, capital, and skill, who have availed themselves of some of the circumstances alluded to, who have adopted a judicious system of cultivation, attending to the suggestions made by others, and who have reaped a considerable harvest of profit from it. But the surprise is, that in the present state of agricultural depression, when the farmers of England are scarcely in a position "to make both ends meet," that they do not awake from the seeming lethargy in which they are, and make a strenuous effort, while so many plans and notions are before them, and which, they are told, will enable them to produce a much larger quantity of corn from the same number of acres, and at about the same cost. The man of commerce, the manufacturer, and the tradesman are always alive to the circumstances and events of the day; and are ready to avail themselves of any new idea, or fresh suggestion, and at once endeavour to carry them out, when it is frequently attended with the desired success. But in too many instances the farmer continues plodding on, in one continuous course of uniform practice, just because his grandfather did so before him, and his ancestors a hundred years ago. Probably some of the new systems and plans which are suggested may be vague and visionary, attended with much risk and improbable success ultimately, expensive to carry out, and require a large amount of theoretical as well as practical knowledge and experience, with an additional quantity of implements, and a much larger amount of capital; all these things may place it beyond the reach of the generality of farmers, but, on the contrary, some things are simple and easy of adoption, within the reach of most, and only require the inclination to commence, and the perseverance of the farmer to carry them out. There cannot be a doubt that the soil of England (with its climate) is capable of producing a much larger quantity of corn than has ever yet been the average growth; and as this is a matter of vital importance in a national, as well as every other sense, surely it is most desirable to ascertain, if possible, how it can best be accomplished, and how England can be placed in fair competition with the corn-growing nations of the world, for with all these she has now to compete. How the British farmer, with his present rent, taxes, poor-rates, tithes, &c., with numerous expenses, can be in a position to grow corn with foreign nations, and surrounded by all his difficulties, continue to maintain

the honourable character of an English farmer, which has always been the pride and boast of the nation. This may be a difficult question to answer, still, perhaps, it may be accomplished, and it may be worth while to look seriously at the subject; and the question may be asked, Has a fair trial yet been made? Have the various theories, systems, and plans, which have been propounded, as the result of scientific research and investigation been properly tested, and carried into operation, or have they only been partially and incorrectly attended to; probably in some few instances they may have been and now are carried out, though only to a very limited extent, and certainly not sufficient to afford a fair and suitable trial. Agriculture, unlike the other great concerns of the empire, requires a considerable time to test an experiment properly. Time alone will do it; it has to contend with the changes of seasons, and various and numerous contingencies and circumstances which no earthly power can control, and which some unexpected and unlooked-for occurrence may prevent success for a season, when probably it might answer well another year and the like disappointment not again happen. Thus time, patience, expense, and perseverance are required. But the practical farmer will exclaim, How can I do all this? I cannot afford it; I depend upon my year's produce to meet my unavoidable expenses, and therefore I am not in a position to experimentalise, as probably I may meet with disappointment, and not succeed. All this is correct, it becomes a question whether the dependant farmer is the person to run the risk of testing experiments; who then is to do it? If it is admitted that agriculture is of so much importance to the welfare of the empire, and if the farmer is to maintain his position amidst all the difficulties with which he has to contend, surely it becomes a serious question who is to try these schemes, who is to carry into effect the theoretical suggestions now before the world properly and fairly, and thereby ascertain whether they will answer the purpose or not, and remunerate the farmer who depends upon his business for his support, and who doubtless would avail himself of them if the fact could be demonstrated that they were worthy his adoption.

Is the landed proprietor, then, the proper party to look into the matters, or must it be done by some public or national institution? The subject requires to be seriously inquired into, and ample resources must be appropriated to the purpose of giving the new schemes a fair and proper trial, in order that those which are vague and visionary may be abandoned, and those which are worthy of adaptation recommended to the farmer from a source upon which implicit confidence may be placed. Some of the following important items, for the improvement of which many suggestions have been made, ought to be attended to, viz.:—The best system of drainage; management of manures, farm-yard, liquid, and chemical or artificial; the possibility of advantageous continual cropping, and discontinuance of long fallows; steam machinery, and selection of suitable implements; subsoiling, ploughing, &c.; thick or thin sowing; rotation of crops and cultivation of root crops; management and selection of live stock, and the means of keeping an additional quantity; economy of labour of all descriptions; agricultural chemistry; proper management of accounts, and result of experiments.

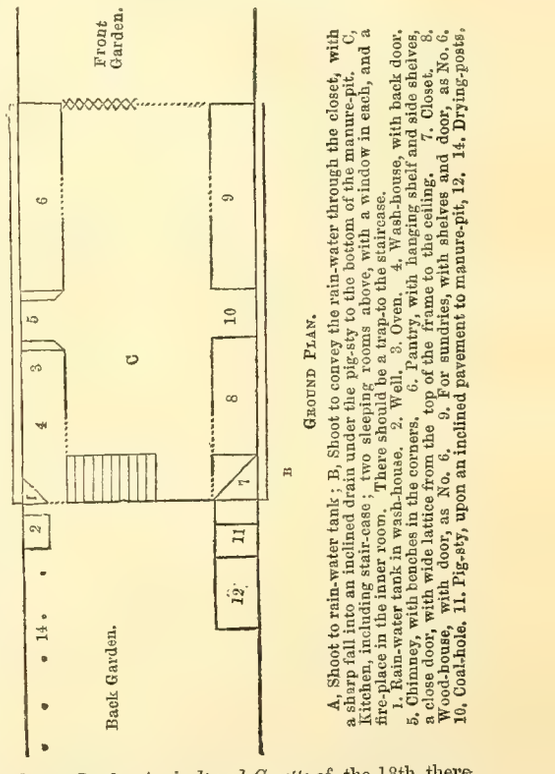
Many items in the above enumeration, even at the present period of what is called agricultural improvement, are only known theoretically, and consequently have been but little tested by the farmers, and chiefly because so few of them can afford to do it; but were they properly and carefully carried out, and their utility in a remunerating sense demonstrated, no doubt numbers would gladly make strenuous efforts to adopt them.

As regards the present system of drainage, the introduction of what is called artificial manure, the preservation of the liquid drainage of the farm-yard—subsoiling, thin sowing, agricultural chemistry, steam machinery, &c. They appear to open a new era in English agriculture, and are subjects which demand diligent and serious attention; for if by some of them, together with a judicious system of rotation in cropping, the land can be continuously at work instead of reposing for a year under the burden of all its expenses, and producing no return, a most important object will be attained: and as much light is now let in upon the subject by chemical applications, chemistry can lend her invaluable aid, and suggest the best methods of freeing the soil from the remains of a previous crop. By the use of some of the valuable implements now invented, a great deal may be done both during and after harvest to restore fertility to the land, and which will be greatly promoted by its exposure to the winter season. At this serious but important period of English farming, it behoves all whom it may concern, properly to consider what can best be done—what are the most prudent measures to adopt, and to avail themselves of any well tested theories or suggestions which may assist them.

As regards the very important subject of live stock, it seems to be quite a question whether it has been discussed as it ought to be in this country. In some instances much care and judgment are shown in endeavouring to produce a superior breed of animals; and many are to be found of perhaps almost unequalled quality. But it is not carried out sufficiently. As well may a farmer breed a superior animal as one of an inferior description. And why not to a much greater extent than now. And instead of putting himself in considerable difficulty to raise a sum of money to purchase his cattle at the fair or market, why is he not to look to his own resources—to his farm for them? With judicious management stock may be reared without much discoverable outgoing in the way of payment; and when ready for sale a convenient amount may be received. Truly much attention has been paid to this subject during the past few years, and some advances have been made; but it has not yet been done to a sufficient extent. Has there been as much stock produced as might have been? and do the farmers keep a proper quantity? Upon investigation it would be found there is a great deficiency. This is a subject worthy of serious consideration. Certain it is that in this country a splendid breed of animals is to be found, such as no other country can produce; but it is not universally spread, and while the nation must commend the persevering industry and consummate judgment of those whose names might be recorded as the breeders of various animals of real excellence, and almost perfect symmetry, it is to be regretted that the numbers are so limited. An inferior animal is as costly to keep as one of the best description, and perhaps more so. And as the live stock upon a farm is a subject of vast importance, not only in itself but as regards the productiveness of the land (as much depends upon the stock which is kept upon it), the subject altogether demands more attention and consideration than has yet been bestowed upon it.

The object of this paper is to call the serious attention of those who are interested in British agriculture to its position at the present serious crisis; to arouse the farmers of England to consider their situation and the circumstances by which they are now surrounded; and to enquire whether anything can be done to improve it which is tangible or practicable. Certain schemes may be concocted, principles and theories laid down, and numerous suggestions made; but it ought to be known by some means, from a source upon which dependence can be placed, whether they will ultimately answer the purposes and ends which the practical farmer needs, and therefore be desirable for him to adopt them. One may say he has tried this scheme and another the other, and that it has answered well; but the important result in the form of a balance-sheet is not forthcoming, and this is a main object of attainment so far as the practical farmer is concerned. Another may say he has pursued a certain system, but it was only on a peculiar piece of land, and under some peculiar circumstances; while others may have attempted to carry out experiments, and have either failed in the attempt or not submitted the results to the world.

In order fully to appreciate the value of what has been published, and in other ways brought before the farmers of England, they ought to have some data to refer upon which they can implicitly rely—a comprehensive, yet simple detail of facts, the result of experiments superintended by competent skill and knowledge, that the business calculations may be arrived at, and then the farmer may know whether it is worth his while to adopt them upon an extensive scale. *J. Low.* [The thing is impracticable; the data desired, whether furnished by some public institution or not, would be true only of the circumstances under which they arose. And the results of individual experience, on which we now depend, are trustworthy just in the same degree, be it great or small, as those of any public institution whatever.]



## Home Correspondence.

*Test of Manures for Turnips.*—I send you the following particulars of an experiment on 7 half acre lots of Swede Turnips, grown on a poorish sandy loam, in a second-rate climate, on high land, in North Staffordshire, at the cost of 25*s.* for the different manures applied to each half acre: (Skirving's seed) sown the 20th June last, in ridges 28 inches apart, hoed out to 14 ins. in the row, taken up the 3d inst., tops, roots, and dirt taken off, and weighed in the field. My practice has generally been to apply 12 tons of good farm-yard manure, and 2½ cwt. of Peruvian guano to a statute acre; this dressing I value at 3*l.* 13*s.* Ridged and separated as above, and in the same field adjoining the experimental lots, sown June 19; taken up and weighed the day the lots were. The return on that acre was 23 tons 3 cwt. 2 qrs. 15 lbs. I give the weight of each lot, as if grown on an acre, at the cost of 2*l.* 10*s.*

*Remarks.*—Lot No. 1 made a bad start, and continued in that state three months, when 43 of the plants threw out no bulb at all, but produced a stalk and top, the stalk like an Ash tree root, and the top like a Gooseberry bush. The stalk was so fast in the ground that a stout young man could not pull it up without the aid of a fork. As I have no experience in this extraordinary production, perhaps some well-wisher to agriculture will give you a cause for it. There were only three of these bushy plants to be found on lot 2, not one in the field besides. This lot came badly at first, and made but little progress till October—then grew fast. No. 3 started rather slowly at first; like No. 2, came up well at the latter end. No. 4 started well at the end of the first month, was ahead of the others, and continued so. No. 5 came up weak at first, at the end of three months was a fair competitor with lots 2, 3, and 4. No. 6 was a good while in the ground; when up made slow but steady progress. No. 7 was long in the ground, and when up, at the end of two months was weak and stunted; some died away. A few only of good Turnips were to be found when taken up. The land was all of equal quality, and the dressings were deposited by hand. *J. C. Etches, Harly Thorn, Stone, Staffordshire, Jan.* 22.

*Cottages.*—As you have often kindly attended to hints of mine, I venture to send for your *Gazette* my plan for a labourer's cottage; you will at once see that it meets all their wants, and I know all their wishes too. I grieve to tell you, that they only fear that it will be thought too good for them. I have forwarded a copy to the Agricultural Society, and one to the Marquis of Londonderry, and others, so that if you will insert it in your universally approved paper, it may not require more publicity from me. *One who is too often a grieved witness to the unworthy Cottages of the Poor.*

Ground Plan.

A, Shoot to rain-water tank; B, Shoot to convey the rain-water through the closet, with a sharp fall into an inclined drain under the pig-sty to the bottom of the manure-pit. C, Kitchen, including stair-case; two sleeping rooms above, with a window in each, and a fire-place in the inner room. There should be a trap to the staircase.
1. Rain-water tank in wash-house. 2. Well. 3. Oven. 4. Wash-house, with back door. 5. Chimney, with benches in the corners. 6. Pantry, with hanging shelf and side shelves, a close door, with wide lattice from the top of the frame to the ceiling. 7. Closet. 8. Wood-house, with door, as No. 6. 9. For sundries, with shelves and door, as No. 6. 10. Coal-hole. 11. Pig-sty, upon an inclined pavement to manure-pit, 12. 14. Drying-posts.

*Sheep.*—In the *Agricultural Gazette* of the 18th there is a "Village Lecture" on sheep. The lecturer has given a fair description of what the southdown was, but of late years the character of this animal is very much changed. It is rare now to meet with a pure southdown of the Sussex breed; the farmers have, by high feeding, and by crossing the breed with what are termed Hampshire southdowns, changed their character so much that they scarcely deserve the name. The reason for this change, I believe, is the profit which the farmer derives from increased size, and from the increased quantity of wool they yield; it is true the wool formerly was finer, and was generally worth more in the market than coarser kinds, but this is overbalanced by the quantity of wool and extra weight of the sheep. As a manufacturer, I regret this circumstance, because the wool of this coarse heavy breed is ill adapted to the use which it was formerly put to. I am not quite sure, but the farmers may ultimately beat themselves by the change, because we are compelled to use colonial and foreign wools instead, which would be prevented if we could get fine English, as formerly. Australian wool will have a tendency to go up in price, while the other will naturally recede, for want of more extensive consumption. *J. J. F.*

## Societies.

Highland and Agricultural, *Jan.* 8: *The Best Mode of Preparing and Applying the different Manures produced on the Farm.*—Mr. Finnie, Swanston, said: I will arrange my observations under two heads:—first, the preparation; and, second, the application. In treating of the preparation, I am naturally led to refer to the sources from which it is obtained; and these are found to be from horses, cattle kept for either dairy feeding or rearing purposes, and pigs; the second mentioned live stock, being kept in open courts, byres, or boxes, as the practice of the farmer may be. The two leading general principles, which, from experience and observation, I hold to be essential for the most profitable practice are—first, to have the whole dung that is daily removed from the bestial kept on the farm, carefully collected into one place, regularly mixed, and, at the time, adding such other earthy or vegetable material as is necessary to absorb the excess of liquid that exists. Secondly, to preserve the dung-heap during the process of collection, preparation, and prior to application, as much as possible, from the effects of the atmosphere, and this both in winter and summer. To follow out these principles in practice, it is requisite for every farm to have a convenient and well-formed dung depôt, with liquid manure tank attached, provision being also made for the liquid manure, as it comes from the animals kept in houses, not mixing, in the first instance, with their

solid excrement, but conveyed under-ground direct to the spot where the manufacture of manure (as it may be termed) is to take place. To lay down any one plan for the construction of every dung depôt, would be injudicious. But, by way of illustration, I shall suppose a case, and assume it to be formed where the ground is level, and at a lower elevation than the steading. Under such circumstances, I would excavate a space sufficiently large to admit of it holding a half more dung than what can possibly be accumulated, say for one half year, at least, from the sources I have referred to, wide enough to admit of a cart turning in it with ease; the depth from the surface, when completed, may be from 3 to 4½ feet or more. On three sides a retaining wall, and at one end the outlet, with such a gradual slope as to allow of well laden carts being taken out. If the soil is retentive, little provision need be made for preventing the liquid oozing from the dung escaping; but if porous, the retaining walls should receive one foot of clay puddle behind the building; the bottom of the depôt should be covered with a similar thickness of the same material, and, upon the top of the latter, one foot of well broken road metal, to give solidity for cartage. A very simple plan for allowing the horses to get out with ease, is to lay a tramway of flat stones. This, I may say, completes the formation, unless the preferable mode of having a covered depôt is adopted, which in passing, I may remark, is likely, ere long, to be considered an essential building for every farm. So far, therefore, for the reception of the solid manure. I shall now state what appears to me a simple process for conveying the liquid portion to the depôt; and I am glad to say the old and expensive mode of constructing drains of mason work may be entirely superseded by the use of circular clay pipes, 3 feet long, with spigot and faucet joints, made to any bore, from 2½ to 3 inches will, I think, be found sufficient for such a purpose as I am speaking of. At the extremity of each house where live stock is kept, or any other more convenient spot, where the liquid will readily run to, as well as at the lowest point of every yard and part of the steading, where the liquid worth preserving accumulates, there may be formed a small cesspool, say from 20 inches to 2 feet square, and about 30 inches deep, and which may even be made by sinking old herring barrels (costing from 9*d.* to 1*s.*) puddled round the sides with clay, and the bottom embedded in it; the tops of these cesspools kept sufficiently below the level of the adjoining surface as to admit of a stout flag with iron grating on hinges, in its centre, first to admit the liquid, and secondly to provide for the cesspool being emptied of any sediment, which, when attended to, no danger exists of the pipes silting up. When such a distance from the top of the cesspool, as will admit of a sufficient covering for the pipes, a hole is made to admit one end of the circular pipes, which are laid to connect these different tanks (as they may be called), together, and ultimately discharging from the one, on the lowest level into a trough, which may be made of wood, say 15 inches deep, sloped to 20 inches at the top, placed at the side of the dung depôt, equidistant from each end of it when taken lengthways, and sufficiently long to admit of the urine being scooped out over any part of the accumulating mass, the latter having likewise an overflow pipe unto the manure tank or liquid reservoir, as also there being a connexion between the lowest part of the dung depôt and the manure tank, which can be opened or cut off at pleasure. I already mentioned that the liquid manure from the cattle kept in houses should not be allowed to mix in the first instance with their solid excrement. I shall briefly explain how this may be effected. About 20 inches from the gutter behind the cattle, and parallel to it, let a continuous opening be made, extending right across the different cattle stances, sufficiently deep at first, to admit some inches of clay in the bottom, upon the top of which the common horse-shoe drain tiles, in size from 3 to 3½ inches, are laid upon their back; these are supported on each side by a common building brick on edge or small thin flagstone, which projects about 2 inches above the tile, and reaches within 1½ or 2 inches of the causeway. A plank perforated with holes in the centre is made to fit in and rest upon the bricks or thin flags, and when in its place is level with the rest of the causeway, and forms part of the standing room for the cattle; when the animal stales, water at once finds its way into the tiles, and by them it is conveyed to the first small cesspool. No doubt this arrangement does not suit for either dairy stock or when queys are fed, but the same provision may be made on the side of the gutter or in its centre. I will not trouble you with any observations as to the construction of the large liquid manure tank, with which you are all familiar. Having now provided for the reception of the dung, both solid and liquid, I shall in a word or two explain what I would propose to mix with, in order to absorb the urine. On all farms where moss (peat) can be procured, and care taken to have it turned over, and exposed to the atmosphere in dry summer weather, no better absorbent can be got. In the absence of peat there are, generally speaking on the majority of farms, high head ridges or other accumulations of earth, and when these are exhausted, I would be disposed to recommend the use of any earthy material, even although it should not be soil of the best description. In fact, pure clay, when turned over in dry weather and exposed to the atmosphere, will prove not the least valuable for such a purpose. I need not add, that whatever is used to supplement the dung-heap should be carted home in summer, and stored as close to the dung depôt as possible, so as to be ready for application when required; rack (seaweed) or any other decaying vegetable substances may be all set aside for the same end, as one or two good soakings of the urine will soon extinguish any vegetating tendency it has. The process of manufacture requires few remarks. In the first instance, the bottom of the depôt receives a covering of from 12 to 16 inches of the absorbent, and as the byres and stables are emptied, and the dung from each properly mixed and spread, a thin covering of the absorbent is given, and then the whole saturated with the liquid that has gathered in the trough already referred to, the absorbent serving the double purpose of both protecting the manure daily obtained from the horses and other cattle, not only from the effects of the atmosphere, but also for absorbing the liquid which the same could not otherwise retain. Such being the case, the quantity of absorbent used must be so far regulated by the liquid at command. The mass goes on thus increasing, until it is either turned over to be applied directly to land, or carted away to be stored for after use. When the latter takes place, I would recommend that the bottom of the stance where it is intended to be laid, should receive a covering of earth or of what is in general used for absorbing the urine, and then if manure has been accumulating in boxes, or carts, or piggeries, let it be regularly mixed with what is led out from the depôt, layer about. When manure is intended to remain any time in middens on the fields, it is always desirable to have it carted upon them while these are forming; this prevents premature decomposition, but often this is not practicable, from its being so far decayed, before removal from the steading. It should, however, whether carted or not, have the sides and top well covered with some earthy substance to preserve it from the action of the atmosphere.

*On the application of Manure.*—Dung, when applied to land to be immediately sown or planted, should invariably be in a state to afford instant food to the plants, or, in other words, well rotted. When applied to land not to be sown or planted for several months afterwards, little previous decomposition is necessary, that had better take place in the soil itself; and the land will work more freely in the spring when it does so. At whatever time, or for whatever purpose, it is applied, it ought to be well soaked with urine previous to being driven out; or in the absence of urine, common water may be used, and the less time that elapses between filling at the dung heap, and covering it with the plough, the greater will be its effect, and particularly when put into the drill in spring, the Turnips never fail to braird well, and the Potatoes withstand drought better. I have found much benefit result from attention to these rules. I have an idea which I propose acting upon, having tried it already on a limited scale, of raising my Turnip crop entirely with portable manures, but before sowing my Barley and Wheat, to give a proportion of farm-yard manure. My opinion is, that by being a little liberal with the portable manures, I can raise a sufficiently bulky crop of Turnips, and by applying the farm-yard manure after these are either eaten, in whole or in part, by sheep, or removed entirely, I will ensure better Grass and succeeding crops, in the rotation—of course, apportioning the dung under these different systems accordingly. My former practice has been to give the proportion of farm-yard manure, viz., 20 tons, in ploughing over the stubble, adding in addition in spring, upon sowing my Turnips, 5 cwt. of guano per Scotch acre, or some other mixture of the portable manures; but I think less of the home-made manure, viz., 12 tons, under the new system, will be attended with more beneficial and profitable results. In the former case, suppose,

| | | | |
|---|---|---|---|
| 20 tons of manure, at 7*s.* per ton ... ... | £7 | 0 | 0 |
| 5 cwt. guano in spring, at 10*s.* per cwt. ... | 2 | 10 | 0 |
| | | | £9 10 0 |

In the other view,

| | | | |
|---|---|---|---|
| 7 cwt. guano in spring, at 10*s.* per cwt. ... | £3 | 10 | 0 |
| 12 tons manure when grain crop is sown at 7*s.* per ton ... ... ... ... ... | 4 | 4 | 0 |
| | | | 7 14 0 |
| Difference ... ... ... ... ... | | | £1 16 0 |

I am prepared for the remark, "This is expensive manuring," but my experience and observation lead me to the conclusion that, taking the soil and climate of Scotland as a whole, it will be found that in proportion to manure used, will be the produce obtained; and however expensive it may be to secure it in sufficient quantity, we farmers need never flatter ourselves into the belief that whether we drain, subsoil, or have recourse to other methods for changing the character of the land, a liberal supply of manure can be dispensed with, but under very rare and peculiar circumstances. Previous to the existence of that calamity, which has, to so unprecedented an extent, interfered with the Potato culture, the practice was, and found beneficial, to apply the dung for that root almost exclusively in spring. Experience seems to show, however, that the tendency to disease is aggravated in proportion to the quantity that is placed in immediate contact with the sets. It is accordingly safer either to apply the whole in autumn, or at least two-thirds. The proportion, therefore, ploughed down with the stubble requires little previous decomposition; but what is put into the drill ought to be in a very advanced state in that respect. A portion of guano proportioned to the quantity of farm-yard manure used has been attended with good effects. The use of liquid manure in the liquid form I have practised to considerable extent, and although I do not undervalue its effects, and would just do what the Messrs. Harvey of Glasgow have done, had I the same inexhaustible supply, and even adopt other modes of irrigation, if practicable and profitable, still I would say applying it in the solid form, such as I have described in treating of the preparation of manure, will be found most beneficial to the farmer whose resources for obtaining it are, comparatively speaking, of a very limited description. It has various drawbacks when carted out in the liquid state. In wet weather the Grass is poached, and if applied in frost or dry weather, it produces little visible effect. In short, now that we can command such stimulants as nitrate of soda and sulphate of ammonia, I would almost conclude that these in a great measure supersede the necessity for applying it to the surface in the liquid form. All I contend for is this, that the management of manure should be conducted under the great leading principle of converting as much of the liquid into solid as possible, and as little of the solid into liquid; and this I will further maintain that whether or not it is expedient to manufacture dung occasionally in the field, it is absolutely necessary to have a regular depôt for solid and liquid manure at the steading, and also to practise a methodical and systematic way of daily collecting into it what requires to be removed from the live stock. The very use of such a means tends to other improvements about the farm. For I would wish to ask any one who has been obliged to force his way through accumulations of dung at stables and byre doors, whether or not he ever found the interior of these houses either clean or the cattle kept in them so, and, upon examination of the horse-dung heap, failed in nine cases out of ten to find it fire fang (an expression familiar to all farmers), and that of the cows sending from it a stream which, from its odour and colour, gave certain proof that the essential elements of the dung were finding their way by the readiest outfall to the nearest rivulet, or otherwise disappearing, to the loss of the farmer. — Mr. Main, Whitehill, Mid-Lothian, in the course of an interesting address, stated in reference to the application of home manure: I am aware that it is the practice of many of our best agriculturists to apply their manure in autumn. I have done the same for experiment, and have seen others do it, but I have found the crop manured from the heap, though exposed the whole winter, to be greatly superior to the autumn applied dung, and I have now given up the practice. It is true, when a large quantity is applied, say 40 or 50 cart-loads, necessity may compel a portion of it to be given in autumn; but it may be questionable whether a smaller quantity, with an addition of guano applied in the spring, would not be of equal, if not greater advantage. A neighbour of mine, a few years since, told me he was going to try autumn manuring. On my recommendation, he did only the half of his field in autumn, and the other half in spring; the crop was Potatoes. The result of the experiment was, that he never tried autumn manuring again. Still I would not condemn the practice. I only state my own experience, and what I have seen in the case of others. The state of preparation in which manure should be applied is a question of considerable interest. From the results of my experience this year, I am disposed to think that manure does most for the benefit of the immediate crop, at least, and I should think for succeeding crops too, when it is applied in a recent state. I never had such a crop of Potatoes as I had this year, from manure applied in this way; and it appears to be equally applicable to Turnips. The following is an experiment I conducted this year, to determine this question. The field was a light sandy loam. The manure prepared exactly in the same way from cattle fed on oilcake and Turnips, the only difference was, the one lot was manured from a heap thoroughly rotten, and which had lain for four months in heap; the other lot got manure taken immediately from the cattle courts. Each lot got at the rate of 28 cart-loads per imperial acre. The results are as follows, showing a distinct advantage from the use of recent manure:—

| | Produce. tns. | cwt. | lb. |
|---|---|---|---|
| Rotten Manure, in heap 4 months, 28 carts per imperial acre, ... ... ... ... ... ... | 21 | 5 | 28 |
| Rotten Manure, as above, 20 carts per imperial acre } Peruvian Guano, 64 lbs. per imp. acre ... ... } | 21 | 0 | 84 |
| Rotten Manure, 12 carts per imp. acre ... ... } Peruvian Guano, 128 lbs. do. ... ... } | 20 | 17 | 105 |
| Rotten Manure 12 carts do. ... ... } Peruvian Guano, 228 lbs. do. ... ... } | 21 | 13 | 14 |
| Recent Manure from courts, 28 carts per imp. acre | 21 | 18 | 84 |
| Rotten Manure, 12 carts per imp. acre ... ... } Nitrate of Soda, 202¾ lbs. do. ... ... ... } | 17 | 6 | 56 |
| Rotten Manure 12 carts do. ... ... ... } Peruvian Guano, 328 lbs. do. ... ... ... } | 20 | 18 | 56 |
| Rotten Manure, 12 carts do. ... ... ... } Nitrate of Soda, 291¾ lbs. do. ... ... ... } | 18 | 8 | 49 |
| Rotten Manure, 12 carts do. ... ... ... } Hen Manure, 5 cwt. do. ... ... ... } | 19 | 13 | 84 |

The best return from the mixture of guano with farm manure is from lot 4, where 12 carts of manure are aided by 228 lbs. of guano. This application results in 13 cwt. 56 lbs. of Turnips, over the crop manured with 28 acres of rotten home manure alone. In lot 7, where the 12 carts were aided with 328 lbs. of guano, or 100 lbs. more than lot 4, the result is not so favourable to the guano. I attribute this to an over dose of guano, without an equivalent increase of manure. The power of the guano was expended in the production of shaw to an extent, out-running the capability of the small quantity of manure applied, to equal it in growth of bulb. I have no doubt, that had I applied a few cart-loads additional, the result would have been very different. It will be seen, however, that the recent or green manure is the most productive manure of the

experiment. I applied the nitrate of soda in opposition to guano, apportioning the application of both substances to the equivalent of the nitrogen in each. But if my calculations are right in respect of nitrogen, the guano is decidedly superior. It is right, however, to state that the drought seemed to affect the nitrate to a greater extent than the guano. After rains came, the crops from the nitrate made the greatest amount of progress, but too late to be of much service, at least, in overtaking the guano. The auxiliaries of application is perhaps the greatest question of the day connected with the economy of farm management. My own experience is all in favour of using guano and other foreign substances in connection with farm-yard manure. Not only do we effect a saving in expense, but we are enabled to grow a large breadth of Turnips or Potatoes, and by intermixing sheep husbandry with our management, we do equal, if not greater justice to our soil. But instead of enlarging, I prefer to give an experiment of this year, which very clearly shows the advantages of using guano. The mode I adopted in this experiment was to determine, as nearly as possible, from authority, the quantity of nitrogen in home manure, and, by withdrawing a proportion of this from each lot, to supply it in the form of guano. In consequence, my quantities of manure are not exactly what I generally use. I prefer giving not less than from 16 to 20 cart-loads of manure. The field is the one already alluded to. The results are as follows. The experiment decidedly proves the advantages of using guano in connection with farm-yard manure. As I have already said, however, I prefer giving a larger quantity of home dung than 12 cart-loads. My usual quantity is from 16 to 20 carts of dung, and from 3 to 5 cwt. of guano. For raising Turnips, bones dissolved are quite equal to guano ; but I prefer a mixture of the two substances. — In answer to a question by Mr. Balfour, Mr. Main explained that the rotten manure referred to in his experiment was not turned over previous to applying it to the crop. It had lain in heap for four months, and cut quite rotten in the spring. He did not consider it necessary to turn it over.— Dr. Anderson said : He agreed with the opinion of Mr. Finnie, that the plan of absorbing the liquid manure by some substance capable of retaining its valuable matters, and then applying it to the soil, as a general rule, would be found more practically applicable than the many plans proposed for distributing it in the liquid form. No doubt instances existed in which its application, by means of pipes distributed over the farm, might be, and he believed was, employed with profit ; but these were exceptional cases, and he was of opinion that the plan could never be advantageously applied to the general husbandry of the country. It could, in fact, only be used where the circumstances of the farm were such as caused the production of what he might call a disproportionately large quantity of liquid manure, such as would admit of its application in large quantity at any time. In an ordinary farm, producing the ordinary amount of liquid manure, he believed that the benefits derived from its application were not likely to repay the large outlay required for pipes. He believed, in fact, that, as often happens when matters have been altogether neglected, and then brought prominently into notice, that there was rather a tendency to over-rate the value of liquid manure. He trusted that in this statement he would not be supposed to wish to depreciate this manure, but rather to guard against an over-estimate of its worth. It ought to be remembered, that the amount of ammonia in liquid manure was very small, and that in phosphates it was entirely deficient, so that it could never be relied on alone, but must be conjoined with a certain proportion of the solid manure. Mr. Finnie and Mr. Balfour had referred to the increased value of the manure made under cover over that made in the ordinary way, and that was a point in which theory strongly supported them. Curiously enough, however, we were remarkably deficient in experiments, to show their relative values. He knew, indeed, but one experiment on the subject, which was made on the home farm of a very zealous and active member of the Society, Mr. Campbell, of Craigie, in which two different quantities of Turnips were grown with manure made under cover, and one with it much in the old way, and the result was, that no appreciable difference existed between the two crops. He must say, however, that that experiment did not by any means exhaust the subject, it did no more than determine the effect of the manure upon the present crop, taking no account of the value of the unexhausted manure, which was probably considerable, for it appears to be consistent with theory, that manure prepared under cover will undergo decomposition more slowly than that made on the old plan. He had been particularly interested by some of the statements of Mr. Main's experiments, which appeared to him of great importance. He might particularise Mr. Main's experiment, with recent and with well-rotted manure, in which he found that from 28 tons of each, he obtained a somewhat larger crop from the fresh manure. The experiment was a particularly important one, and even more than might at first sight appear. The fact, then, was a matter which might not strike the audience, but which was really of great importance. Mr. Main compared 28 tons of fresh with 28 tons of rotted manure ; but it ought to be borne in mind that 28 tons of fresh manure, if rotted for four months, as in Mr. Main's experiment, would be reduced in quantity to less than 20 tons. So that the 28 tons of rotted manure corresponded to somewhere about a quarter more ; or about 35 tons of the fresh, so that there would appear in this process of decomposition to have been a loss of about a quarter of the manure. At this late period of the day, he was unwilling to occupy the time of the Society by entering upon many other subjects of interest. There was only one other matter to which he would refer, which was the nature of the absorbents to be employed for absorbing the liquid manure. His attention had been particularly directed to this subject of late, by its having been remitted to him by the Committee of the Highland Society, to enquire into the economic uses of peat, which have of late excited so much attention. Much of that enquiry, which included the distillation of peat, &c., was irrelevant to the subject of the present debate. But he had also enquired into the comparative absorbent powers of peat charcoal, and of peat itself for ammonia. His experiments had been made by adding to dry peat and peat charcoal, successive small quantities of a diluted solution of ammonia of known strength, and ascertaining how much could be added without communicating the smell of ammonia or its alkaline properties. He had thus found that peat absorbs a much larger amount of ammonia than peat charcoal, but that the amount of ammonia absorbed is dependent upon the dryness of the peat. When absolutely dry he found it to absorb about 5 per cent. of ammonia, but when not so dry, about 3 per cent. ; while his peat charcoal was incapable even of absorbing 1 per cent. of ammonia. These, however, were merely the preliminary experiments, which he intended to repeat and vary, so as to ascertain all the circumstances of the absorption. Other substances might also be employed, such as dry earth, and the like, but he believed their value to be inferior to that of peat.—Lord Kinnaird agreed with Dr. Anderson that the experiments made by Mr. Campbell of Craigie, and which went to show that covering did not improve the manure, were not quite satisfactory. As to Turnip shaws, whether these should be ploughed in immediately after being pulled, or be allowed to decompose, a difference of opinion exists. He had made the experiment with one-half ploughed in and the other half allowed to rot, and then afterwards ploughed, and found no difference whatever. It might be explained by the different effects produced in winter compared with summer, as in the latter case the loss would be greater. Remarks were also made about passing the whole straw of the farm through the cattle, and the consequent saving of Turnips by using the straw along with them. I was giving 130 to 200 lbs. of Turnips per day to my cattle. After reading Mr. Milne's paper, I wrote to Mr. Huxtable to learn if the statement was fully correct that he only gave 50 lbs. weight, and received the following answer: — "The amount stated by Mr. David Milne in his pamphlet is strictly correct, though the quantity consumed by each animal can scarcely be considered 'a constant quantity,' exceeds 10 lbs. per head in the daily average of 50 lbs. The method employed is this :—The Turnips are rasped into very thin slices by a machine called 'Moody's Crusher.' The Turnips so finely divided, are well mixed with rather more than an equal bulk of straw. The cattle are thus compelled, along with the roots, to get a considerable bulk of straw. The chief use of the straw is, that 'it takes off the chill,' where the employment of a large amount of watery Turnips (90 per cent. of cold water, I believe) is apt to give, exhibited in a loose state of the animal's bowels. I am not sure of the value of this explanation, but I am of the practice itself. It was taught me by a practical farmer some years ago, to whom, when I pointed out some oxen who made no progress, though eating nearly 200 lbs. of Swedes daily, I owe the instruction that they would do better with one-quarter the amount of roots, if I would employ Moody's Crusher, and mix straw chaff as before described. The additional nutriment necessary to fatten animals I apply in the shape of 3 lbs., 5 lbs., and, for six weeks at the end of the process, 7 lbs. of meal daily. We feed our beasts four or five times a day ; give the meal at two or three other intervals, always throwing it amidst the roots and straw which may be left over the last meal, enticing them to eat up every bit of straw or left Turnip clean ; they, in fact, lick their own mangers perfectly clean, in the process of eating up the dusty meal. I have no experiments (of my own) to determine the relative value of Swedes and Mangold Wurzel. Such a determination would be very difficult, for I find that the Mangold Wurzel grown upon my chalk land is very superior for early use to that grown upon clay soil. At this season of the year, I greatly prefer Swedes to Mangold Wurzel. I do not always steam the straw with the roots, nor consider it essential ; but I think that the cost of the process is more than paid for by the increased solubility of the woody fibre of the straw thus treated. When I feed my cattle upon straw and meal only, I consider it absolutely necessary to steam the straw ; and I have found the beasts do very well upon this diet, for a month at a time ; but I have only had recourse to this system in certain moments of scarcity, which have twice or thrice occurred to me, in selling cattle in the late spring."

## Miscellaneous.

*Height of Carriage.*—A good labourer, digging a soil of ordinary consistency, will turn over more than 200 square yards, probably 2000 square feet, in a day, from 10 to 12 inches deep; he will thus turn over from 80 to 100 tons of earth per diem: the same man, if he had to fill a wheel-barrow, could not lift more than from 16 to 20 cubic yards, while if he had to throw this earth over the side of a cart or a waggon, he could not manage more than one-fifth part of the weight he lifted in the first case; and of course the higher the edge over which the material has to be thrown—the higher the edge of the cart or the waggon that he is filling—the more will be the labour connected with the shifting of a given weight of material. To lower the edge and bed of the vehicle one foot, would lessen the labour of filling it by a fifth or sixth part, a most important difference; and when, as in Stratton's Northampton cart, compared with the waggon, the difference between the levels on which the load is to be carried amounts to nearly 2 feet, the relative merits of the two, on the score of economy, appear plainly enough. *J. C. M., in Morton's Cyclopedia of Agriculture.*

METEOROLOGICAL REPORT.—Jan.

* This storm came from the southward, and probably lay very heavily along the coast of Portugal, and went away to northward.

† I anticipate that this storm will have been felt very severely by the North American and Liverpool steamers off the banks of Newfoundland, as it must have come from the west and north, from the unusual cold which *preceded* it. Probably it passed up the Irish chanel, and across the south of Scotland.

Dorchester, Jan. 24th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

An Essex Farm.—The horses have been doing little since my last, the weather being very wet. We have now ploughed all the land intended for Beans, and most of that intended for summer fallowing and Turnips. The ewes are now fast dropping their lambs, and hitherto we have not lost either ewe or lamb. Those that have lambed are turned out on fine days on a dry pasture that has been partly Gurneyised—with this difference, that it has long dung instead of straw, and this is an improvement. There is a nice bite, quite as much as one has generally at the beginning or middle of April ; they receive as many cut Turnips as they will eat, with chaff cut, half red Clover, and half Wheat straw. Those which have not lambed run during the day on the pastures, and have some whole Turnips strewed about to amuse themselves with ; and they have some chaff in their fold at night, and this seems to keep their bowels from getting too much relaxed. The breed is half-bred Norfolk and Hampshire Downs, and is much liked by the London butchers, being not over-large and coarse. They are better suited for heavy land than a larger breed. The day-men are now land ditching and draining, and have been so for the last two months, and will be so employed for the next fortnight or three weeks, weather permitting. It is part of the agreement in this part to drain a certain quantity every year, as this was no doubt intended to employ the labourers during the winter ; but I must say that it would be difficult to find work for them without it, for, from the latter end of November till February, many of the farmers are adopting a system of only employing men when the weather is fine, and suitable for different field operations ; and as the machine is employed to thresh almost all the corn, there is, of course, nothing for them to do, except those engaged about the horses and cattle. It is heart-rending to see such a number of strong hearty men walking about doing nothing. Poor fellows, they live hard and work hard enough when fully employed, and their privations must be dreadful when only employed a day or two now and then. Draining is done by the piece, and they earn a little more than at day work, as day-men receive only 1s. per day. It is done by the score rods (5½ yards), and the price this winter is about 3s. per score; mixed soils a little more, and some less, as from the great number anxious to get a job, a man may get it done at his own price. In fact, this county is overrun with labourers, with nothing but the land to employ them ; a good hand may be able to earn 1s. 4d. per day, but he must be a good one; and if he was able to earn more, a reduction would be made in the price. This is in effect a perfect preventive of any exertion on the part of the men ; and so long as the present system continues, of farmers not informing men what they are to receive for their work until it is finished, it cannot be expected that they will endeavour to do as much work as they otherwise would. The greater part of the land now draining appears to have been drained three times at least, from the present cutting going across them ; the oldest drain is not more than 12 inches from the surface, the next about 15 inches, and the last a little more than 18 inches. This shows how much they fill up during a certain number of years. According to the custom in this part of Essex, each field would be drained about every 15 years ; and in looking over the books kept for the last 50 years, this appears to have been the case on this farm ; the drains were, I believe, always rammed till within the last 10 years, and they seem to have stood pretty well, as most of them appear to be almost as perfect, except the bottom, as the day they were cut, but they are most silted up at the upper end. It seems that the quantity of water running down has not had sufficient power to carry the soil dropping from the top and sides ; the drains now are cut 2 feet deep, about six inches being ploughed out, and two spits of 9 inches each ; they are filled in with bushes, and some with straw ropes twisted very tight. Pipes are little used here, from their great expense, and they are not thought so much of here ; and from the frequent complaints made respecting their stopping up, it does not appear that they are always successful. *E. X., near Braintree, Essex.*

## Notices to Correspondents.

Books: *E.* Blackie's "Cyclopedia of Agriculture."

Carrot-tops: *G S.* We find them palatable to all sorts of stock without any difficulty. If they are rotten you *cannot* make them palatable.

Deformed Turkeys: *C. R.* You will find the subject noticed in the Poultry Miscellany in our No. for Sept. 18, last. It is apt to be brought on by neglect of the bird while in a growing state, by bad seasons, and by late hatching. *Perhaps* it may be desirable that you should change your stock birds, but of that you will be the best judge.

Drainage: *Seven Years' Subscriber.* So that you begin in time enough to finish all you have to do before your seed time—the later the period, *i.e.* the drier the ground, the better.

Education for an Australian Sheep Farm: *X Y.* Send the young man to Cirencester for attendance on lectures, &c., one year, and to a stock farmer in South Scotland for another year.

Farm Capital: *E T.* We must beg for another week. We do not understand your request about an introduction to an instructor. Do you wish to reside on a farm or a year?

Feeding Sows with Swede Turnips: *An Amateur Farmer* says:—"The manager of my small farm has been feeding four sows that are suckling pigs for some time with uncooked Swede Turnips, in addition to wash and a little Barley-meal. The Turnips are sliced with one of Gardner's admirable cutters, and given them between the regular times for feeding. I find the pigs grow fast, and look very full of health and thrifty."

Flax: *A G.* Mr. Schenks' patent has been, and is carried out successfully in Ireland. We do not know his charge for working it. You had better apply to the Secretary of the Irish Flax Society, Belfast. T. K. Short's pamphlet gives details of cultivation. So does Blackie's Cyclopedia of Agriculture.—*A B, Effingham.* T. K. Short's pamphlet. Half a bushel of Canary seed is sown per acre.

Flax and Chicory: *G S.* A sandy clay or "loam" is the right soil for both. Information on both shall be given in articles here before seed-time.

Gorse and Hemp. The Editor would be glad to meet with any one personally acquainted with the cultivation of these crops.

Grass Land: *V R.* Five small horses, 8 Alderney cows, and 10 calves, can easily be kept on 45 acres of Grass land of ordinary quality—yielding say 26 or 28 cwt. of hay per acre. You will need 27 or 28 tons of hay for winter food, so that half the land should be kept for hay every year. A plot of the land for Cabbages and Mangold Wurzel would be a great assistance.

Italian Rye-grass: *Amateur.* Italian Rye-grass, if cultivated properly, will yield far more weight per acre than Tares. You may cut it many times in the season—Tares only once. But then it ought to have been sown last summer to be useful this one.

New Zealand Flax: *W W.* Phormium tenax withstands the rigour of our winters; but the results of experiment in Ireland tend to show its produce here is much inferior to that imported. *Lawson.*

Pigs: *H T.* Raw Swedes and Mangold Wurzel will keep them in store condition perfectly.

Poultry: *C S.* Your questions, all but one, have been abundantly answered in former numbers of the *Agricultural Gazette*, which you can easily refer to by means of the indexes to each volume. The only new inquiry is "whether you know of any mode of *marking* fowls, so as to be able to identify them if stolen." You would get the best advice as to this from a rural policeman. But, we may remark, it is a more Christian office to *prevent* the commission of crime than to detect it when committed. The web of feathers may be snipped in unseen places; the foot-webs of water-fowl may be marked; the feathers will be moulted, and the marks will grow out. Moreover, skilful fowl-stealers mostly pluck and partially dress their prey *upon the spot*, leaving plenty of "wrecks behind." *D.*

# Markets.

## COVENT GARDEN, Feb. 1.

Hothouse Grapes and Pine-apples are still somewhat dear, and the supply of good dessert Pears is limited. Apples are sufficient for the demand. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Forced Vegetables of all kinds are abundant and good. Seakale, Asparagus, and Rhubarb are excellent. French Beans are very scarce. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. The best Musbrooms fetch 1s. 3d. per pottle. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Cinerarias, Chrysanthemums, Roses, and the different kinds of spring bulbs.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6s to 8s | Pomegranates, each, 3d to 6d |

| Old Clover ... ... | 78 84 | | |

POTATOES.—Southwark, Jan. 27.

The Committee report that the arrivals last week were limited, but trade has been so heavy that the quotations are without alteration, except for Scotch Regents, which were a little dearer. Cups are bad to sell at any price. The following are this day's quotations:—York Regents, per ton, 80s. to 100s.; Scotch do., 65s. to 80s.; ditto Cups, 60s. to 65s.; Cambridgeshire and Lincolnshire Regents, 70s. to 80s.; French whites, 50s. to 65s.

COAL MARKET.—Friday, Jan. 31.

Hollywell, 14s. 6d.; Eden Main, 14s.; Davison's West Hartley, 14s.; Wallsend Haswell, 15s. 9d.; Wallsend Lambton, 15s.; Wallsend Tees, 15s. 6d.—Ships at market, 105.

SMITHFIELD, Monday, Jan. 27.

The number of Beasts is not very large; the weather being favourable trade is more cheerful, and our top quotations more cheerfully given. We have about an average supply of Sheep; trade is about the same as on Monday last. Good Calves are scarce and dear; although we are enabled to quote 5s. for a choice one, it must be considered an extreme price. Pigs are still selling very badly. From Holland and Germany there are 405 Beasts, 1210 Sheep, and 100 Calves; from Norfolk and Suffolk, 2100 Beasts; from Scotland, 400; and 900 from the northern and midland counties.

| Per st. of 8 lbs.—s d | s d | Per st. of 8 lbs.—s d | s d |
|---|---|---|---|
| Best Scots, Hereford, &c. ... 3 | 6 to 3 8 | Best Long-wools . 3 | 6 to 3 10 |
| Best Short-horns 3 | 4 — 3 6 | Ditto Shorn ... ... | |
| 2d quality Beasts 2 | 4 — 3 0 | Ewes & 2d quality 2 | 10 — 3 2 |
| Best Downs and Half-breds ... 4 | 0 — 4 4 | Ditto Shorn ... ... | |
| | | Lambs ... ... ... | |
| Ditto Shorn ... ... | | Calves ... ... 3 | 6 — 5 0 |
| | | Pigs ... ... 2 | 10 — 3 6 |

Beasts, 3763; Sheep and Lambs, 20,640; Calves, 145; Pigs, 280.

Friday, Jan. 31.

The supply of Beasts is small—fully adequate, however, to the demand. Trade is exces-ively dull, and Monday's prices are barely supported. The number of Sheep is very small, as is usual at this time of year. There are but few buyers, and prices are no better. Calves are more plentiful, the average quality is middling. Prices are considerably lower than on Monday, and several remain unsold. From Germany and Holland we have 48 Beasts, 180 Sheep, and 140 Calves; from Norfolk and Suffolk, 200 Beasts; 100 from the northern and midland, and 80 milch cows from the home counties.

MARK LANE.

Monday, Jan. 27.—The supply of Wheat from Essex and Kent this morning was unusually small; the former realised the terms of this day se'nnight, the latter remained unsold at a late hour. Business in foreign was of the most limited character, and excepting for particularly fine qualities late prices were with difficulty maintained.—English malting Barley is unaltered in value. Owing to a large arrival of Danish, distillers hold off from purchasing, in the hopes of coming in at cheaper rates.—Beans must be written the turn cheaper.—The value of Peas is unaltered.—The Oat trade is very heavy, and we reduce our quotations 6d. per qr.

Friday, Jan. 31.—The arrivals of foreign Wheat since Monday amount to 29,210 qrs. and the attendance of buyers both on Wednesday and to-day being very limited, sales have been restricted, and where forced some concession in price has been necessary. Having scarcely any demand for spring corn prices must be considered entirely nominal.—Flour continues a dragging sale at our quotations.—Polish Odessa Wheat afloat is held at 34s. to 35s., and Galatz Maize at 30s. to 31s. per qr. Our advices, both foreign and English, represent the trade of the past week as continuing very depressed and dull.

Liverpool Friday, Jan. 24.—The arrivals of grain and Flour since Tuesday have not been of importance, and, with a slack demand, prices generally have undergone no change. There was no activity in the corn market to-day. Wheat and Flour were held with much firmness, and late prices were quite supported. Oats and Oatmeal were without change in value. Egyptian Beans were 6d. per qr. cheaper. Barley and Peas were neglected. Indian Corn was more in request than for several market days, and an advance of fully 6d. per qr. was established.—Tuesday, Jan. 28.—The supplies of British grain and Flour are still insignificant. The foreign arrivals this week are fair. At this morning's market there was a fair attendance of town and neighbouring millers. Good fresh samples of English and foreign Wheat were in request, at full prices, but every other description moved slowly. Sack and barrel Flour were taken moderately, at similar rates as on Tuesday last. Several parcels of Indian Corn were bought for Ireland, and the stands were well cleared of this article, at an advance of fully 1s. per qr. on the price of this day se'nnight; 31s. per 480 lbs. was paid for good mixed American, and prime yellow is now held for 31s. 6d. to 32s. Oats, Barley, Beans, and Peas were in limited demand, and prices remain unaltered.

HARTLEY'S PATENT ROUGH PLATE GLASS FOR CONSERVATORIES, &c.

See Article in the Gardeners' Chronicle of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. Hartleys, and sold by messrs. James Phillips & co., 116, Bishopsgate street."

Supplied Wholesale, Retail, and for Exportation; cut to order in panes of

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sashes is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to James Hetley and Co., 56, Soho-square, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes.

6 by 4 ins., 6 by 4½ ins., 6½ by 4 ins., 6 by 5½ ins., 6½ by 5 ins., 12s. each.

6½ by 5½ ins., 6 by 6 ins., 6½ by 6 ins., and under 8 by 6 ins., 13s. each.

9 by 7 ins., 9½ by 7½ ins., and 10 by 8 ins., 15s. each.

Large sizes, 16 oz., 2d. and 2½d. per foot.

Large sheets, to 240 and 300 feet cases 2½d. to 2¾d. per foot.

16s. per box; or ½d. per foot if less than one box be taken:

| | | | |
|---|---|---|---|
| 11 inches by 8 inches | | 13 inches by 9 inches | |
| 12 ,, by 8 ,, | | 12 ,, by 10 ,, | |
| 12 ,, by 9 ,, | | 14 ,, by 10 ,, | |

Boxes charged 1s. each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other house can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

GLASS SHADES FOR ORNAMENTS.—Our prices 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the purity of Milk: four tubes in frame, 6s. each. Wasp Traps, 4s. per dozen. Shades for Pianofortes, 9d. each.

MILK PANS 2s. to 6s. each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2d. each; Cucumber Tubes, 1d. per inch; Peach Glasses, 1d. each; Pastry Slabs; Glass Plates, in wooden frames, for pine and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

N.B. The moderate charge of 1s. for each packing case will be made which we think will be an inducement for parties to retain them; but if not back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

SMITHFIELD CATTLE SHOW.—MILK PANS, in stout Glass, of every size and variety of shape, were exhibited as usual, Nos. 148, 149, 150, Bazaar, by Messrs. COGAN and Co., whose collections were honoured (amongst other Prizes) with the Silver Medal of the Dublin Society in April, as also with the Silver Medal of the Liverpool and Manchester Society, at their meeting, held at Warrington in September last.

NOBLEMEN, FARMERS, and the Public generally, are respectfully invited to notice the NEW GLASS CHURN, LORD CAMOY'S MILK SYPHONS for separating Milk from Cream, GLASS LACTOMETERS for ascertaining the quality of Milk, New Bee Glasses invented by Lord Keane, Glass Cream Pots and Pans, Glass Milk Trays, Glass Tiles and Slates, and every description of Dairy Glass.

Durable Farm Paints, Glass for Greenhouses and Garden purposes, may be had (safely packed) for any part of the Kingdom, or for exportation, on application at the Warehouse, 48, Leicester Square, London.

Small Glass for Melon Pits of every size, from 10s. 6d. per 100 feet; Hartley's and Swinburne's PATENT ROUGH PLATE at the Manufacturer's prices,

Glass Ornamental Shades, Fern Shades, Lamp and Gas Glasses, Patent Glass Pens; Patent Texturalised, Sulcated Marble, and other Ornamental Glass, supplied, as usual, at 48, Leicester-square; the Colour and Lead Department, at 5, Prince's-street, Coventry-street, London.

COCHIN CHINA FOWLS.

Some Pure Bred COCHIN CHINA COCKS for sale; weigh from 7½lbs. to 8lbs. each, age 8 months, price 30s. each.—Direct A. C. S., Post-office, Andover.

---

FIRE IN THE HOUSES OF PARLIAMENT, JAN. 27.
FIRE AT MESSRS. BOUSFIELD'S, HOUNDSDITCH, JAN. 27.
FIRE AT THE NEW CROSS RAILWAY STATION, JAN. 28.

THE FIRE in the CLOCK-TOWER of the HOUSES PARLIAMENT was caused by ignition of a quantity of timber stored in it, and it was nearly an hour before the fire could be subdued, with the help of seven or eight Engines in the immediate vicinity of the Thames—a similar fire in a two-story house erected for the purpose at Vauxhall, and filled with timber and shavings saturated with tar and turpentine has been extinguished by PHILLIPS' PATENT FIRE ANNIHILATORS in a few minutes see *Times* and other Morning Papers of the 18th January last); this experiment will satisfy the most sceptical that the fire in the Houses of Parliament, as well as the fires in Houndsditch and at the New Cross Station could have been checked and extinguished at their commencement, by the use of the FIRE ANNIHILATORS. Further to satisfy public inquiry as to the efficacy of the e Machines, a demonstration will take place on Thursday next, the 6th February, at 4 o'clock, P.M., precisely. Orders for admission may be obtained on application to the Secretary at the Company's Offices, 105, Leadenhall-street.

FIRE ANNIHILATORS.

PHILLIPS' PATENT MACHINES for EXTINGUISHING FIRE may be had at the Offices of the Company, 105, Leadenhall-street, City, nearly opposite the India-house, complete with all necessary apparatus, at the following prices, viz.—2l. 2s., 3l., 4l., 5l., and 6l.—N.B. The Machines are of such simple construction that a child can use them, and the vapour emitted from them enables a person to breathe with safety in a room previously filled with flames and smoke, while without it he would be liable to be suffocated

---

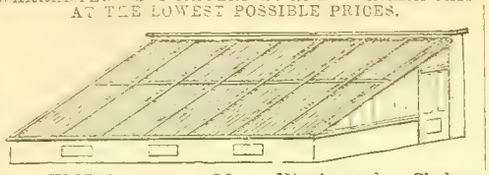
BAROMETERS FOR THE MILLION.

BROWN'S REGISTERED BAROMETER is sold by HENRY BAKER, INSTRUMENT MAKER TO THE BOARD OF ADMIRALTY, 90, Hatton-garden, London, price 10s. 6d. This unique little instrument has given great satisfaction, the price placing it within the reach of persons who would not be able to purchase a more expensive article. Persons purchasing a dozen supplied at the wholesale price, for cash only. Night Thermometers for registering the extreme of cold, 5s.

---

THE REGISTERED ROSE GIRDLE-LABEL.—A Rose Grower (having found, by long experience, the present method of securing Standard Plants by wires of any kind, and cord or rope of whatever description, to be highly injurious to the bark, and otherwise detrimental to the growth of the plant, besides being clumsy, troublesome, and ineffectual), has the pleasure of submitting to Amateurs and the Public a new Invention which he has recently introduced, for the more efficient and neat fastening of Roses and other Standard Plants to their Stakes.

The REGISTERED ROSE GIRDLE now offered to the Public, besides the advantage of being well adapted for a neat and permanent Label to the plant which it secures, will greatly diminish the time and trouble attending the mode hitherto pursued in the tying of Standard Plants to their stakes. The utility of this invention, while combining two important objects (till now very imperfectly attained), cannot but entitle it, from those who wish a neat and permanent Label as well as an efficient fastener for their Standard Plants, to an additional claim. It is neat as it is efficacious, and as cheap as it is useful.



EXTRACT FROM "FLORIST'S DIRECTORY."—"We consider it one of the most useful articles that have been invented—it forms a permanent Label as well as an unerring fastening, and we shall be disappointed if it is not generally used for Roses and Standard Cytisuses. We shall adopt it for everything we can apply it to in the garden."

Sold, wholesale and retail, by WILLIAM HAMILTON, Seedsman and Florist, 156, Cheapside, London; and to be had of all Nursery and Seedsmen. Price 1s. 6d. per dozen.

---

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

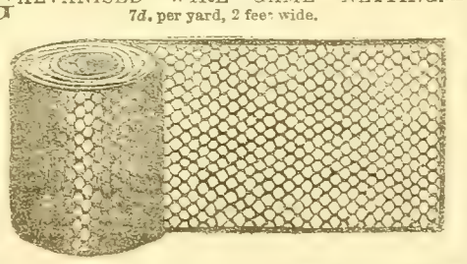
J. WEEKS AND CO., King's-road, Chelsea Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

---



STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wirework, &c

| 1¾-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1¾-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

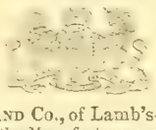
All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

---

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry: and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.



| | | | |
|---|---|---|---|
| 12 inches wide | 3d. per yard. | 30 inches wide | 7½d. per yard. |
| 18 ,, ,, | 4½d. ,, | 36 ,, ,, | 9d. ,, |
| 24 ,, ,, | 6d. ,, | 48 ,, ,, | 1s. ,, |

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; it galvanised, 2s. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each, Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wirework; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

---

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

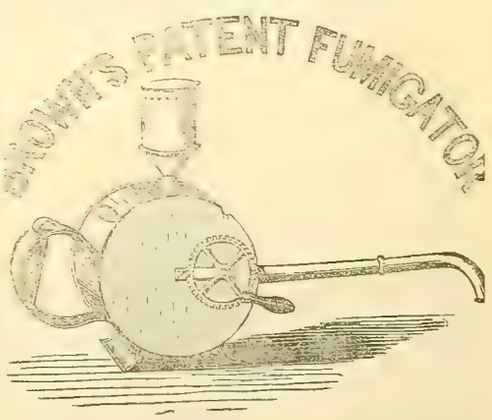
PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.



The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

---

PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

---

DR. S. NEWINGTON'S PATENT DIBBLES, HAND-HOE CULTIVATORS, DRILLS, and other Agricultural Implements for effecting a more scientific system of cultivation, and insuring more abundant crops. Early orders must be given to ensure early execution. An illustrated Catalogue, &c., may be obtained on application to Messrs. DUFAUR and Co., sole manufacturers, 21, Red-lion-square, London.

---

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

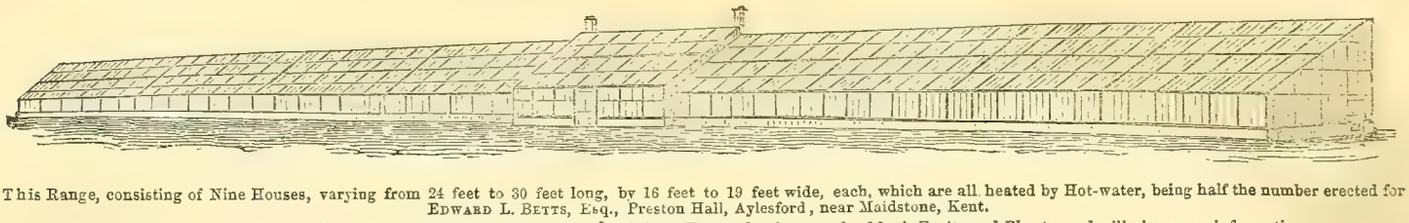
Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the works in the Grove, Southwark, London.

---

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the teeth. Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designating unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. ROWLANDS ODONTO, or PEARL DENTRIFICE, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*



ROWLANDS' ODONTO is a white Powder compounded of the choicest and most *recherché* ingredients of the oriental herbal.—Price 2s. 9d. per box.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

**BY HER MAJESTY'S ROYAL LETTERS PATENT.**

# PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.

## E. DENCH, PATENTEE.

This Range, consisting of Nine Houses, varying from 24 feet to 30 feet long, by 16 feet to 19 feet wide, each, which are all heated by Hot-water, being half the number erected for Edward L. Betts, Esq., Preston Hall, Aylesford, near Maidstone, Kent.

Mr. Thomas Frost, the Head Gardener, has proved the superiority of these Houses for the growth of both Fruits and Plants, and will give every information.

THE PATENT consists of two distinct principles for all Horticultural Erections—on one plan the Roof is formed wholly of Iron and Glass, no wood or putty, &c., and not more than three-quarters of an inch of light being taken up anywhere, and is very light, strong, and elegant, free from drip, and perfectly impossible for the rain to penetrate; the other principle consists of the Roof being formed in Sashes, and the surface of the Roof being Iron, Glass, and Putty, and, the work being hollow, is perfectly free from contraction or expansion. These Houses have been proved in all parts, and are found to excel all others. Heating by Hot-water on most scientific principles.

ONE GOOD SECOND-HAND HOUSE FOR SALE.

LILIUM LANCIFOLIUM, RANUNCULUSES, ANEMONES, AURICULAS, AND PELARGONIUMS.

HENRY GROOM, Clapham Rise, near London, by appointment Florist to her Majesty the Queen, and to his Majesty the King of Saxony, begs to recommend to the attention of the Nobility, Gentry, and Amateurs, his extensive assortment of the above FLOWERS. He begs to say that this is a good season of the year to make a selection of the various kinds. Ranunculuses and Anemones should be planted this month.

Archibald Godwin, Rose Grower, Ashbourne, Derbyshire.

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the Stanwick Nectarine. Upon examining the young plants in Mr. Rivers's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these five guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. William Brailsford, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. William Brailsford, who, upon their receipt, will return an order upon Mr. Rivers for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope, that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use, yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

SUTTON'S LETTUCES AND CUCUMBERS.

JOHN SUTTON AND SONS, Seed-Growers, Reading, Berks, have much pleasure in referring their friends to the description of their superior sorts of Lettuces, given by the Editor of the *Gardeners' Chronicle*, in March last, which will be seen in Messrs. Sutton's advertisement on the last page of the *Gardeners' Chronicle*, of January 25. Also, the following extract from a letter just received:—

"Messrs. Sutton and Sons:—Gentlemen,—I have grown all the sorts of Cucumbers which I have seen advertised, but the 'Conqueror of the West' is far before any other in my estimation. I have now grown it several years, and intend to grow none other this season. Your Lettuce, too, is excellent, and certainly I have never seen any sort so large. I have observed that it is not so apt to run to seed as others, which renders it very valuable in hot dry summers, and for autumn use."—*From Mr. Smithers, Head Gardener to the Earl of Carnarvon, High Clere, near Newbury.*

*N.B. These Lettuce Seeds will be sent free by post on receipt of postage stamps in payment, in good-sized packets, at 1s. each; but the stock having become very short, they cannot now be sold by the ounce.*

The CONQUEROR OF THE WEST CUCUMBER is 2s. 6d. per Packet, or three seeds for 1s.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, &c., may be obtained gratis on application. It describes the colour of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections. He has many thousands of Rhododendron ponticum in sizes very suitable for planting immediately into Game Preserves, very healthy bushy stuff, price 5l., 7l. 10s., and 10l. per 1000.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway, and three miles from Blackwater, South-Eastern Railway.

SILVER SAND, PEAT, &c.—REDUCTION OF PRICE.

EDWARD KEMP begs to return his grateful acknowledgments to his Friends and Patrons for favours hitherto received, and informs them that he has made considerable reduction in the price of Silver Sand, which he trusts will ensure a continuance of their support. Particulars will be forwarded on application addressed Edward Kemp, 16, Ann's-place, East-street, Old Kent-road, London.

N.B. No connection with any other party.

SEED.—Any persons having good Seed of fine kinds of PRIMULA SINENSIS, may meet with a purchaser by addressing a line, stating quantity, colour, and price, to Y. Z., post-office, Brompton, near London.

BRENTFORD, MIDDLESEX.—FINAL SALE.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET GARDENERS, AND OTHERS ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the late Mr. J. Ronalds, to offer to public competition, by Auction, on the premises, the Butts and Twolands Nurseries, about the first week in March, the whole of the remaining NURSERY STOCK, consisting of a rich assortment of Fruit and Forest Trees, Evergreens, Ornamental and Deciduous Shrubs, American Plants, &c.—May be viewed, and Catalogues had, prior to the sale, of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

FARM TO LET—COUNTY MEATH.

TO BE LET, from the 25th day of March next, the TOWNLAND OF PONDERLOUGH, containing about 198 acres Irish plantation measure, on which stands the Carman's Stage at "The Bush," on the great northern road, within 10 miles of Dublin.

This farm being within two miles of the Dunshaughlin Workhouse, is well situated for the supply of milk to that establishment. The land is also suitable to the growth of Flax and Wheat, and is capable of great improvement in the hands of an industrious, intelligent farmer.

The farm will be let to a tenant willing to employ a proportionate capital in its cultivation, on a lease for such time as may be agreed on, with such conditions as will secure a septennial revision of rent on the market averages, and a full compensation for the increased value at the termination of his occupation. The landlord will also assist in draining such portions of the farm as may be necessary by loan from the Commissioners of the Board of Works.

Application to be made to John Maher, Esq., Ballinshula, Enniscorthy; Francis Murphy, Esq., Kilcairn House, Navan; or Wm. O'Hara, Esq., 13, Upper Merrion-street, Dublin.—Jan. 25th, 1851.

THE HIPPOPOTAMUS, presented to the ZOOLOGICAL SOCIETY by H.H. the Viceroy of Egypt, is Exhibited daily at their Gardens, in the Regent's Park, from 11 to 4 o'clock. Visitors desirous of seeing the Animal in the water are recommended to go early.

Admission, One Shilling; on Mondays, Sixpence.

"WHERE SHALL WE GO THIS MORNING?" Such is usually the query over the breakfast-table with visitors to London. Let us answer the question. If you can admire the most beautiful specimens of Papier Mache manufacture which are produced in this country, displayed in the most attractive forms—if you want a handsome or useful Dressing-case, Work-box, or Writing-desk—if you need any requisite for the work-table or toilet—or if you desire to see one of the most elegant emporiums in London, then you will go to MECHI'S, 4, Leadenhall-street, near the India House, in whose show-rooms you may lounge away an hour very pleasantly.

This day is published, Part III., price 7d., of the COTTAGE GARDENER'S DICTIONARY. Edited by G. W. Johnson, Esq., Conductor of the "Cottage Gardener," &c. Assisted by Messrs. Beaton, Errington, Fish, Appleby, Barnes, and Weaver. The work will form, when completed, a handsome volume of 800 pages, illustrated with Woodcuts.

London: W. S. Orr and Co., Amen-corner, Paternoster-row.

Price One Shilling,

Dedicated to the Highland and Agricultural Society of Scotland.

ON A REMARKABLE EFFECT OF CROSS-BREEDING. By Alexander Harvey, M.D., Physician to the Aberdeen Royal Infirmary, and Lecturer on the Practice of Medicine in the University and King's College of Aberdeen.

Wm. Blackwood and Sons, Edinburgh and London.

SOWERBY'S ENGLISH BOTANY. Now ready, Vol. IV., price 1l. 16s. cloth boards.

Vols. I., II., and III., price 1l. 19s. 6d. each, cloth boards, and cases for binding the Vols., always on hand.

*** Subscribers who may desire to complete their copies can do so from the stock of the 2d Edition at Re-issue price.

To be had of Mrs. Sowerby, 3, Mead-place, Lambeth; and of all Booksellers.

YOUATT'S WORKS ON THE HORSE AND DOG. (By assignment of C. Knight.) Longman and Co.

THE HORSE. The only edition with the Author's latest Corrections, and Illustrations on Wood. 8vo, 10s., cloth.

"The author has subjected it to so complete a revision, as to make it in many respects a new work."—*Preface.*

*** Purchasers should order the edition published by Longman and Co.

THE DOG. With Woodcuts. 8vo, 6s., cloth.

London: Longman, Brown, Green, and Longmans.

METCALFE AND Co's NEW PATENT TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at Metcalfe, Bingley, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

Caution.—Beware of the words "From Metcalfe's," adopted by some houses.

Printed by William Bradbury, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, February 1, 1851.

HEATHS AND OTHER PLANTS FOR EXHIBITION.

WILLIAM JAMES EPPS begs to state that he has for sale the finest Stock of Young HEATHS and other Greenhouse and Stove Plants possible, which will make splendid specimens in a short time. The superior character of Plants sent out from this Establishment is justly admitted by all who have purchased. The magnificent specimens of Heaths, &c., exhibited by him last season at the Exhibitions at Chiswick and the Royal Botanic Gardens, London, where he received the highest awards, fully justify the foregoing remarks.
Strong bushy Plants can be had at the following low prices, exclusive of packing, carriage paid to London:

| | £ | *s.* | *d.* |
|---|---|---|---|
| 100 fine varieties of Heaths ... ... | 5 | 0 | 0 |

All the new leading kinds of Geraniums and Cinerarias 12*s.* to 21*s.* per doz.
Catalogues of the above may be had on application.
Bower Nurseries, Maidstone.—Feb. 8.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.
Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Feb. 8.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENÉ LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.
The Stock is such as has never before been offered to the Public by any grower.
R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents.

CUCUMBER—"PHENOMENA."

EDWARD TILEY begs to offer to Cucumber-growers generally the above superb CUCUMBER, which he feels confident will give the greatest satisfaction to them, as did the former kinds sent out by him during the last seven years, being Victory of Bath, Gordon's White Spine, and Lord Keynon's Favourite.
The above splendid Cucumber, "Phenomena," was a hybrid between Hamilton's Black Spine and Mills's Jewess, which it surpasses, both for its prolific qualities and length of fruit, generally growing from 22 to 28 inches. It is a beautiful black spine, of a dark green colour, and free from ribs or shrivels; it also grows quickly, carries its bloom well, and will be found first-rate for exhibition. As a proof of its prolific qualities and length, the following may be vouched for, viz.:—There were cut from two plants, grown in a one-light box, the size of which was 4 feet by 6, 24 brace of Cucumbers, each fruit averaging 22 inches long—total length of the whole amounting to 29 yards 1 foot. It is solid, and eats very crisp. Sold in packets containing seven seeds, 5*s.*; or three seeds, 2*s.* 6*d.*
E. T. has also seed of his three other superb Cucumbers at the following prices:

| | | | |
|---|---|---|---|
| Victory of Bath, per packet ... ... ... | 2*s.* | 0*d.* | |
| Gordon's White Spine, ditto ... ... ... | 1 | 6 | |
| Lord Keynon's Favourite, ditto ... ... | 2 | 6 | |

This last is the best for winter cultivation.

MELONS.

BROMHAM HALL GREEN-FLESH MELON.—This has again this season surpassed all others for its superior flavour; it was placed first and second for flavour at the Chiswick Exhibition last season, and obtained a great number of first prizes throughout the country where exhibited. Sold in packets at 1*s.* 6*d.* each.
E. T. has also seeds of the following superb Melons, which he can with confidence recommend:

| | | | |
|---|---|---|---|
| Camerton Court Green-flesh ... ... | 1*s.* | 0*d.* | per packet |
| Queen Melon ... ... ... ... | 1 | 0 | ,, |
| Blackall's Green-flesh ... ... ... | 1 | 0 | ,, |
| Bailey's Green-flesh... ... ... ... | 1 | 0 | ,, |
| Bowood Green-flesh... ... ... ... | 1 | 0 | ,, |
| Beechwood Green-flesh ... ... ... | 1 | 0 | ,, |
| Windsor Prize ditto... ... ... ... | 1 | 0 | ,, |
| Emperor ... ... ... ... | 1 | 0 | ,, |
| Fleming's Trentham Hybrid ... ... | 1 | 0 | ,, |
| Duncan's Green-flesh do. Improved ... | 1 | 0 | ,, |
| Hampton Court Green-flesh ... ... | 1 | 0 | ,, |
| Egyptian do. do. Improved ... ... | 1 | 0 | ,, |

Any quantity of the above will be sent postage free to any part on receipt of a Post-office order, or the amount in penny postage stamps.
Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

SUTTON'S LETTUCES AND CUCUMBERS.

JOHN SUTTON AND SONS, SEED-GROWERS, Reading, Berks, have much pleasure in referring their friends to the description of their superior sorts of Lettuces, given by the Editor of the *Gardeners' Chronicle*, in March last, which will be seen in Messrs. SUTTON'S advertisement on the last page of the *Gardeners' Chronicle*, of January 25. Also, the following extract from a letter just received:—
"MESSRS. SUTTON AND SONS:—Gentlemen,—I have grown all the sorts of Cucumbers which I have seen advertised, but the 'Conqueror of the West' is far before any other in my estimation. I have now grown it several years, and intend to grow none other this season. Your Lettuce, too, is excellent, and certainly I have never seen any sort so large. I have observed that it is not so apt to run to seed as others, which renders it very valuable in hot dry summers, and for autumn use."—*From Mr. Smithers, Head Gardener to the Earl of Carnarvon, High Clere, near Newbury.*
*N.B. These Lettuce Seeds will be sent free by post on receipt of postage stamps in payment, in good-sized packets, at* 1*s. each; but the stock having become very short, they cannot now be sold by the ounce.*
The CONQUEROR OF THE WEST CUCUMBER is 2*s.* 6*d.* per Packet, or three seeds for 1*s.*

SEEDS OF THE BEST QUALITY, CARRIAGE FREE.

J. C. WHEELER AND SON have had the honour of being appointed Seedsmen to the Gloucestershire Agricultural Association. Their Priced List of Seeds for this season is just ready, and will be forwarded free by post to any address on receipt of two postage stamps. This Catalogue is not a long list of useless names; it is really what it professes to be, a List of the best Seeds in cultivation, and will be found a safe guide to all purchasers.
Dr. LINDLEY, in the *Gardeners' Chronicle*, of the 2d March last, strongly recommends it in the following terms:
"THE CATALOGUE OF SEEDS SOLD BY J. C. WHEELER AND CO., GLOUCESTER, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless, incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."
J. C. WHEELER and SON deliver their Seeds CARRIAGE FREE.
Kingsholm Nursery; and 99, Northgate-street, Gloucester.

AN UNLIMITED STOCK OF REMARKABLY FINE SEEDLING AND TRANSPLANTED LARCHES AT REDUCED PRICES.

WM. WOOD AND SON, being very extensive holders of the above, and all other kinds of seedling and transplanted Forest trees, will be happy to furnish prices on application.
N.B. Catalogues of Vegetable, Flower, and Agricultural Seeds, also of Nursery Stock, will be forwarded free.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

CHEAP PLANTING.

LUCOMBE, PINCE, AND Co. have a large quantity of fine LARCH, SPRUCE FIR, THORNS for Hedges, LAUREL, LAURESTINUS, PORTUGAL LAUREL, &c., all of very superior quality, of various sizes, which, owing to the Lease of one of their Nurseries on which they now grow expiring at Lady-Day next, will be sold at greatly reduced prices.—For particulars of size and prices, apply to the Exeter Nursery, Exeter.

SUPERB RANUNCULI.—The present being the usual month for planting the Ranunculus, we beg to recommend the following selections.
*The new varieties have been selected with great care, of first-rate sorts, from immense quantities of seedlings, and for vigorous growth and free flowering are far preferable to the older varieties. Selections, in strong roots, at the following reasonable charges, with printed instructions for planting and treatment.*

| RANUNCULUS.—*Free by post.* | £ | *s.* | *d.* |

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

LILIUM LANCIFOLIUM, RANUNCULUSES, ANEMONES, AURICULAS, AND PELARGONIUMS.

HENRY GROOM, CLAPHAM RISE, near LONDON, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to recommend to the attention of the Nobility, Gentry, and Amateurs, his extensive assortment of the above FLOWERS. He begs to say that this is a good season of the year to make a selection of the various kinds. Ranunculuses and Anemones should be planted this month.

A Catalogue will be forwarded on application.

DOUBLE ITALIAN TUBEROSE ROOTS, 3*s.* PER DOZEN.

ROBERT HALL, 63, South Audley-street, Grosvenor-square, facing the chapel. Postage Stamps taken in payment.
R. H. begs to remark that his TUBEROSE ROOTS have been left in the ground a sufficient time to mature, instead of, as is too generally the case, being hurried out to secure an early market when only about one-half of them will bloom. Also small Yorkshire Breakfast Hams, 10*d.* per pound.

CLEMATIS TUBULOSA, FROM MONGOLIA.

HUGH LOW AND Co. having a considerable stock of the above-named beautiful free flowering, hardy, suffruticose plant, producing splendid masses of purple flowers during the autumn months, offer strong plants at 1*s.* 6*d.* each, or 12*s.* per dozen.
They also have for sale very fine, healthy bushy plants of CITRUS JAPONICUS, or as it is commonly called, OTAHEITE ORANGE. Wherever this plant is known, it is universally admired, on account of the facility with which it can be made to produce fruit in abundance in a very small state. Price 42*s.* per dozen.—Clapton Nursery, London.

NEW YELLOW WEIGELA MIDDENDORFFIANA, FROM SIBERIA.

HUGH LOW AND CO. have the pleasure to announce that they will be prepared to send out, in June next, plants of the above-named magnificent Shrub, alike suitable for early forcing or the shrubbery, it being perfectly hardy. With the exception of the colour of the flowers, which is a beautiful pale yellow, it bears considerable resemblance to the universally admired Weigela rosea.
Price per plant, 10*s.* 6*d*, with the usual discount to the Trade when more than one is ordered.
Clapton Nursery, London, Feb. 8.

GERMAN FLOWER SEEDS.—Our Selections of the above showy Ornaments of the Flower Garden having for several years given general satisfac ion, we hereby announce the arrival of our annual supply, selected by us in Erfurt from those personally known to us as the most select and careful growers. It includes the most distinct varieties of Stocks, Asters, Balsams, Larkspurs, Zinnias, Wallflowers, and Hollyhocks. They will be made up in 5s. 10s., 20s., and 40s. packets, and each packet will contain part of the whole collection, if not otherwise ordered by th purchaser.

We have also a carefully selected assortment of all the leading and most approved varieties of Vegetable and Flower Seeds, which we offer at the current prices.

A Catalogue of General Nursery Stock stamped, free by post, may be had on application.

HUGH Low and Co., Clapton Nursery, London.

---

LIBOCEDRUS CHILIENSIS, Endlicher (THUJA CHILIENSIS, Don).—A noble Evergreen Conifer, a native of the Andes of Chili and the southern provinces of Antucco and Valdivia, growing to the height of 65 to 80 feet. Sir Wm. Hooker says—

"*It is a tree of great beauty, and well worthy of being introduced into our gardens. There can be little doubt, from its native regions (inhabiting the same elevations on the mountains as the Araucaria imbricata), that it will thrive well in the open ground.*"

The following is an extract from a letter lately received from the well known botanical collector Mr. Bridges:—"In one of the late numbers of the *Gardeners' Chronicle* I see some doubts expressed relative to the Thuja Chiliensis being hardy in England. It will, in my opinion, be perfectly so, judging from what I have seen of the plant in the province of Colchagua, south lat. 35°, which is its most northern limit. It is found near the snow, and where it freezes, I should say, quite as severely as it does in the vicinity of London. Where the tree grows alone it is very graceful, the lower boughs are even on the ground, and it elevates itself to a great height. The timber is esteemed by the natives for building purposes. I have myself seen it as far south as 42°, and I learn it is found in the vicinity of Cape Horn."

Fine healthy well-established one-year-old plants, from seed, in single pots, 7s. 6d. each, three for 21s., or 4l. per dozen.

HUGH Low and Co., Clapton Nursery, London.

---

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2s. 6d. per lb. Also, his superior dark-green Savoy, 1s. 6d. per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

---

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, &c., may be obtained gratis on application. It describes the colour of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections. He has many thousands of Rhododendron ponticum in sizes very suitable for planting immediately into Game Preserves, very healthy bushy stuff, price 5l., 7l. 10s., and 10l. per 1000.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway, and three miles from Blackwater, South-Eastern Railway.

---

RENÉ LANGELIER, of the Clarendon Nursery, St. Helier, Jersey, begs to draw the attention of the Public to his still unrivalled collection of PEAR TREES, not yet surpassed in Europe, in which will be found all the very best varieties insured for the season required. Trees may be had already formed, either pyramidal or for espalier, in unusually fine and healthy condition, such as will give the most ample satisfaction to both purchaser and R. L. The price has been much reduced, and the quantity of Trees R. L. possesses enables him to supply the trade with guaranteed sorts equal to any house on the Continent, having given the greatest satisfaction for several years. Foreign correspondents will find a very great advantage if the selection is left to R. L., as they will be cheaper, and none but the best sorts will be supplied.

R. L.'s Descriptive Catalogue, which has been found the best and most correct yet published, is only to be had at his Nursery, Jersey, price 1s. 6d. and 6d. extra for postage.

A very great reduction has been made in the transit by steamers to all parts of England, so that R. L. can supply Trees cheaper than any other grower.

A fine collection of Roses, Camellias, and yellow Picotees.

---

HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENTS, MAIDSTONE, AND ADJOINING THE SOUTH-EASTERN RAILWAY STATION, ASHFORD.

WM. JAS. EPPS begs to state that he has taken the Nursery and Seed-growing business late in the occupation of Mr. James Cutbush, Sen., adjoining the Railway Station, Ashford, where he is making extensive alterations for carrying on the above business, in conjunction with his Nursery and Seed Establishment, Maidstone. The proximity of the Ashford business to the Romney Marsh (which is the largest and by far the best seed-growing district in the kingdom), will enable him to offer many advantages; great attention will be paid in selecting and growing the stocks true to their kind. He is now prepared to receive commissions from any respectable wholesale house. The prices, per contract, this year are exceedingly low, and any further information upon this subject may be had upon application, also his wholesale and retail List of Seeds.

W. J. E. has a large and splendid stock of the following Seeds, which he can warrant to any extent, and at very low prices—terms, three months, upon satisfactory reference—Skirving's Purple-top Swede, Laing's Purple-top Swede, Mangold Wurzel, White Carrot, Parsnip, Champion of England Peas, Imperial, Victoria Marrow, Blue Prussian, Broccoli, and Cabbages of sorts; Kohl Rabi and Mustard. All seeds carriage paid to London.—Feb. 1.

---

J. G. WAITE'S CATALOGUE OF VEGETABLE SEEDS is now Ready, with Prices to suit the times, and can be had on application.

181, High Holborn, London.

---

J. G. WAITE'S CATALOGUE OF FLOWER SEEDS is also Ready, and can be had on application.

181, High Holborn, London.

---

SION-HOUSE DWARF FRENCH BEAN, new, early, buff speckled. This is the earliest Bean known, and can be had in any quantity, price 21s. per bushel.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London, where every other kind of Seed in cultivation can be had, on better terms than at any other House in the Trade.

---

RHUBARB ROOTS TRUE TO NAME.—Myatt's Victoria, 6s. per doz.; Myatt's Linnæus, 9s. per doz.; Mitchell's Albert, 9s. per doz.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

---

STRAWBERRY PLANTS.—Kidley's Goliah, 10s. per 100; Myatt's Eleanor, 4s. per 100.—At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

---

NEW GIANT ASPARAGUS PLANTS, 5s. per 100. LARGE GIANT SEAKALE PLANTS, 8s. per 100.

At J. G. WAITE'S Seed Establishment, 181, High Holborn, London.

---

PEARS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, Clarendon Nursery, St. Helier, Jersey, Channel Islands, begs to offer the following new PEARS, of the first merit:

BEURRE CLAIRGEAU, bearing the name of the raiser of this valuable Pear.—A very large fruit, perfectly melting, and a late fruit of first merit. Price 5s.

BEURRE D'HIVER.—Also large, and keeps till April, perfectly melting, hardy, and great bearer. Price 5s.

BEURRE NANTAIS.—The earliest Pear known, excellent, and great bearer. Price 2s. 6d.

The above R. L. can strongly recommend. None will be forwarded to unknown correspondents except on the receipt of cash or reference.

---

PEAR AND QUINCE STOCKS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, St. Helier, Jersey, begs to inform the Public and the Trade that he has the following, of very superior growth, to dispose of:—A few thousands QUINCE, very free and healthy, fit to receive the buds next July, at 40s. per 1000; also PEAR Stocks, of superior growth, two years transplanted, and very vigorous, at 40s. per 1000; smaller ditto, transplanted, and very vigorous, at 35s. per 1000.

This is an opportunity R. L. has never before offered to the Public, for his stock is totally different from the French stock, which has always given R. L. superior growth of trees.—Orders will be punctually attended to. Reference or remittance from unknown correspondents.

---

THE PLANTING SEASON.—WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON having still on hand a very extensive and superior stock of ROSES, will be happy to supply collections as under (the selection of sorts being left to themselves). The plants are remarkably strong and healthy, and none but first-rate kinds will be sent.

| ROSES. | Per dozen. |
|---|---|
| Extra tall Standards, budded with from 3 to 6 best varieties on a stem ... ... ... ... ... | 42s. to 60s. |
| Extra superior selected Standards ... ... ... | 18s. to 24s. |
| Fine Dwarfs and Dwarf Standards ... ... ... | 10s. to 16s. |
| Superb do. do. (for exhibition) ... | 18s. |
| Fine Dwarfs, on own roots, in 50 varieties, per 100 ... | 50s. |
| Good do. do. without names, per 100 | 30s. |

N.B. A liberal quantity of plants will be given over with each order. Catalogues free on application.

---

SAMUEL FINNEY AND CO.'S CATALOGUE OF SEEDS, for 1851, is now ready, and may be had postage free, on application. It contains a Select List of all the most approved sorts of Culinary Vegetables in cultivation. Also an extensive collection of Flower Seeds, including the imported German kinds, with descriptions, stating the proper time for sowing, hardiness, duration, height, time of flowering, and the colour of each, with much other useful information. The collections of Seeds sent out last year by S. F. and Co. having given general satisfaction, they again offer them as under.

VEGETABLE SEEDS.—CARRIAGE FREE.

We prove the growth of each kind before we send them out.

---

KNIGHT AND PERRY have great pleasure in soliciting the attention of their Patrons to their NEW LABURNUM, L. AUTUMNALE, which, from its peculiar property of FLOWERING PROFUSELY THROUGHOUT THE AUTUMN, must be considered one of the most important as well as most beautiful acquisitions that has been made. They are supplying good plants of it at 10s. 6d. each.

KNIGHT and PERRY have also a good and healthy stock, their own growth, of most of the new and rare Trees and Shrubs, especially the former, which they have, by diligent research, collected from the Continent and other parts. Their average price is about 30s. per dozen.

EXOTIC NURSERY, KING'S ROAD, CHELSEA.

---

NEW RANUNCULUSES, ANEMONES, SEEDS, &c.

CAREY TYSO, FLORIST, &c., Wallingford, Berks, begs to announce that this is the season for planting, and that he can supply strong Roots, *per post*, as under:

Albion Nursery, Stoke Newington, London, Feb. 8.

---

WM. DENYER, SEEDSMAN and FLORIST, 82, Gracechurch-street, London (near the Spread Eagle), begs to offer the following:

| | s. | d. |
|---|---|---|
| ASTERS (GERMAN), four splendid varieties saved by an Amateur in this country, warranted to produce all double show flowers ... ... ... ... ... ... | 2 | 0 |
| BALSAMS, very double, saved from one of the finest collections in the country, six beautiful varieties ... ... | 2 | 0 |
| LARKSPURS, double, eight distinct colours ... ... | 2 | 0 |
| STOCKS (GERMAN), very double, six varieties, best and brightest colour ... ... ... ... ... ... | 2 | 0 |

The above four collections, all in sealed packages, for 7s., or separately at the prices quoted.

W. D. has just received, from a large continental grower, a fresh supply of GLADIOLUS GANDAVENSIS, 6d. each, or 5s. per dozen—the beautiful dark variety, extra size roots.

A descriptive and priced catalogue of Flower and Vegetable Seeds, &c., may be had on application.

---

THE BLACK AUSTRIAN PINE.—"PINUS AUSTRIACA."

LUCOMBE, PINCE, AND Co. have a large and healthy stock of this most desirable Pine, exceeding 300,000, from 9 inches to 3 feet high, which having been frequently transplanted, are well rooted and safe to remove, they can offer them, varying according to age and quality, from 20s., 40s., to 60s. per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils; growing rapidly and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds.

Exeter Nursery, Feb. 8, 1851.

---

BRITISH QUEEN POTATO.—A new and superior variety, as early as the SHAW, and quality of the REGENT, coming in a month before that kind. The grower says:—"I planted them last year close by a good stock of Shaws; they were quite as early, and, when each were full grown, the BRITISH QUEEN were worth considerably more money, being much like a Regent, and ready nearly a month before it. My salesman considers them preferable to any Potato he ever saw. They grow short haulm and in a clus er, and will admit of being planted closer together than most sorts."

To be had only of NUTTING and SONS, Seedsmen, 46, Cheapside, London, at 9s. per bushel; where may be had every approved kind of Agricultural, Horticultural, and Floricultural Seeds.

NEW SEEDS.—POSTAGE FREE.

ORACH, *strongly recommended by Dr. Lindley in the leading article, Jan. 25th.*

ENFIELD MARKET CABBAGE, *strongly recommended by J. Edwards, Esq., Holloway (See Chronicle for February 1st.) Our Original Stock of this Variety was procured from Mr. Charles Farnes. 6d. per packet.*

CUTHILL'S BLACK SPINE CUCUMBER, from Mr. Cuthill, 1s. per packet.

CUTHILL'S SCARLET-FLESH MELON, from Mr. Cuthill, 1s. per packet.

MYATT'S TREBLE GARNISHING PARSLEY, saved by Mr. Myatt, 1s. per ounce.

MYATT'S TRUE WALCHEREN BROCCOLI, saved by Mr. Myatt, 1s. per packet.

RENDLE'S SUPERB WILLCOVE BROCCOLI, *own saving*, 1s. per packet.

MITCHELL'S MATCHLESS WINTER PARSLEY; *the hardiest and best winter variety. 6d.* per packet.

RENDLE'S EARLY ADMIRABLE CABBAGE, *own saving, 6d.* per packet.

COLE'S SUPERB RED CELERY, *first-rate variety, 6d.* per packet.

TRUE CASSABAR MELON, *presented by the Pacha of Egypt to Lieut. Tancock, 2s. 6d.* per paper.

*** ALL THE ABOVE POSTAGE FREE.

All the newest and best vegetables grown can be procured from WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

GEO. SMITH has much pleasure in offering his superb SEEDLING VERBENAS, FUCHSIAS, and PETUNIAS, which have been so universally admired. Strong Plants will be sent out the third week in April. Early orders earnestly solicited.

VERBENAS.

ENCHANTRESS (Smith), a superb flower, pip large, smooth, and flat; colour, an exquisite shade of pink, flushed with brilliant salmon rose, with a splendid eye of bright lemon green, a compact and noble trusser. A first class certificate at the Royal South London, North London, and the London Floricultural Societies, also the premier prize as the best light Seedling of 1850.

BRITISH QUEEN (Smith), a splendid flower; colour delicate white, with rosy purple centre, pink eye, a fine trusser, smooth on the edge, one of the finest fancies raised. Was awarded a first-class certificate at the Royal South London and North London Societies, and a premium and certificate at the London Floricultural Society, as the best fancy of 1850.

EXQUISITE (Smith), brilliant rosy lilac; centre pure white, eye very desirable, pale lemon, of excellent form, smooth on the edge, large size, a noble and compact trusser, extra fine. A first-class certificate at the London Floricultural, Royal South London, and North London Societies, and Grecian Saloon.

SHYLOCK (Smith), a most exquisite flower; colour cerise, or vermilion scarlet; eye pale lemon, very large pip and perfectly smooth—the gem of the season. Received a first class certificate at the Royal Chelsea, London Floricultural, Grecian Saloon, Royal South London, and North London Societies.

KING (Smith), colour a deep rose, with carmine centre, pips extra size, and a larger trusser than any Verbena known, with compactness—a rival on St. Margarette, or any other in its class. A first class certificate at the Royal Surrey Gardens, Grecian Saloon, London Floricultural and North London Societies.

OTHELLO (Smith), a magnificent crimson, blotched with rich purplish red, centre splendidly suffused with crimson lake, eye creamy white, large, and by far surpasses any in its class. Was awarded a first class certificate at the London Floricultural Society, and the premier prize as the best dark Verbena of 1850. A first class certificate at the North London Society, &c.

GRANDIS (Smith), a remarkably beautiful flower of salmonish rose of extreme brilliancy, with fine distinct lemon eye; an excellent trusser. First class certificate at the London Floricultural and North London Societies.

LADY OF THE LAKE (Young), a superb white, burnished with a silvery tint, pale lemon eye, with an elegant circle of beautiful rose surrounding it; a noble trusser. First class certificate a the Royal South London and London Floricultural Societies.

VOLTIGEUR (Smith), pip large, round, smooth on the edge, and perfectly flat; colour superb purplish rose of exquisite shade, white eye, and noble trusser. First class certificate at the London Florticultural and North London Societies.

ELIZA (Smith), colour blush, with rosy purple centre, eye pink, extra large truss, very attractive and fine habit.

PRINCE OF WALES (Smith), a delicate pearl colour, finely blotched with crimson, large and showy, good habit.

WONDER (Smith), colour silvery lilac, with a beautifully rosy purple centre, eye pink, very large, and finely arranged trusses.

The set of twelve will be sent out at 2*l.*, or six at 1*l.* 5*s.*, and at 5*s.* per plant.

G. S. is willing to exhibit six or eight from the above against an equal number of new varieties, to be sent out in 1851, for 10*l.*, in July, either English or Continental.

FIRST-RATE SEEDLING FUCHSIAS.

SIDONIA.—Tube and sepals blush white, well reflexed and tipped with green, corolla violet purple, large and circular. This variety is in the style of Venus Victrix, thrice the size, and free in growth. It has been highly recommended by the Editor of the *Gardeners' Journal*, and also by Mr. Glenny, as being the greatest novelty he has seen. A free bloomer and fine habit. 7*s.* 6*d.*

ALPHA.—Tube and sepals rich red and well reflexed, corolla fine purple; this flower is the largest known, with good contrast; of first-rate habit. A fine show flower. 5*s.*

PSYCHE.—Tube and sepals pure white, well reflexed, corolla rosy scarlet. Free bloomer, of full size and excellent habit, similar to Dr. Jephson. 5*s.*

PETUNIAS.

ATTRACTION (Young), richly veined with brilliant puce on a delicate blush ground, throat round and very dark, extra fine form. Awarded two first class certificates at the Royal South London Society, and one at the Camberwell Society.

ROSY CIRCLE (Young), a beautiful glossy rose, with a large pure white throat, extending over one-third of the corolla, flower flat and full size. First class certificate at the Royal South London and London Floricultural Societies.

CRIMSON KING (Young), very dark crimson, throat jet black, which is very large and conspicuous, the corolla is round, flat, and of great substance, very large and fine. A first class certificate at the London Floricultural Society.

STRIATA (Smith), rosy blush, beautifully striped with rich purple lake, throat dark, the corolla round and flat, a splendid striped variety. Was awarded a first class certificate and the premier prize as the best striped seedling of 1850, at the London Floricultural Society, a first class certificate at the Royal South London, also at the North London and Camberwell Societies.

GRANDIS (Parsons), crimson purple, most beautifully veined with black, perfectly circular and very large, the finest bedder ever offered.

The above at 3*s.* 6*d.* each, or 15*s.* the set.

G. S.'s Catalogue of Verbenas, Fuchsias, Geraniums, Dahlias, Petunias, and Chrysanthemums, will be sent on the receipt of one postage stamp.

Tollington Nursery, Hornsey-road,
Islington, near London.

GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN RAILWAY SEED ESTABLISHMENT,

FOR SUPPLYING GENUINE HOME-GROWN SEEDS, CARRIAGE FREE

SUTTON'S COLLECTIONS OF GARDEN SEEDS.

*For the convenience of Gentlemen who may not be well acquainted with all the best kinds of Garden Seeds, and the proper proportions of each generally necessary to stock a large or small Garden,* Messrs. SUTTON *have during the last seven years been in the practice of making complete Collections for one year's supply, the economy and other advantages of which system have been fully appreciated by the purchasers, as indicated by numerous recommendations and annual increase of orders.*

| | £ | s. | d. |
|---|---|---|---|
| No. 1. A COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS FOR A LARGE GARDEN, for one year's supply ... ... ... ... ... ... | 2 | 10 | 0 |
| No. 2. A COMPLETE COLLECTION OF DITTO, in quantities proportionately reduced ... ... ... | 1 | 10 | 0 |
| No. 3. A COMPLETE COLLECTION OF DITTO, equally choice sorts ... ... ... ... ... | 1 | 1 | 0 |
| No. 4. A SMALL AND CHOICE ASSORTMENT OF DITTO ... ... ... ... ... ... ... | 0 | 12 | 6 |

Persons who are already in possession of several kinds of Seeds are requested to send the names, that they may be omitted in the collections they may order, and additional quantities of other sorts will be given in lieu of them.

*For particulars of the sorts contained in these Collections, see Advertisement on the last page of the* Gardeners' Chronicle, *of January 25.*

JOHN SUTTON and SONS are also extensive growers of early Potatoes, and Agricultural Seeds, particulars of which may be had by post.

*Reading Seed Warehouse, Reading, Berks.*

EARLY SEED POTATOES, &c., packages free, and carriage to London, if One Pound value, from ABRAHAM HARDY and SON, SEED-GROWERS, &c., Maldon, Essex.

| | Bushel. | Peck. |
|---|---|---|
| Dwarf Frames, Victoria, Albert, and Forty-fold ... ... ... ... ... | 3*s.* 8 | 1*s.* 0*d.* |

| Prolific Rounds, Cockney, Golden-cluster, and Shaw ... ... ... ... ... | 3 0 | 0 10 |

H. and S. confidently recommend the above.

Selected Potato Seed, Early Round, or Kidney, 6*d.* per pkt.
Treatise on Potato Culture, 6*d.*
Heracleum giganteum, roots, 1*s.* each, seed, 6*d.* per. pkt.
Priced Retail Seed List, on application. See Advertisements, January 26, and February 1.
} Post free.

TO BE SOLD, a decided bargain, about 100 Standard PEAR TREES, first-rate sorts, true to name, seven years from graft in a bearing state. This being the most desirable season for transplanting, and root pruning having been carefully attended to, they will move with great certainty. Also two GREENHOUSES, 35 feet by 12 each, recently built, in good repair, the grounds being required for public works.—Apply to T. STREACY, Florist, near the Station, Hackney.

Train from Fenchurch-street, every 10 minutes.

ESCHOLTZIA ALBA.

JOSEPH EVANS has great pleasure in offering the above new and beautiful Annual, which he has flowered the last two seasons, and which has been greatly admired. J. E. begs to call attention to the favourable notice of it in the *Gardeners' Chronicle* of August 10, 1850, and the *Cottage Gardener* of August 15, 1850. J. E. will commence sending out packets of 20 seeds, at 2*s.* 6*d.* per packet, postage free, on and after Monday, February 17. A remittance from unknown correspondents is respectfully requested.

Rosina Garden, London-road, Cheltenham.

PITTDOWN NURSERIES, MARESFIELD, SUSSEX.

JAMES MITCHELL begs to announce that he purposes sending out in May, in strong plants, his superb new Dahlias, also all the leading varieties of other growers.

MITCHELL'S QUEEN OF BEAUTIES.—This novel and extraordinary flower has one of the most rich and beautiful Rose tips ever seen on a pure enamel white ground, two-thirds of a globe, with an outline smooth and round; very double, very symmetrical, the eye level with the surface, and has been admired by everybody who has seen it. It obtained a first-class certificate at the Royal South London Show, the Grand Annual Trial Show, at the Grecian Saloon, also at all the principal shows in Sussex and Kent—4 feet, 15*s.* per plant.

MITCHELL'S ELEGANTISSIMA.—This is also an extraordinary novelty, a fancy variety, marked with tortoiseshell, and perfectly unlike everything that has been seen before. This also had a certificate at the great Trial Show, on the ground of its novelty—4 feet, 10*s.* 6*d.* per plant.

NEW SEEDLING PANSIES—"COMMANDER-IN-CHIEF" AND "PRINCE ARTHUR."

YOUELL and CO. beg to announce they are now prepared to execute orders for the above first-rate PANSIES, which they guarantee will give the highest satisfaction.

"COMMANDER-IN-CHIEF" was exhibited at the Worton Cottage Meeting of May 29th, under the initials of "T. T.," and the following opinion is given in "Beck's Florist" of July last: "No. 2, Yellow ground, bronzy purple top petals, lower ones margined with the same colour, bold eye, showing to great advantage: *a fine flower for Exhibition.*"

The following opinion of this fine flower is also given in the *Gardeners' Chronicle*, of June 20th, under the initials of "Y. Y." "No. 2, Rich yellow ground, top petals dark maroon, lower petals margined with the same colour, eye good; a full-sized and fine flower."

"PRINCE ARTHUR," white ground, top petals rich dark purple, lower ones margined with the same colour, eye good—flowers large and of great substance.

This was exhibited with "Commander-in-Chief" at the Worton Cottage Meeting, and obtained the following opinion: "No. 38, Style of Optimus, and a considerable improvement upon it, having more ground colour."

Strong plants of the above 5*s.* each, in pots, or per post free if required, and one over to the Trade when three are ordered.

12 Finest first-rate Pansies, including the above, well-established, in small pots, or per post free, for 1*l.*

YOUELL and Co. can also supply

CAMELLIAS, of the newest and best kinds, with flower-buds, 30*s.* per dozen.

ROSES, standard, half-standard, and dwarfs, of the very best kinds in cultivation, 12*s.* to 15*s.* per dozen.

ESCALLONIA MACRANTHA, 5*s.* each.

Royal Nursery, Great Yarmouth.

TRANSPLANTED FOREST TREES NEAR LANCASTER.—On Sale, by private treaty, a quantity of Oaks, Ash, Larch, Highland Pine, Scotch Fir, Spruce Fir, Silver Fir, Sycamore, Beech, and Elms (large and small stuff). Also strong Thorns, Evergreens, and Fruit Trees, on most reasonable terms, on taking a large quantity. The delivery to places near the lines of railway from Lancaster will be trifling. Or delivered, carriage paid, to the nearest railway station.—Apply to the Foreman, at the Leighton Nursery Grounds, near Lancaster.—February 8.

CHOICE FRUITS, &c. &c.—CARRIAGE FREE on all orders of 2*l.* and upwards to any Station on the Eastern Counties Railway; also per Steamers to Hull and Newcastle-on-Tyne direct, forming an advantageous mode of transit to the North of England and Scotland. Planters are respectfully informed that YOUELL and Co. possess an extensive stock of strong and healthy plants of the under-mentioned:

FASTOLFF RASPBERRY (true), as originally sent out by Youell and Co., 15*s.* per 100.
Large White do., 21*s.* per 100.
Cornwall's Victoria, 8*s.* per 100.

CURRANTS.—Improved large White Dutch, 5*s.* per dozen.
Large Black Naples 6*s.* per dozen.
Raby Castle, or Victoria (red), 6*s.* per dozen.
Knight's Sweet Red, 6*s.* per dozen.
Knight's Large Red 6*s.* per dozen.
Red Grape, 4*s.* per dozen.

GOOSEBERRIES of the finest sorts, by name, selected for size, combined with flavour, 5*s.* per dozen.

RHUBARB.—Myatt's Linnæus, Mitchell's Royal Albert, and Myatt's Victoria, 12*s.* per dozen.
Youell's Tobolsk, fine, for forcing, 6*s.* to 9*s.* per dozen.

ASPARAGUS.—Giant, strong, 4 years old, for forcing, 5*s.* per 100.
Do. do. 2 and 3 years old, 2*s.* 6*d.* and 3*s.* 6*d.* per 100.

SEAKALE, strong, 1*s.* 6*d.* per dozen.

Apples, Pears, Cherries, Plums, Peaches, Nectarines, and Apricots, of the newest and most approved kinds, selected from the Garden of the London Horticultural Society, and warranted true to name, can be supplied in maiden and trained trees of the finest quality, and forward for bearing.

TO PLANTERS AND CONTRACTORS.—WHITETHORN, twice transplanted (very strong), 7*s.* 6*d.* per 1000.
Do. 1 and 2 years transplanted, 4*s.* 6*d.* and 5*s* 6*d.* per 1000.
Do. 4 years, strong and fine, with an abundance of fibrous roots, as good as transplanted, 3*s.* per 1000, or 12*l.* 10*s.* per 100,000.
EVERGREEN PRIVET, 1½ to 2½ feet, fine and stout, 25*s.* per 1000.

Royal Nursery, Great Yarmouth.

**The Gardeners' Chronicle.**

FEW things in gardening are more generally cultivated than the GOOSEBERRY and CURRANT; they are indeed everybody's fruits, and at this season everyone possessing a garden, however small, will be devoting some little attention to regulating their plantations of these useful plants. We not unfrequently notice these fruits occupying some out-of-the-way corner of the garden, as though they were only a secondary consideration; and even when ranged along the sides of the kitchen garden walks, their branches are allowed to spread out so far horizontally, that the fruit is shaded, and much valuable space is lost. But in some gardens, as those at Trentham, for instance, considerable importance is given to the small bush fruits, by having them either trained to neat trellises, or as standards or pyramids. By adopting such methods, the trees are more exposed to the action of the sun and air, and the fruit is consequently much improved both in quantity and quality, besides being kept perfectly free from grit, which destroys so much of the fruit upon low bushes; while, by the use of half-inch netting, the fruit is secured from the depredations of birds, and the late kinds are preserved for a considerable time after they are fully ripe.

We would not devote the whole of the side borders of a kitchen garden to these fruits, for the Apple and Pear answer admirably for such situations; but would prefer arranging the Gooseberry and Currant bushes by themselves, in such a manner as to obtain the greatest quantity of fruit from the least possible space consistent with a proper admission of sun and air, and so that they could be more easily protected either from birds or weather. Some varieties, such as the Champagne and other upright kinds of Gooseberries, and all the Currants, are admirably adapted for training as pyramids; these we would plant 5 feet apart, along the centre of a border 8 feet wide, having a gravel path 2 feet in width between it and the vegetable compartment. These should be trained to a central stem, 6 feet high, and the side shoots shortened in, so that when the plants have arrived at their full size, they should be of a pyramidal form, 2½ feet in diameter, at the base, and 5 feet high, supported by a stem 1 foot in height. The weeping kinds, such as the Warrington Red, should be trained as standards, with stems 3 feet high, from which the branches spread and hang around, umbrella fashion. These should occupy the side rows of the border, standing opposite to each other, and alternating with the pyramids; filling up the vacant spaces with Strawberries, not in rows but in groups.

A border treated in this manner has the most

orderly and pleasing effect possible; besides which, the economy of the plan is evident, as the pyramids being high, much fruit is obtained; and by placing the dwarfs alternately with them, no space is lost, while the sun has perfect freedom of access to every part of every tree.

A kitchen-garden having the borders along the sides of the principal walks furnished with neatly-trained fruit trees and bushes, has a much better appearance than when the Apple, Pear, Gooseberry, and Currant, are intermixed one with another, and the stronger growing kinds are allowed to overshadow the weaker, by throwing their coarse watery shoots so high into the air as to exclude the sun from everything near them. A few years back the space at Trentham devoted to fruit trees and bushes in the kitchen-garden was reduced to nearly one-half, with the view to growing more vegetables; the Apples and Pears were trained to vase-shaped and bell-shaped trellises alternately; and the Gooseberries and Currants as standards and pyramids. By having the trees planted on a prepared bottom, and carefully root-pruned when necessary, and the branches properly pruned and trained, there is now not only an increased quantity of fruit, but the quality is finer.

No doubt there are parts of this country where Apple and Pear trees grow almost as freely as Willows, and yet ripen their wood perfectly, even when left nearly to Nature; and in such places orchards of considerable extent are formed; but we have in view such situations only as the best of our new hardy kinds of Pears and Apples do not succeed in, and where the gardener is notwithstanding expected to have plenty of fruit. In such circumstances is it that the placing of the various kinds of fruit trees and bushes under as perfect control as possible, becomes a matter of importance not only to the gardener but to the owner.

Another plan adopted at Trentham would be not only economical in kitchen gardens of limited space, but a most agreeable thing, particularly during hot weather. It consists in throwing a light arched trellis of iron about 8 feet high over a walk or walks running south and north, or in any other direction, if the kind of fruit intended to be grown on it is suited to the aspect. Such trellises as these are cheaply put up, and are not only much admired for their effect, but are so readily got at to prune, tie, and otherwise manage the trees, that we look upon this as the very best way of growing the hardier kinds of Pears and choice Apples. The effect of an occasional red Currant planted between the other trees upon these arched trellises is excellent, and is the nearest approach that can be made in the open air in this country to the Vine-covered walks of warm climates, as we sometimes see them represented in old Italian paintings.

---

When it was stated, a few years ago, that certain wonderful discoveries had been made, and that means had been found of extracting all sorts of valuable materials out of Peat and turf; in short, that the bogs of Ireland (instead of being, as now, almost a curse to the country) were henceforth to be regarded as inexhaustible mines of national wealth and prosperity; though the announcement was naturally received by the many with applause and rejoicing, yet, for the most part, shrewd, practical men held back altogether; they were sceptics or entire unbelievers. There is no doubt whatever that, when a really good thing is found out, men are not over anxious to draw the attention of others to what they are about; they go on as quietly as they can, and are content if they make a large fortune themselves, without any great anxiety to call all their neighbours around them, to share in their good luck. When a scheme is greatly lauded, and when the immense profits to be realised are very widely advertised, it is generally known that the scheme is really good for very little; in most cases the fact is, that the original projectors, having found out that it is impracticable, or not likely to give them any immediate return for their money, are anxious, if possible, to get back the whole or part of what they have already expended. In such cases a company is got up, and the merits of the scheme are puffed to the greatest possible degree.

When we remember the vast extent of the Irish peat bogs, which are reckoned to extend over one-seventh of the whole country, or nearly three millions of acres, it certainly is very remarkable that so little has been done to render them useful; for even a slight knowledge of the subject will convince every one that, as a source of national industry, they are of very great value. The absurd statements which were current a few years since, when the value of peat was described in truly Californian language, and when the substances to be prepared from a ton of it were said to be worth scores of pounds sterling, would hardly deceive any one; and no one can wonder that the false and temporary excitement which was raised in the minds of speculators soon died away; but every calm observer must continue to wonder that these bogs are not turned to any real and lasting advantage. Though we do not allow ourselves to be carried away by the golden dreams of the over sanguine, yet we cannot shut our eyes altogether to the value of the substance, the practical uses to which it unquestionably might be applied, and considering the large quantity of it which exists in Ireland, the great importance of it to the nation at large.

A number of ingenious men have, from time to time, turned their attention to the subject, have regretted the waste of so much dormant capital, and have endeavoured in various ways to overcome the practical difficulties which interfere with its general use; but their experiments have nearly all been failures. It is not enough to tell us that the experiment was tried, and that at last the result was perfectly successful, if we find that, after a year or two, the very man who had obtained this successful result abandoned his process, and returned again to some old mode.

The time must certainly come, and the sooner it comes the better, when the true value of peat will be better appreciated, and when it will be largely and profitably employed in various ways. From the bad mode in which it is at present generally prepared, and from the imperfect manner in which it is dried, more than one-third of what is cut is rendered completely useless. This may obviously be prevented by mechanical compression, artificial drying, and protection from the weather when dried. At the present time three distinct processes are practically at work on peat, from each of which, some benefit may be reasonably anticipated; these are, its compression, its distillation, and its carbonisation.

The compression of peat is, in the first instance, a purely mechanical operation, but it is one which modifies the chemical properties of the peat and renders it a much better fuel. By getting rid of the large quantity of water which it contains, and by condensing it into a smaller bulk, either by simple pressure, or by pressure and the subsequent addition of tar or some similar substance, peat is rendered a more powerful and economical fuel; because one of the chief objections to the use of peat as a fuel, where intense heat is required, is its bulky spongy state, which renders it incapable of acting like the denser kinds of fuel.

In the distillation of peat the substance itself is wholly destroyed, for the sake of various matters which are formed during its decomposition. Some 50 years ago Platel and others proposed to distil peat, something in the same way as wood is distilled in the manufacture of pyroligneous acid; the products obtained were excellent peat charcoal, abundance of combustible vapours which were employed to aid the heat of the furnace itself, water, tar, certain combustible oils, and a portion of nitric acid. It is curious to see in the account of these old experiments how closely they resemble the results which are at the present time brought out as new. The chief difference between the new mode and the old one appears to be, that whilst formerly the peat was really distilled, which must be obviously a very expensive process, now it is burnt in a large kiln or close furnace, all the products of its imperfect combustion being caused to pass through a condenser. In this process the cost of apparatus, &c., is greatly diminished; but, on the other hand, the charcoal is lost. It is stated that 100 tons of peat may be burnt or distilled in such a kiln in 24 hours, and that exclusive of four tons of ash, and an enormous volume of combustible vapour, it yields enough ammonia to make a ton of sulphate, enough acetic acid to make 14 cwt. of acetate of lime, 52 gallons of wood spirit or naphtha, and more than 1000 gallons of tarry and oily matters. Whether in the face of all this, the plan turns out a profitable one, and really *pays*, remains to be seen.

As in the distillation of peat, the charcoal is burnt, and the volatile matters only are saved; so, in its carbonisation, the charcoal alone is cared for, and the volatile products are entirely burnt. Various modes of doing this have been devised, the principle being in all, of course, the same. The peat is dried as much as possible, and then, either in its natural state, or after compression, is burnt in a kiln or stove, the supply of air to which is under thorough control, so that when the peat ceases to flame, and it is therefore known that all volatile matter is driven off, the access of air can be at once shut off, and the peat charcoal allowed to cool. There is no question that the charcoal thus obtained is an excellent and powerful fuel, particularly that prepared from the compressed peat. Its absolute value must of course depend on the cost of other sorts of fuel, and on its purity; but, for some purposes, good peat charcoal is no doubt preferable to most other kinds of fuel, even though the latter could be had at less cost.

Peat charcoal is also valuable as an element of manure, for which some of its properties eminently fit it. It appears to possess the property of absorbing gases to a very considerable degree, a power to which its peculiar open porous nature greatly contributes. The value of charcoal as a constituent of the soil depends almost wholly on its physical condition; for a dense charcoal, like plumbago, is of little or no use; and the more cellular and porous it is, the more serviceable it is to plants, acting as a constant magazine of gaseous food. Peat charcoal, for horticultural purposes, will probably be found of great use by the gardener, both as an addition to soils, and also in the formation of manures. In the preparation of various composts, and in reducing night-soil and similar fetid waste matters into a portable and convenient state, its value is considerable. That it can be so used with very great advantage there is no doubt; the only question is, whether it can be supplied at a sufficiently low price. It is the interest of those who make it to sell it at the lowest figure, which leaves them a profit, and not to try and give it a fictitious value, by comparing it with guano, or any similar manure. Really good manures are not unfrequently altogether kept out of the market by this foolish system of standing out for a fancy price, instead of looking only for a small profit and a large sale. As a disinfecting agent, peat charcoal will be peculiarly valuable, because we are certainly still in want of a good, efficacious, and economical mode of removing the smell of night-soil; and a great deal of good manure which is now lost altogether, would no doubt be saved and usefully applied, could its offensive odour be thus removed.

---

## MARKET GARDENING ROUND LONDON.

No. VI. Asparagus. — There is but one kind of Asparagus. A Mr. Grayson, an extensive grower on the south bank of the Thames, introduced what he called his "Giant" Asparagus; but it proved to be only the usual kind. He made it a "giant" by putting mould over a few of the very largest heads he could find on his extensive beds, which covered about 30 acres. The heads were cut and shown in market as a new sort. They were about 13 inches or more in length, and 100 heads weighed 42 lbs.; but unfortunately, like other Asparagus, only 3 or 4 inches were fit for eating. There can be no doubt that the present plan of saving seed from the strongest plants has much improved Asparagus. Immense quantities of roots are forced on 2 feet of dung in trenches, having 6 inches of mould to plant in. These are then hooped over, and blanched, to make it look fine and white; the beds are prepared by putting on an immense quantity of manure, and trenching the ground 3 or 4 feet deep, mixing the manure as the work proceeds. In March the ground is measured out after the following manner. Suppose that a fence runs south and north, or otherwise, 3 feet is allowed between it and the first row; a drill is drawn about 2 inches deep, and the seed is sown thinly—say 6 inches or a foot apart, which gives choice of drawing out the weakest, in order that the permanent crop may stand 1 foot apart. The next row is sown 18 inches from the one just mentioned; then for the alley and two sides of the bed 5 feet are allowed; then another row of seeds and so on, which gives two rows to each bed. The first year Onions are generally sown all over the ground; the second season Lettuce, or any dwarf growing vegetable that will not choke the Asparagus, and so on until the third year, when the beds are formed out, and a few inches of mould dug out of the alleys and put on the crowns; only a few, however, of the finest heads are cut this year. Autumn arrives, and when the haulm is cut the whole of the ground is forked over, and planted with Cabbage, Coleworts, or Winter Greens; then in spring the beds are largely supplied with mould out of the alleys, covering the crowns from 8 to 10 inches deep. The finishing of the cutting must be left to the grower. A fair crop of heads must be left after four or five weeks' cutting, in order in some measure to strengthen the young buds for the next year's growth, and to restore to the roots what has been taken from them in the shape of a crop; but not one head must be allowed to grow until you leave off cutting entirely at the end of the fourth year. When the haulm gets ripe it is all cut down, and the mould thrown into the alleys, and there enriched, and the whole of the beds and alleys are planted again with Cabbages, Greens, &c.

Seakale.—This is propagated by roots, or portions of them, after the following manner:—Towards spring, after the produce has been all cut out of the hooped beds, the roots are removed, all the "thongs" are cut off, and laid in large heaps; and as soon as the cut part or upper portion becomes calliced, ground is prepared for its reception, by manuring and trenching. The roots are then planted out a foot apart, in rows 18 inches asunder, and a crop of Lettuces is planted between them; as soon as the buds become visible, all are cut out, except the strongest, the ground is kept clean, and nothing more is done until November, when forcing is commenced. Then all the frames are removed, the dung and mould where Cucumbers grew during summer are taken away for Cabbages or Coleworts. The trenches,

which are 2 feet deep, are again filled with hot dung, and mould to the depth of 8 inches is put on the dung. The Seakale roots are dug up, all the small buds round the main eye are pared off, leaving that by itself, which induces it to push stronger and finer; and now planting is commenced, a furrow is cut out by the spade across the bed, and they are put in as thickly as possible. Five feet across will hold from 25 to 30 roots; the next furrow is cut out 4 inches from the last, and so on till the whole is finished; from 4 to 6 inches of straw is placed immediately on the crowns. The beds are hooped over, and straw is put over the hoops; and in this way I have seen 50,000 plants forced during the winter and spring, and by one man. All roots are removed from where they grow in summer, as they can be put in a much smaller compass elsewhere. Such is the way in which this delicious vegetable is grown by market gardeners, who thus bring it on slowly, excluding all air, and producing excellent food. Mr. Martin's plan of increasing Seakale is this: At taking up time all the thongs are cut off before the plants are put in to force. In November the small prongs or end roots are at once cut into 4-inch pieces and laid altogether in a heap for the winter. In February they are deposited thickly in beds,* and covered with mould an inch deep; when sprouted it is seen by the buds which is the top, and by the roots which is the bottom. The ground being prepared, they are planted out as above. This last plan makes finer plants, as the whole of the strength is in the roots when cut off in winter, which is not the case after they have produced a crop. After forcing, the pores of the thongs must be empty, and they take a long time in recruiting. *James Cuthill, Camberwell.*

## BRITISH SONG BIRDS.

[Cage Birds, No. I.]

No. XVII.—It will have been observed that, throughout our remarks connected with an aviary, I have only given an occasional hint, *en passant*, touching the habits, peculiarities, and dispositions of some particular birds; reserving for a future opportunity, which at present offers, a more minute discussion on the subject at large. What now lies before us is still more generally interesting, though not one whit more important, than what has preceded; nor can the two subjects be disunited.

It would be quite unnecessary to travel out of our road, to select any particular songster to commence with; as ALL will receive due notice in turn. However, as the *Canary* is associated with my earliest and happiest reminiscences, and as certain of his tribe have been my constant companions from boyhood upwards, I feel inclined to give *him* precedence over all others. Our first consideration will therefore be of—the CANARY.

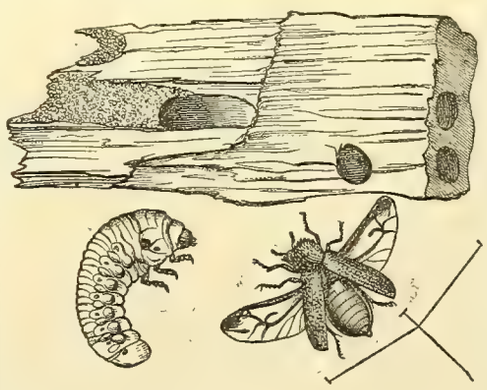
Of all birds, this appears to be the general favourite. There are very few families, comparatively speaking, in which he is not to be found domesticated. Nor is it to be wondered at; for his natural disposition is to be friendly and affectionate, and he will sing *any where*.

Although originally a native of the Canary Islands, the canary has been so long "naturalised" in this country, that he may truly be pronounced an English bird. When first introduced here, he was very tender, delicate, and difficult to rear; but the race are now robust, and among the heartiest of the feathered tribe, if properly tended.

The great marts which supply London and the provinces with canaries, are—Norfolk, and some parts of Yorkshire. The Norwich birds are celebrated for their high colour, and freeness of song; also for their liveliness, and trim plumage. The Yorkshire birds are splendid songsters; but they are not handsome, either in form or plumage, and their colours are bad; neither are they so lively as the Norwich birds. However, their voices are infinitely finer, they sing more steadily, and with more harmony; while their constitution is wonderfully strong.

These birds arrive in considerable numbers—very many thousands of them in one week—immediately before the season of Christmas. They are sent to the written order of the various dealers in London, who await their arrival at the railway stations, and attend to their little wants immediately they are delivered into the safe custody of their new masters. The principal dealers reside in Great St. Andrew-street, Holborn, and its immediate vicinity. All persons who are anxious to secure *good* birds, should pay an early visit here.

The best time to select your birds is by gas-light. They will be found all ranged in cages round a large square room. To keep them in a state of excitement, a quantity of Peas are placed in a wooden box, which is then rattled violently backwards and forwards. This noise, for it is nothing better, puts the birds on their highest mettle; and every one of them, resolved on not being outdone, sings bravely against his fellow. This is the time to test your judgment. If you have a fine ear, and a quick eye, you will readily detect the best songster of the lot. Do not be in a hurry, but show a state of the utmost repose; neither let the dealer know where your heart is set. Take at least half an hour before you finally decide. Sometimes a very extraordinary song-bird has a damaged tail, and an otherwise defective plumage. This is *nothing*; if he be in other respects perfect. By drawing his feathers, you can quickly reinstate his beauty. Three short weeks will suffice to regenerate him entirely. By proper management you may pick out a first-rate bird, at a cost not exceeding a crown-piece. If I might advise, I should say, sacrifice colour to accomplishments—you will never repent it. Nature seldom gives us rare beauty and great accomplishments united.



When you have selected your birds, one or more, and looked to their legs and feet, to see that they are healthy and perfect, on no account allow the dealer to touch them, or remove them from their cages. Pay him a "deposit" on the cages, and take the birds away in your hand. You should previously have prepared a "local habitation" for them at home, well furnished with seed and water; and have nothing to wait for on your arrival. When introducing them into their new residences, do not touch them with your hand; but open the door of the new cage, placing the old one *dos-à-dos* against it. Place a lighted candle in front, and your little prisoners will hop in cheerfully, well-pleased at the change—for their late cramped and ill-savoured abode will have had little charms for them. I shall speak of the proper-sized cages, &c. anon.

It will be desirable to hang them up at once, in the place you intend them to occupy. If purchased at the season I have spoken of, the chances are—they will sing within 10 minutes after they have been caged off. The best trait in the character of a canary is, he will sing, place him where you may. These birds very seldom show a sulkiness of disposition; and even if they should occasionally do so, a single Hempseed, or a morsel of Chickweed, would set all to rights in a moment. An amiability of disposition is herein shown, which should put some of us to the blush. Intellect does not always confer wisdom. *William Kidd, New Road, Hammersmith.*

## ENTOMOLOGY.

Bostrichus capucinus, (the Scarlet-back Cowled beetle.)

Before giving an account of another species of beetle, which is occasionally destructive to Oak timber in our dock-yards, it will be serviceable to refer back to our article on the Lymexylon navale (October 26, 1850), for the purpose of making a few additional observations on that species, as well as of correcting one or two typographical errors which crept into it, and to which our attention has been kindly called by Sir Thomas Sabine Pasley, the head of the dock-yard at Pembroke, who furnished us with the materials for our article upon that species, as well as those which are contained in the present article. Amongst the larvæ of the Lymexylon sent us by Sir T. S. Pasley, were two of a much longer and far more slender form than those of the Lymexylon. These, when put into a box with the the latter, immediately commenced destroying them, seizing hold of them by the back of the neck, and eating a hole in them, in which way they killed seven in a few minutes. These larvæ belong to the order Coleoptera, but are quite unlike those of any Coleopterous insect with which I am acquainted, nor can any of my friends, either here or in Paris (whither I took the specimens for the purpose) form any idea as to the genus of beetles to which they belong. The best idea that I can suggest to indicate their form is that of a rather long thick pin. It is curious that these larvæ should seize the larvæ of the Lymexylon behind the head, where they are provided with a swollen dilatation which indeed offers a *point d'appui* for their attack.

The clerical errors in the former article are these: the thick stuff is plank *above* 4 inches thick (not *about*), and the plank is steamed to bend round the bows and sterns (not *stems*) of the ships. A correspondent who has adopted the signature of "Alpha" (*Gardener's Chronicle*, 1850, p. 726) seems to suggest some doubt as to the identity of the larva observed by Mr. G. R. Waterhouse in a living Oak in Windsor Forest, referred to in our article on the Lymexylon (p. 677). That gentleman has, however, since seen the specimens of the larvæ of that insect, sent by Sir T. S. Pasley, and is quite convinced of their identity; and as his knowledge of Coleopterous larvæ is very considerable, there is no reason to doubt his statement, especially as there is no other known Coleopterous larvæ at all like that of the Lymexylon. Hence "Alpha's" distinction between the habits of Lymexylon and Hylæcetus is ill-founded, as he may further see by referring to Ratzeburg's excellent "Forst Insekten," vol. i. If "Alpha" will also take the trouble of referring to our "Introduction to the Modern Classification of Insects," vol. i. p. 274, and fig. 30, 16-19, he will see the curious palpi of the males which he mentions represented, as well as those of the allied genera Hylæcetus and Atractocerus. The suggestion that the males (which alone possess these remarkable branching palpi), may be attached to flowers, is an ingenious suggestion which certainly merits examination.

In the course of last August we also received, from Sir T. S. Pasley, several specimens of another Coleopterous insect which burrows into the Oak in our dock-yards. The beetle is the well known reputed indigenous Bostrichus capucinus, and some of the specimens were found dead in Istrian Oak timber, which had been a few years in Pembroke dock-yard, and others alive in Italian Oak timber, then just landed out of a vessel from Leghorn. These beetles were found in the *timber*, and not in the *thick stuff*, and they do not penetrate deeper than the sap wood. We subsequently (at the beginning of October) received from Sir T. S. P. specimens of the larvæ, and a portion of the wood, showing the burrows of the insect, together with two of the beetles alive. The burrows are circular, varying from one-eighth to one-sixth of an inch in diameter. The great portion of the mischief is, of course, caused by the larvæ, which are thick fleshy grubs, with the body curved and the hind extremity obtuse, having very much the appearance of small specimens of the grubs of the common cockchaffer, except that the legs are much shorter, the body much swollen behind the head and the terminal segment of the body small; the head is also very small, and the antennæ and palpi are short, and not at all prominent; the jaws, although small, are strong. In its general form this larva approaches very closely to that of the larva of the death-watches, Anobium and other Ptinidæ, which also reside in wood, and to which the perfect insect is also allied, although it only possesses four joints in all the tarsi, for which reason Latreille united it with his other Xylophaga, at the end of the family of the Weevils (Curculionidæ.) In respect, therefore, to its position in the distribution of the order Coleoptera, this genus is almost as interesting as Lymexylon, and therefore the knowledge of its larva state is of much consequence. It would be curious to ascertain whether the singular statement of M. Schmidberger, concerning the habits of the larvæ of the nearly allied Bostrichus dispar, given by Kollar, in "Treatise on Insects injurious to Farmers," &c. (Miss Loudon's translation), p. 258, is confirmed by those of the larvæ of B. capucinus. The annexed figure of the larva is about twice its natural length.

The perfect beetle belongs to the family Bostrichidæ, most of the members of which possess wood-boring habits; and as some of the species are upwards of an inch in length, they must commit much havoc in the timber of tropical climates, of which they are mostly natives. Our figure represents the Bostrichus Capucinus, with its wings extended; it is of a black colour, except the wing-cases and abdomen, which are red, the former being thickly marked with impressed punctures; the front of the thorax is rugose and sloping off, forming a kind of hood to the head, which is attached below, and deeply immersed into the thorax, so that when its wings are closed, the insect exhibits a nearly cylindric form, the fittest for inhabiting the burrows made by the larvæ. The perfect insect measures rather less than half an inch in length; and I believe that up to the present time only three specimens have been taken alive in this country; one in London, another near Cromer, in Norfolk (both places where the insect might probably have been imported), and the third from Matlock, in Derbyshire. As the insect is common in France and Germany, there is scarcely any reason to doubt that it is an indigenous, although rare British insect. *J. O. W.*

## GRAFTING.

No. VI.—Section II. General Observations on Cleft Grafting.—This mode of grafting is understood to consist in cutting the trunk, branches, shoots, and even the roots of plants, and making in the section a cleft which generally divides it into two equal parts,* for the introduction of kindred grafts, in order that these may draw their nutrition from the stock during the period of its existence; sometimes the grafts survive the stock in consequence of striking root.

Without following the order of arrangement of those grafts by our great masters, I have united the small number of them which I propose to describe under one point of view; and shall treat of these in two paragraphs.

The first comprehends all those of which the stocks are thicker than the grafts, and for which ligatures may be generally dispensed with. As regards those constituting the second, the parts intended to be joined ought to be of an equal size; some of them the operator will be under the necessity of maintaining in their position by an envelope, or casing of paper; all ought to be secured with cotton thread, india rubber, or other elastic substance. By means of the modes of grafting comprised in these two paragraphs, all the kinds of plants to which these modes are applicable, will unite perfectly by taking the precaution of joining, as exactly as possible, all the parts of the graft operated upon with those of the cleft made in the stock; but above all, especial care should be taken to make their libers coincide;† then cover the other wounded or exposed parts with some plaster, different kinds of which will be spoken

* In some plants, of which the fibres are not strongly united, their trunks, or their roots are sometimes unequally parted, by splitting the sides; this is the case with the Vine, the roots of Dahlias, &c.

† Liber, the line of demarcation which is found between the bark and alburnum of all woody and herbaceous plants; and when the cambium is carried abundantly towards this part, we can separate this line by raising up or deflecting the bark by a slight effort. When this is the case, we then say the trees are in sap. This condition indicates the time when most kinds of grafting should be performed.

of. With regard to those grafts on which the leaves are preserved, we should endeavour to keep them in a moist temperature of between 60° and 75° in a still atmosphere, and not subjected to bright light during a certain number of days, according to the tenderness of their foliage, which ought not to be exposed to the free air until it has been gradually accustomed to it. The places where the modes of grafting detailed in these two paragraphs ought to be performed cannot be fixed here, seeing that some of them ought to be made invariably below the level of the soil, on the under part of stems; others are made on roots, either woody or spongy, separated from their parent tree, and which, after being worked, are planted in the ground, there to maintain their vital state, and feed the grafts which have been placed upon them; at other times, and most generally, we graft at the height of between 4 and 6 inches above the surface of the ground, and progressively; but it very rarely happens that it is necessary to graft higher than 32 feet. The thickness of the stocks, branches, &c., intended for the reception of the grafts mentioned in the first paragraph, varies from one-fifth of an inch to an inch and half. All those approaching the latter size, and those still larger, intended for crown grafting, ought to be roughly cut back in winter, before they exhibit any signs of vegetation.

This operation ought to be performed from 8 to 12 inches above the point marked out for the reception of the graft. The principal object in shortening back in winter, is to retain all the sap for the benefit of the grafts when they come to be joined at the time it is in full movement, and this somewhat precedes that of the scions, as we have stated in speaking of their preservation.

All the latent or adventitious shoots which spring from the stems or branches of grafted trees, ought to be checked, on small stocks, as soon as they make their appearance; but with regard to large subjects the proceeding is different; for until these shoots have acquired the length of 6 or 8 inches, so long their presence is necessary, especially near the grafts, in order to attract or draw up the sap, which would otherwise frequently remain for a long time stagnant in the trunks and roots of large trees; as soon as they have fulfilled this function they should be cut back. The grafts, which till then are somewhat languid, acquire all at once a great development, and cannot, in consequence, sustain themselves without supports. *Translated from the French of D'Albret.*

## Home Correspondence.

*Cottage Border Edgings.*—It does not sufficiently appear, whether your correspondent wishes for a vegetable ornamental border edging or merely something to keep up the earth. Slate, tiles, flints, and freestone, all suffer from the spade, and flints collect weeds, but stoneware if made into tiles, and Peake's terro-metallic, if made 1½ inch thick, would last for ever. Stone and slate are very liable to "open," and any very dark or neutral tint, that is, any tint with blue in it, and not red or brown, is not agreeable as a border to earth, still less to Grass. The colour of the material should be something between dingy yellow and brown; any intermediate tint would do, but of course the colour of the soil would make one or the other superior to the rest; in a light-coloured soil I would use a dark border, and *vice versa*; slate never looks well in the country, our greens are too blue and our skies too neutral; it is never introduced into a painting. *Jay, Somerset.*—I have found an edging of Thyme particularly neat and lasting. I am sorry to say I am not botanist enough to designate it by any other term than the flowerless, sweet-scented Thyme; it is quite a creeper, may be kept to any width by simply cutting off what is superfluous, and it does not harbour any sort of vermin. It has edged my shrubbery border for, at least, six years. If accidentally trod upon, it returns good for evil by its sweet perfume. The time to plant it is April. It flourishes with me in a light gravelly soil. *H. M., Jan.* 30.

*Early Tulips.*—These being now in bloom, an opportunity is afforded of making a selection, and for the amateur of limited means, I know of no more valuable spring flowering plants. They are cheap and easy to cultivate, requiring but little attention; and while they annually adorn the flower clump or sitting-room window, their numbers will increase, until the only difficulty will be to find room for them. They form charming beds during April and May, and from the present time till May they may be easily had in flower for the window. I began with Van Thol, single and double; Rex Rubrorum, Tournesol, Florentine, and Mariage de ma Fille. The outlay for a dozen of each of these varieties did not exceed the cost of a dozen of first-class Hyacinths; and while the latter have to be bought annually, these last for years. The Van Thol is the earliest, and ought to be treated as such, except variety is desired; in that case, take Rex Rubrorum and Tournesol. These are in flower now, and if properly tended with water will retain their gaiety for at least a month. The Tournesol panaché is a somewhat new variety, larger, and more showy than the old Tournesol; but its beauty is of shorter duration. The single variety, called Keizar Kroon, yellow flaked with scarlet, is a noble flower, large and showy. Royal Standard is a pleasing kind, with a white ground flaked with carmine, and the single flower, Belle Alliance, is an attractive red. There is also I believe a new scarlet Van Thol, of which I have no experience; but it is reported to be very fine. The best double white with which I am acquainted is La Candeur, and white Swan and Pottebakker are the best single whites. Amongst yellows, in addition to the dwarf and showy Van Thol, we have the yellow Pottebakker, and the old double yellow rather later in flowering. With the above, together with Crocuses, Snowdrops, Hyacinths, Narcissus, and other early flowering plants, I manage to keep not only my beds but my windows gay all the spring. It is but right to mention, however, that I generally make the bulbs which have flowered in the open ground one season change places with those in the windows, and *vice versa*; for I find that under pot-culture they become weak, and do not flower so well. —*C. F.*

*Planting Waste Lands with Forest Trees.*—I have been tempted to address you on a subject which I think you will agree with me is one of national importance, viz., the eligibility of vast tracts of waste land in the United Kingdom for the production of timber. Not that I would recommend the owner of land to plant forest trees on lands fit for cultivation, as in this country timber can be imported cheaper than it can be grown on such lands; but on our hill and moor ground timber will pay for planting, and it ought to excite surprise that in this enlightened age the planting of trees in such situations does not demand more attention. I have taken the liberty of making an extract from an article bearing on this subject, which appeared in a gardening periodical nearly 20 years ago; but which, to a great extent, holds good to the present time. The writer says—"To what cause then but an unaccountable want of information as to the advantages to be derived from wooded lands properly managed can we account for the necessity which exists for importing timber into a country where for centuries millions of acres of land capable of producing valuable timber have been permitted to remain totally unproductive. When we traverse the wilds of Connemara, or the Grampians, we are incessantly struck with the vast amount of country suitable for the growth of timber. That the hills of Yorkshire and Derbyshire in the north, or the level plains of Hampshire in the south of England, should be suffered to produce Heath instead of Oak and Deal; and that too in a country where unlimited capital exists, and industry only requires permission to exert itself, must be ranked amongst the most extraordinary anomalies connected with the history of the country itself. Ireland, with her five millions of acres of waste land, three-fourths of which is adapted to the growth of timber, and her population perishing for want of employment, presents a picture of bleak desolation not elsewhere to be met with. Lord Melville, in his letter to Mr. Percival, predicts, with good reason, that if this culpable apathy to the interests of the nation shall continue, England will ere long experience a fatal want of an article on which her existence as a nation in no mean degree depends." The following very sensible remarks occur in Mr. John Tuke's "Survey of the Agriculture of the North Riding of Yorkshire:"—"Most people, I think, concur in this point, that for the last half century the wood in this kingdom has been terribly on the decline. That gloomy prospect has now become tremendous, and sufficiently visible to awaken the fears of every thinking person. The axe is often heard, but the planter is seldom seen. Let us cast our thoughts towards the future support and welfare of our navy—our sole protection—and we must tremble at the continual disappearance of our Oak. Some speedy method must be adopted to remedy this great national evil; or, besides the danger from fierce external foes, we must determine to go barefoot: we should never think of looking to foreign countries for a constant supply of Oak bark to tan our leather. Let Britain help herself. Each nobleman and gentleman should insert in the agreement with his tenants a clause to compel them to plant and protect in the corners of their fields, and upon pieces of waste ground, a certain number of good Oak, Elm, and Ash trees annually. These trees should be found by the landlord, and he should enforce the performance of this clause as rigidly as the payment of the rent; then will the rising generation have cause to bless the wisdom and policy of the present age." I think the above remarks need no comments from me, as they carry with them convincing proof of the solid sense of their authors. *A Young Gardener.*

*Useful Fruits.*—One of your correspondents gives a very high character to Chapman's Prince of Wales' Plum, as a fine fruit, and an excellent bearer. So far as the experience of two seasons justifies my doing so, I can fully confirm this statement, though this is a locality where Plums generally don't bear well; but an intelligent nurseryman in this neighbourhood says that this Plum is exceedingly apt to canker and die off, and that in consequence of this failing he has ceased to propagate it. So far, I don't find this to be the case with mine. In speaking of good Plums, none of your correspondents appear to be aware of the exquisite flavour of the purple Gage; it is, in my opinion, very superior to the green Gage; but, in order to have it in perfection, it must hang on the tree until it shrivels; before that time, it is only a second-rate fruit, but when it has hung a week or 10 days after it has become melting, it begins to shrivel, and then becomes by far the richest and sweetest Plum I know, and upon a wall, even in this miserable climate, it will hang on the tree until the beginning of November, and retain its flavour to the last. There is another fruit which I don't see so often mentioned as it deserves to be, and that is the Beurré de Capiaumont Pear; with me it is a most profuse and certain bearer; and if not allowed to hang too long upon the tree, and when gathered, if it be hung up in a warm room until it becomes melting (this is essential), it is only second to the Marie Louise in flavour; but to obtain it in this perfection, the tree must not be overcropped, which is very probable, if it is not most resolutely thinned. *T. G., Clitheroe.*

*Garden Ornaments.*—How many means of creating picturesque effect are wasted by every gardener! How pretty could a common red Grape jar be made to look, if a rough trellis were put across its mouth and a creeper planted in it, with plenty of drainage, with four bricks as a pedestal it would look well, and cost at most only 1*s.* 6*d. Jay, Somerset.*

*Timber Preserving.*—At the back of the house No. 22, Essex-street, Strand, a rail of Oak was, in the year 1771, placed round a flat roof of lead, at a height of perhaps 90 feet above high water in the Thames. The rail was exposed to all the violence of storms from south to the northward of west, the leads being two or three stories above the roofs of the houses in those directions. The rail was composed of an upper and an under bar, each of them might have been about 4 inches in the square, the upper bar rounded off as a hand-rail; into these bars were morticed uprights of about 2½ inches square. Robert Mylne (the architect of Blackfriars-bridge), directed that the whole rail should be left without paint or any other coating for two or three years, to season; it, however, never was either painted or coated in any way between that time and the year 1800, a period of nearly 30 years, and yet it was as sound at the end of it as when first put up. How long afterwards the rail lasted is not known. *M.*——The remarks which have lately appeared on this subject, remind me of the following conversation. Walking one day with the late Mr. Atkinson, of Silvermere, in his grounds near a lake, where he had recently built a summer-house of home-grown wood, I asked him whether he did not mean to give it a coating of something to preserve the timber? He said "No." Would not brushing it over with linseed oil be a good precaution, without altering its appearance? "No; I think all such applications more calculated to induce decay," or words to that effect. He did not enter into the *modus operandi* of the application, nor did I ask him, but such was his opinion. When on this subject, I may mention an instance of durability in naked wood that, some years ago, fell under my own observation. Being engaged in alterations in a garden of which I had charge, it became necessary to remove an old frame-ground, surrounded by a Reed-fence 6 feet high. The rails of the old frame were of Cherry-tree, cut triangularly and fixed to Oak posts. These rails were never either pitched, tarred, nor painted. When taken down, they were crusted over with a brittle crust about one sixteenth of an inch deep, and all besides was sound and hard as bone; an old man who had worked in the garden between 40 and 50 years told me that these rails had been there ever since he had been, and to his knowledge had worn out two sets of Oak posts. Again, I have frequently known green poles of Willow, peeled and used as fencing rails, to last many years, and attain a sort of toughness and durability from exposure, that any one at first thought would hardly expect; and even Ash poles, split and peeled, will last many years; the action of the weather on the outer surface raises a sort of short woolly covering that wards off the rain. So far my observation coincides with some of the remarks of your correspondents on this subject. *Quercus, Jan.* 27.

*Sources whence Plants derive their Nitrogen.*—In your article on this subject you appear to me to have overlooked one source from which they must derive a considerable portion of it. Every student of chemistry is told in the rudimentary treatises on that science that if an electric spark is passed through a jar containing atmospheric air, the latter is converted into nitric acid. Presuming this is true, does not it warrant our supposing that an immense supply of nitric acid is generated by the electric explosions of thunder storms? There must be millions of acres of electric clouds exposed to these explosions, and thousands of hogsheads of nitric acid generated thereby. At least, so it appears to me; but not being a chemist, I may be wrongly informed in the matter. Will you kindly say whether I am so or not? *T. G., Clitheroe.* [Nitric acid is unquestionably formed in the air in other modes than by the oxidation of ammonia; not merely by flashes of lightning, but also, indeed, whenever any substance is burnt in the air. The quantity, however, thus generated is probably much less than that resulting from the oxidation of ammonia. The rain which falls in the most violent thunder-storms contains only a minute trace of nitric acid. It is only in the immediate course of the electric flash that a small quantity of nitric acid is formed; and many thousand electric sparks must pass through a jar of air before an appreciable quantity of the air is changed into nitric acid.]

*Hybridising the Hepatica.*—As the season is arriving when one of our prettiest spring flowers, the Hepatica (Hepatica triloba), will show its bloom, I very much wish again to call the attention of amateurs and some of our leading cultivators to the fact, that there appears to be only five varieties of this charming little plant; viz., single white, single red, double red, single blue, and double blue; and although these plants have been known and cultivated in our gardens for upwards of two centuries, and are also found wild in many of the woods of Europe, yet there appears to have been no attempt made to obtain varieties. The single sorts seed readily, and so does the double white; and as they are raised

without difficulty, and flower the second year, perhaps some one may take the subject up, and be enabled, at no distant period, to obtain varieties of this charming little plant by cross impregnation, as well as of many other plants on which much care has been bestowed, but without half the claim to the merit of this little spring favourite. *George Wood, Rochford, Feb.* 3.

*Bees.*—One of your correspondents, a short time since, related an incident which occurred to a friend of his, who, on removing some bees to a new locality, found them destroyed by the attacks of other bees, and asks, "Whether it might be the 'natives' excited by the dread of famine which perpetrated the mischief?" On reading it I was strongly reminded of some information I received some 30 or 40 years since from an old gentleman in Buckinghamshire, who had kept bees for many years, and had the best and firmest honey I ever remember to have met with. The old gentleman attributed the superior quality of his honey to the honey dew yielded by some very fine Lime trees in the neighbourhood, with which the inmates of his apiary made free. But *àpropos* to the robber-bees: on one occasion I found some of his bees drowned in a tub that stood adjacent to the hive; and on enquiring into the cause of the catastrophe, was informed that an accident had occurred to the queen bee belonging to one of the hives, and that he had destroyed all the bees belonging to it, since those which survived would turn robber-bees, and in that way do serious mischief. *W., Lancashire.*

*Grape Scissors.*—I have frequently seen fine-pointed scissors recommended for thinning Grapes. Now I beg to state that any person (however careful, or steady handed and well up in practice) may often regret having pierced or punctured a prime looking berry when he wished to pass the finer points of his scissors past it to sever the one he wanted away. I have used for two years a pair of scissors one blade of which is probe pointed, the other as fine as can be desired; and can with comparative ease and speed introduce it to the centre of a bunch of Grapes without fear of wounding a berry—then open the blades—grasp and cut the objectionable berry off as close as required. In my operations in thinning Grapes, my curve-bladed scissors with one probe-pointed have saved me a deal of time, which to me, and every one else, is a point worthy of great consideration. *Samuel Swinnerton, Market-Drayton, Salop.*

*Begonia Fuchsioides.*—This plant rarely flowers well until the second year of its growth. Encourage it to attain the size required the first season, but never cut it, rest it like other Begonias, and when you start it for flowering, top-dress it, but do not repot; give tepid water copiously, but if over done the leaves will turn yellow. It likes a temperature of 70° by day, and 60° by night. Under this treatment it will put forth short-jointed flowering branches abundantly. I have had a plant of it in bloom here for these last two months, and another is resting in a cold house for late spring flowering. *W. Culverwell, Thorp Perrow.*

*Market Gardening.*—Mr. Cuthill states that the general crop of Cabbage is sown between the 25th Aug. and the 1st Sept., but it will be found that this crop is sown from the 3d to the 8th of Aug. He also mentions that Cauliflowers are sown about the 20th Sept., but they are always sown between the 21st and 28th Aug. As regards the sort of Celery now in use, he says, "there is no solid Celery grown now, as there was 20 years ago;" but if he will walk over to Deptford I will show him 20 acres, at the commencement of any season, of such Celery as could not be produced 20 years ago. I have some even at this advanced season, as solid as ever he saw it. *J. M., Market Gardener, Deptford.*

*Longevity of the Skylark.*—Mr. Kidd states, in reference to the sky-lark, that he has had them in full song for 14 years. As a proof of their longevity, even when confined in the narrow limits of a small prison-house, I may state that Mr. A. Fry, of Capel, near Tonbridge, has one which has been in full song for 20 years, and, to all appearance, it is as hale and hearty as when first immured in his wire cage, proving that they are undoubtedly happy in their confinement; and they amply repay any pains and care that may be bestowed upon them. *George Fry, Manor-House, Lee.*

*Re-invigorating old Forest-trees.*—Some Ashes that were considered old trees more than 60 years ago, were, as if by accident, made the subject of an experiment. About 20 years ago, when some alterations were making, these trees stood somewhat in the way; and as they appeared to be in an unhealthy state, with a great number of dead branches upon them, sentence of removal was nearly pronounced against them. However, they were allowed to remain. To make up a bank where shrubs were to be planted, a considerable quantity of peat was used, and the roots of the Ash-trees got a good covering of the peat put upon them. It was no wonder that the old trees made little progress the older they grew, for the food in the soil in which the roots were, appeared to be nearly exhausted, and the trees were dying, branch by branch, and the rate at which they were giving way, would have soon made them all fit for firewood. But the peat, although a coarse kind of food, was quickly seized upon by the Ash roots, and, to all appearance, made as welcome as a supply of provisions to a starving garrison after a long siege; for the young fibres were found in clusters among the partially decayed matter that was within their reach. The trees soon assumed a different aspect, a more healthy appearance; they were, as it were, rescued from death of a lingering nature, and started afresh into life and vigour. Their foliage was of dark green, and remained longer on the trees, the shoots were stronger, and the layers of alburnum or sap-wood increased in thickness, although the ground above the roots of the Ash-trees has been for many years covered with healthy evergreens; the Ash-trees still continue to thrive, although the evergreens must deprive them of a considerable part of the food which they ought to have, and also of the sunlight, for the ground is doubly cropped, which is too often the case in different departments of cultivation, as well as in the growing of timber-trees. From the cases I have seen from time to time, of decaying forest-trees becoming healthy, when proper food was put within the reach of their roots, I would be inclined to think that the decrease of the diameter of the trunk, after a certain age, of certain species of trees, is the result of starvation in some shape or another; for, as some one remarks, "a very large proportion of plants appear to be capable of an almost indefinite period of existence, if it were not for accidents and disease, independent of old age." And there is much ground for believing that many accidents and diseases would be prevented, if the natural wants of our forest-trees were better understood, a knowledge of the food they required, of the benefit of sunlight, of the functions the leaves performed; in short, a knowledge of vegetable physiology, and of the agents required for successful culture. In many parts of our country, we meet with a solitary tree, commonly an Ash, or it may be an Elm, or a fine specimen of a Scotch Fir, growing far apart from other trees, and we often wonder how they came there, or were allowed to remain. Sometimes there is a small clump of trees, some of them fine specimens of their kind, others in the last stage of existence, bearing the marks of the buffetings of many storms, and, it may be, a short allowance of provisions. Old age and poverty are ill to bear in the vegetable kingdom, even when they assail the monarchs of the woods, as well as in the animal; they make the strong bend before them. Neglect, and the destroying hands of admiring pilgrims, have wrought the destruction of many a noble plant, and nothing remains for the gratification of future generations, but the spot on which they grew. If our trees could speak, many of them would cry out, "Gentle woodman, spare the tree." When inquiry is made respecting these old weather-beaten trees, of a bygone age, we commonly learn that once on a time a cathouse stood near by, or, it may be, an old farm-steading, and the trees grew near the garden, and they are all that remains to mark the spot where numbers of the human family were born, lived, and died. It may be a long time before much manure can be spared for growing forest-trees; and there are some kinds to which it would do more harm than good, if it were applied, such as the Pine and Fir trees; but much is thrown away, or allowed to waste. If applied to the purpose of arboriculture, there would be both pleasure and profit derived from the application. Many a tree may be seen growing in soils naturally poor, and unfitted to carry heavy timber, without assistance; and trees, considered by many to be in the last stage of existence, may be made to renew their growth; for, give a tree room to grow, and food to live upon, and vegetable physiologists will not be able to tell how long it should live, or how large it should grow. *Peter Mackenzie, West Plean, Stirling.*

*H. H. Treby.*

*Mildness of the Season.*—You may perhaps be interested to hear that I saw on Friday last, the 31st January, in an open garden at Morningside, a suburb of Edinburgh, a Pear tree with one of its blossoms expanded, while the whole tree was bristling with blossoms just ready to open. The tree is one of Mr. Rivers' pyramidal "Marie Louise." Another pyramidal tree of "Sucré Vert," in the same garden, was in an equally forward state. Does this not prove that some kinds of Pears at all events could be forced so as to ripen their fruit a month or two earlier than usual? Would you kindly suggest some cheap means of protecting the blossoms on the two trees above-mentioned, which are trees of some considerable size, or must we give up all hopes of obtaining fruit from the present show of bloom, and trust to a second pushing forth of blossom-buds; and in this case would not the best plan be to strip off all the present flowers, so as not to waste the vital energies of the trees? Θ. I., *Edinburgh.* [We should strip off the flowers.]

*The Shantung Cabbage.*—A correspondent of mine at Shanghae writes to me that he is sending me some seeds of the Shantung Cabbage, which one of the French missionaries had procured in the north of China; he says it somewhat resembles the Savoy in appearance, is of a delicious flavour, and weighs 60 lbs. Do you know anything of this Cabbage? If so, will you be kind enough to say when would be the best time to sow the seeds, so that it would have the best chance of getting through the winter without running to seed prematurely; if it is as good and large as he represents it to be, and if it will grow to the same size in England, it may be an acquisition to the country. *T. G., Clitheroe.* [This has always hitherto run to seed in this country, without forming a heart. It is supposed that August is the right month for sowing it in. The failures have been sown in spring.]

*Dead Leaves.*—I am rather out of season with my question, but ever since the leaf-gathering of the autumn I have been thinking whether any advantage could be gained by keeping the leaves of different sorts of trees by themselves—whether their respective qualities are sufficiently different to make it worth while. We know that the leaf of the Beech is particularly endowed with antiseptic properties. The Oak seems to possess more tannin than most others. I have the means of getting leaves from groups of Ash, Horse Chestnut, Lime, Elm, Oak, and Beech, almost without intermixture. If some of your correspondents would say if their experience has led to any conclusion on this subject, I should be much obliged, and I think it might edify many. *Jack, Castle Carey.*

*Fruit Shows.*—The forthcoming exhibitions for 1851 will, without doubt, call into existence many new competitors, in consequence of the Exhibition for the world's industry. To those intending to show black Grapes, I would just hint that the Dutch or Wilmot's Black Hamburgh is on his march to the great arena; and if you do not possess it, you may (unless you can depend on something great) keep your Grapes at home until they are shown separately. Strength of habit and large berries are its chief characteristics; I may add, its only recommendation. The true Black Hamburgh has no more chance with it than I with Hercules. *Caustic.*

## Societies.

Linnean, *Feb.* 4.—R. Brown, Esq., in the Chair. A letter was read from Mr. Hartmann, a Swede, on the discovery of a manuscript of Linnæus, entitled "Iter Dalecarlicum," in the Museum of the Linnean Society. In this manuscript the details are given of a journey made by Linnæus through the province of Dalecarlia, in the year 1734. Like the published journals of the great botanist, this manuscript gives an account of the physical geography, the agriculture, the economy of the people, and the plants and animals of the province through which he travelled.—A catalogue of recent land and fresh-water mollusca found in the neighbourhood of Nottingham, with notes and observations by J. E. Lowe, Esq., was communicated by Dr. Lindley, and read by the secretary. The President called attention to two genera of plants, Kingia and Xanthorrhea, both natives of Australia, remarkable for a structure adapted to resist the action of fire, which was so unscrupulously applied to them by the settlers of New Holland. In Kingia, the leaves sent down between the true stem and the bases of the petioles which formed the only bark of the tree, a series of adventitious roots, which closely covered the stem, and resisted to the greatest extent the action of external destructive agents. A further development of this structure was seen in the stems of certain Blood-worts, namely, Vellozia and Barbacenia. The other genus, Xanthorrhea, was remarkable for secreting a resinous matter at the base of the leaf-stalks, which, remaining upon the stem, were thus united together so as entirely to resist the action of fire. Transverse and vertical sections of the stems of various species of these plants, with drawings by Ferdinand Bauer, were exhibited to illustrate the President's remarks. Dr. Iliff exhibited specimens of mice, which had been found with an apparently fungous growth covering their head and ears.

## Garden Memoranda.

Mr. Chapman's Forcing Grounds, Vauxhall.—Mr. Chapman has been long and deservedly celebrated as a general forcing market-gardener; his place consists of about an acre and a half, covered with glass erections of all forms, both large and small. The north and east boundary walls are covered with lean-to houses, with the Vines planted along the back wall, and trained down towards the front. In some of the houses they run both ways. The centre of the ground is occupied by span-roofed houses, varying from 30 to 70 feet in length, some run east and west, others south and north. It is surprising to see the famous crops which are pro-

duced in these houses, when we consider that their position is in the very centre of Vauxhall, and in the midst of a dense smoky atmosphere, where often for weeks together the glass is covered with soot and dust, excluding much light, of which, under the best of circumstances, we have little enough in winter. Mr. Chapman has never made what is called a Vine border. His ground naturally consists of a rich, dark, vegetable deposit, in which the Vine grows with the greatest luxuriance, the subsoil being gravel. Under each light are two Vines, with wood from 5 to 6 inches between the joints, firm and finely ripened. He never removes any bark until it hangs loosely, and very little then, for he is of opinion that by leaving the old bark on moisture is absorbed, and the live skin is kept in a more natural state. He paints all his Vines every autumn with a mixture of black sulphur, newly-slacked lime, and soft soap, together with as much soot as makes the composition so nearly the colour of the old bark as to be scarcely distinguishable from it. No insects trouble him, and he has never experienced the ill effects of Vine mildew. He never covers the Vine roots with any heating material, but using, as he does, a large quantity of tan in the production of Mustard and Cress, he covers over his borders with spent tan. In the earliest house the Vines are planted against a wall, whose foundation is not more than a foot deep, consequently, one-half the roots may be expected to be on the outside of the wall, in land belonging to another person. Therefore, no protection could be applied here, and yet the Vines bear satisfactorily. The shoots are already all stopped, one joint beyond the bunches of which there is a beautiful display. The Vines in this house are always sufficiently luxuriant, and differ in no respect from those situated in the centre of the ground where the borders are covered with old tan every winter before forcing is commenced. Requiring, as Mr. Chapman does, so much tan for growing Salads in, he generally starts his Vines with the heat evolved in the fermentation of new tan, which is laid in one or two long ridges along the houses, or in the centre pits where Pines were once grown. A natural and uniform "break" is thus obtained, the heat is then increased, and the Vines progress gradually, and under these conditions, the fruit, even in the worst of seasons, is generally well coloured, while many thousand pots of Strawberries, French Beans, &c., are produced under the same roof. In the centre of one of the houses was a Black Hamburgh, nearly a month in advance of its neighbours, which were also black Hamburghs, and which were all started at the same time. If this early habit therefore proves constant, the variety will be an acquisition. Mint, Marjoram, Basil, and Taragon, &c., are grown largely here. A long span-roofed pit was full of these herbs; but Chicory, and that useful ingredient in a Salad, Lamb Lettuce, were nowhere to be seen. They have unfortunately not yet become favourites with the London public.

## Miscellaneous.

*United States Horticulture.*—The annual value of the product of Horticulture in this country now amounts to nearly five millions of dollars, while that of orchards probably exceeds ten millions. But there is another and yet more pleasant aspect in which to view the commerce in plants. There is a value in a flower or fruit which cannot be estimated in money. It is found in that beauty which exceeds all price; in those odours which breathe fragrance; and in that luscious and delicate taste which nothing but the products of the garden can ever yield. The heathen poets talked of the nectar handed round the tables of Olympus, and the golden Apples in the garden of the Hesperides; but this only proved that they had never seen the Pippins, the Grapes, or the Roses of this western world. The poet who has seen the fruits in a modern garden, will never try his art in calling upon modern imagination for what imagination cannot equal! The part of commerce which is thus above fixed, and to which I now allude, is the trade in *bouquets*, or culled flowers, as the ornament of dress, or rooms. There is not a modern city in which the sale of flowers is not quite extensive. There is hardly a lady who does not wear them, and hardly a gentleman who does not really or professedly pay homage to the refined taste, which has thus associated the graces of her person with the loveliness of flowers! The trade in this branch of Horticulture is rapidly increasing, and of all the fashions to which luxury has given rise, this is one of the most innocent and the most to be commended. In spite of all the artificiality of civic life, there is something in this association, which calls us back to the bloom and beauty of primitive creation! *Cincinnati Horticultural Review.*

## Calendar of Operations.

*(For the ensuing week.)*

GENERAL REMARKS.

Those houses which have not already undergone a thorough cleaning, should now be attended to; and if necessary, the inside of the sashes and rafters should be painted. Late Vineries will now be cleared of their crop; and in these, the cleansing and preserving processes should be applied. The hot-water pipes should not be allowed to rust; but should be thoroughly cleaned, and then while slightly warmed have a coat of paint applied. The furnaces too should be attended to, as shattered and loose bricks about the frames of the furnace doors cause too great a draught, and consequently a waste of fuel. By putting all these matters in order once a year, much after expense will be saved; and no time is more suitable for doing so.

PLANT DEPARTMENT.

Some of the plants which flowered in December will now be commencing their growth, and preparations for potting such should be made. A sufficient stock of all requisite materials should be prepared before-hand; and with regard to soils, this should be particularly attended to. It is in many places a difficult matter to get good peat, but, without it, fine-rooted, hard-wooded plants cannot be grown in perfection. If, therefore, healthy well-grown specimens of these kinds are objects worth trying for, no trouble must be considered too great in procuring suitable soil. As the amount of day-light increases, the temperature of the greenhouses may be slightly raised, particularly in fine clear weather; but be cautious not to excite stove plants, especially hard-wooded ones, until the days are longer, as a much greater difference exists between the light of their natural habitats, and of our climate at this season, than between the latter and that of the countries whence our greenhouse plants are introduced; hence, these last are less liable to be injured by a temperature approaching their own natural one, in conjunction with our own dull atmosphere. Stoves and the Orchid-house should not range higher than 55° to 58° at night; forcing-house, 60°; greenhouse, 40°; Heath-house, 36 to 40°. Take care that no moisture falls on the flowers of Orchids, or their beauty will soon be destroyed. If a speedy development of the flowers of any species which are now showing be desired, they may be removed into the forcing-house.

FLOWER-GARDEN AND SHRUBBERIES.

If our previous suggestions have been carried out, the whole of the beds in this department will now have had their annual dressing, and everything in and about the flower-garden will be wearing a neat and orderly appearance. The shrubberies should next claim our attention, for, when well regulated, they possess a charm at all times; and here there is in every garden much that may be done at this season. The shrubbery, as it is often seen, is nothing more than a confused mass of sickly ill-looking trees and shrubs striving for existence; while, by allowing each plant a sufficiency of room, they would soon wear a healthy appearance. If fine specimens are desired, let every bush or tree stand distinct and free from its neighbour; spread out and peg down all bushes that will admit of it, and prune, support, or remove dead wood, according to their individual requirements. In regulating the clumps, very fine specimens of different shrubs will attract attention, either on account of the symmetry of their form, or the peculiar beauty of their general habit. The best of these should either be exposed to view, or removed and planted in appropriate situations on the lawn, where they will show themselves to the greatest advantage on all sides. While the regulating of the shrubs is being carried on, let any bare spaces left for showy herbaceous plants be forked over. Level turf where necessary, and put the edgings of walks in proper order, as by finishing every part as we proceed, the work is carried on to much greater advantage.

HARDY FRUIT GARDEN.

Few things are more annoying to a gardener, than to see all his Cherry-trees, and his Gooseberry or Currant bushes, cleared of their buds by birds, as would be the case annually in some gardens, if great diligence were not used in destroying the bullfinches as fast as they appear. It is impossible to paint over the branches of tall trees with lime wash, in a similar way to the Gooseberry and Currant bushes; and however cruel it may seem, we can recommend no other remedy than the gun. A single pair of these birds will, in a few days, entirely destroy the buds of a very large tree; this will also show that these enemies cannot be too strictly watched.

KITCHEN GARDEN.

Some early dwarf Peas should now be sown as soon as possible in turf, and raised in heat, to be planted out on a warm border as soon as they are about 3 inches high, and have been gradually hardened. The most economical way of doing this is to cut stripes of turf 4 or 5 inches wide, and lay them on boards with their grassy side downwards; a drill is then to be made along the middle of the turves by pressing a strip of wood into them; and in this the seeds are to be sown, and covered with a little light soil. The boards may be placed under the trellis of a Peach-house, or in a similar situation, where the night temperature does not exceed 50°. The best situation for hardening them is close to a south wall, where they can be sheltered by placing a few Spruce or Yew branches in front of them, until, by gradual exposure, they become thoroughly inured to the open air. The varieties best adapted for this purpose are the Prince Alberts and Bishop's Long-podded, of which a sowing should also be made on an open sunny border. Fairbeard's Champion of England, which is a fine flavoured Pea, and an excellent cropper, may be sown once a fortnight, from this time till the middle of June. Sow also some more Broad Beans. Cardoons, Leeks, and Celery, require checking, as they are commencing to run, in consequence of the mildness of the season. They should be taken carefully up and laid among some light leaf-mould, or old tan, in the shade of a north wall, where they must be well moulded up as a protection in case of severe weather. A piece of rich ground should now be planted with early Cabbage. The distance between the rows should be 18 or 20 inches, and the plants about 9 inches apart in the row, so that every other may be pulled for use first, leaving the rest to become larger. The planting of early Potatoes should be no longer delayed. Light soil, an open situation, and no manure, are the points to be attended to in the cultivation of this very useful, but now fickle, root. The sets should be planted 6 inches deep, and if a few handfuls of burnt clay, or charred refuse, be placed about them, the produce seems to ripen quicker and cleaner, without being deteriorated in quality or size. On a warm border make another sowing of Radishes, and one of Early Horn Carrots. In very favourable localities, Onions, and an early bed of Parsley, may now be sown. The Leek is very hardy, and cannot be sown too early, as its excellency depends upon this, and upon being transplanted as soon as the plants are large enough, into a piece of rich, well-prepared ground.

State of the Weather near London, for the week ending Feb. 6, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

American Blight: *A.* See p. 56 of the current volume.‡

Arums: *A H.* Arum tenuifolium, italicum, and triphyllum will flower out of doors and thrive there, if put at the foot of a south wall in a border dry in winter. Ar. arborescens of Linnæus is from the West Indies; it was called a Caladium by Ventenat, and has since been regarded as a Philodendron.

Books: *C M T.* There is no illustrated work upon the plants of all the tropical parts of the world; nor can there be, when you consider that at least 40,000 plants would have to be illustrated.

Burrs: *Anon.* The substances thus called are the half-vitrified masses found in brick-kilns after they are burnt. They are very hard, and not at all liable to crumble. Large porous dross *may* do, but we never tried it.

Coffee: *A B.* It is a stove plant, and therefore can only be cultivated in England under glass, and in heat.‡

Conifers: *J E.* Juniperus Bedfordiana is a very doubtful plant. It is otherwise called J. Gossainthanea, and is not hardy near London.

Dodecatheon: *A H.* None are much worth growing except the two common kinds mentioned by you. D. integrifolium, in the gardens, is quite inferior. Some of the Pæonies are well known Moutans; but, upon the whole, the list is not worth notice. As for 5*s.* for R. gallica, why its utmost value is 6*d.*

Emigration: *E.* We cannot undertake to point out countries for intending emigrants. It is much too serious a matter. In the absence of other information they must be guided by the books which have been published on the subject.‡

Garden Plans: *A New Beginner.* Study "Loudon's Self Instruction for Young Gardeners," and "James's Gardening," if you can procure it.

Heating: *C F Johns.* One of Mr. Rivers' brick Arnott stoves figured at p. 51, 1846, will perhaps answer your purpose. ‡

Larch: *W B.* You may plant Larch in Ireland at any elevation you please. ‡

Meteorology: *T S P.* You shall have an answer in a post or two.

Names of Plants: *M J.* Polystichum angulare. *S.—Adiantum.* Platyloma flexuosum. *J. Sm.*; Adiantum trapeziforme, *Linn. S. — G H K.* Saurauja villosa — *G C B.* Arbütus not Arbūtus; Gladiōlus not Gladiōlus—*B S.* Acacia biflora. —*G P L.* 1. Phalaris arundinacea; 2. Poa aquatica.

Notice: *C J E.* You cannot give less than a month's notice, unless there is very strong cause for dissatisfaction. A week is however *legally* sufficient under the circumstances.

Orache: *R.* Some of the London seedsmen can no doubt supply you with it.‡

Pine-apples: *A D.* Old turf and leaf-mould will suit them perfectly, provided the turf is light and fibry, and used in a rough state. ‡

Potatoes, &c.: *E N.* We never recommend dealers.

Roses: *Jack.* They have not heat and light enough. That is the reason why they do not expand well, but exhibit the appearance you mention. ‡

Rosewood: *H F.* The tree from which the rosewood of commerce is procured is a species of Trioptolomea, a leguminous genus. See Lindley's "Vegetable Kingdom," p. 548.

Vine at Nettlecombe: *C E.* This subject does not require further discussion.

Yew: *Reader.* Although "few things will flourish under a Yew tree," you need not be at all apprehensive that branches of it used for the spring protection of wall trees will exercise any injurious influence on the forthcoming blossoms. They may, however, have the effect of "drawing" them and thereby rendering them weak if applied too thickly. ‡

Misc.: *W D C.* If your enquiry has not been noticed, it has not been received. If you will kindly repeat it we will give it attention. ‡ — *Z Y X.* You cannot perhaps do better than keep your Morello Cherry tree well syringed during summer with clean water; but to be effectual it should be applied with considerable force. That will keep it clean. ‡ —*F. L.* is not just of a master to insist upon his gardener procuring plants, and at the same time to refuse to defray their expense: such a demand is like desiring the gardener to become either a beggar or a thief. As to the other matters we cannot give an opinion; in fact you express yourself so indistinctly, that we probably do not understand your meaning.

YORKSHIRE AGRICULTURAL SOCIETY.—Prize Sheets of this Society for Stock, Implements, Essays, &c., are now ready, and may be had free on application to M. M. MILBURN, Secretary, Sowerby, Thirsk, Yorkshire.

NEW SKINLESS CHEVALIER BARLEY.—This is far superior to any other Skinless Barley, both in the size of the grain and malting properties. It is also very productive, and altogether the most profitable sort of Barley to cultivate. Messrs. SUTTON intend to send specimens to the Great Exhibition. Samples may be had by post, on application, enclosing two penny stamps. Cash price, 5s. per peck. Quantities, not less than two pecks, will be sent, carriage free, as other Seeds enumerated in Messrs. SUTTON'S Advertisement, at last page of *Gardeners' Chronicle*, of January 25.

Address, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

MANURE DEPOT.
TO FARMERS, AGRICULTURISTS, &c. &c.

G. H. FOLEY, Essex Wharf, Lea Bridge, Middlesex, Agent, by appointment, to the Irish Amelioration Society, for the sale of IRISH PEAT CHARCOAL, an excellent Fertilizer, and when mixed with night-soil or sewage matter renders both inoffensive and retains all their fertilizing properties, and producing, combined, a very valuable Manure, at a remarkably low cost; capable of being conveyed in sacks or otherwise. Price of the Charcoal, in its pure state, 60s. per ton; mixed with Night-soil, 45s. per ton, sacks included.

All needful particulars will be given upon application at the above address.

IRON GATES, HURDLES, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK).

And Highfields Wrought and Cast-Iron Works, Bilston, Staffordshire, Manufacturers of every description of Park Entrance, Carriage and Field Gates, Wickets, &c.;
Plain and Ornamental Fencing and Palisading;
Ox, Cattle, Sheep and other Hurdles;
Tree Guards, Garden Seats, Hay Racks, Wheelbarrows;
Land and Garden Rollers, Stable Fittings, &c. &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and most moderate terms. A great variety of the above articles always kept in Stock at the London Warehouse, and at the Works. Drawings and prices may be obtained on application, or furnished free by post.

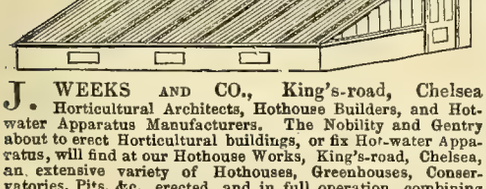
NEW LAPSTONE KIDNEY POTATO.—This Potato is of first-rate quality, and has been highly spoken of by Dr. Lindley in the *Gardeners' Chronicle*, and also by every one that has grown it. It is a most abundant bearer, and the best in quality of any Potato grown, and keeps good up to May or June. They are of good size, and have been grown on warp land near the banks of the Trent, and therefore will be a good change for any other soil.

New Lapstone Kidney Potatoes, in sacks of 2 cwt., at 16s., sacks included.
Prince Regent, ditto, ditto, 10s.
Early Shaws, ditto, ditto, 9s.

Early orders accompanied by remittances will receive prompt attention.

WILLIAM STENT, Nursery and Seedsman, Stockwith, Gainsborough, Lincolnshire.

THE REGISTERED ROSE GIRDLE-LABEL.—A Rose Grower (having found, by long experience, the present method of securing Standard Plants by wires of any kind, and cord or rope of whatever description, to be highly injurious to the bark, and otherwise detrimental to the growth of the plant, besides being clumsy, troublesome, and ineffectual), has the pleasure of submitting to Amateurs and the Public a new Invention which he has recently introduced, for the more efficient and neat fastening of Roses and other Standard Plants to their Stakes.



The REGISTERED ROSE GIRDLE now offered to the Public, besides the advantage of being well adapted for a neat and permanent Label to the plant which it secures, will greatly diminish the time and trouble attending the mode hitherto pursued in the tying of Standard Plants to their stakes. The utility of this invention, while combining two important objects (till now very imperfectly attained), cannot but entitle it, from those who wish a neat and permanent Label as well as an efficient fastener for their Standard Plants, to an additional claim. It is neat as it is efficacious, and as cheap as it is useful.

EXTRACT FROM "FLORIST'S DIRECTORY."—"We consider it one of the most useful articles that have been invented—it forms a permanent Label as well as an unerring fastening, and we shall be disappointed if it is not generally used for Roses and Standard Cytisuses. We shall adopt it for everything we can apply it to in the garden."

Sold, wholesale and retail, by WILLIAM HAMILTON, Seedsman and Florist, 156, Cheapside, London; and to be had of all Nursery and Seedsmen, and may be seen at the Office of this Paper. Price 1s. 6d. per dozen.

DR. S. NEWINGTON'S PATENT DIBBLES, HAND-HOE CULTIVATORS, DRILLS, and other Agricultural Implements for effecting a more scientific system of cultivation, and insuring more abundant crops. Early orders must be given to ensure early execution. An illustrated Catalogue, &c., may be obtained on application to Messrs. DUFAUR and Co., sole manufacturers, 21, Red-lion-square, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.
40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

The Agricultural Gazette.
*SATURDAY, FEBRUARY* 8, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Feb. 12—Agricultural Society of England.
THURSDAY, — 13—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 19—Agricultural Society of England.
THURSDAY, — 20—Agricultural Imp. Soc. of Ireland.

A GOOD deal of angry feeling has lately been excited in Scotland by Mr. PUSEY'S speech at the annual meeting of the London Farmers' Club, and it has, to some extent, found expression in our own columns. The condemnation of Scottish egotism which that speech pronounced—the superiority which it claimed for English farming—the wager on that point which it proposed—all of them, no doubt, in the best natured spirit, before a social meeting of English farmers—have been seriously discussed, and sorely felt in the North. And many critiques have appeared of the unfortunate harangue, to which so wide a publicity has been given. To two of them only shall we refer at present—that of Mr. RUSSELL (Fifeshire), published in a late Number of the *Agricultural Gazette;* and that of Mr. COWIE (Kincardineshire), published in the *Scotsman*, of Jan. 22. The former shifts, we think with justice, all the blame which Mr. PUSEY would attach to *Scottish* egotism—upon the extravagance of *English* praise. We hardly know where to *look* for evidence of Scottish egotism, though we have *heard* enough of it no doubt. With one exception, all the written testimonies of Scottish agricultural superiority that at present occur to us are by English authors, and on them must rest the weight of Mr. PUSEY'S blame. The exception alluded to is the published speech, delivered at an agricultural meeting, on Monday, the 13th of January, by the gentleman already named—Mr. COWIE, of Haulkerton Mains, Kincardineshire. This gentleman draws a picture of English farming from the reports of the *Times* commissioners, and from personal observation, "obtained, not while perched up on a dickey, driving two in hand, but while travelling on foot, with knapsack on back, and working his way through." He finds evidence of English inferiority so soon as he arrives at Carlisle, in the neighbourhood of which "dung is so little valued, that it can frequently be got for nothing." He travels through Devon, Dorset, Sussex, Surrey, Essex, Gloucestershire, Oxford and Suffolk, and he finds in the different districts he visits, "working-people drinking 3 hogsheads of cyder a piece per annum"—"tenants little above the labourers"—"ploughs of the most clumsy make, drawn by six bullocks, all in a line"—"drains filled, not with tiles or stones, but with two feet long stubble, left in harvest, and now cut for the purpose"—"farm buildings formed of wood, and thatched and spread reel-ral over a given surface in the most admired state of confusion and disorder"—"the farmers left almost entirely to provide houses and steadings to themselves." What will the gentlemen of Suffolk say to being spoken of as "the poor, struggling, crazy tenants, of that comparatively rich and accessible county?" Mr. COWIE concludes thus:

"We have not provoked this contest. We are not our own trumpeters. If it so happens that a stranger, previously acquainted with English farming, in passing through Scotland, finds science in combination with practice the rule with us, and the exception among our neighbours—if he here finds threshing-mills as common as roads and bridges, and among *them* as rare as earthquakes and water-kelpies—if he finds us draining and manuring well, and they in general doing neither—and if he chooses to go and publish what he has seen—and if, instead of benefiting by such information (like their leader, Mr. PUSEY), their blood gets up, the spirit of jealousy is roused among them, because they are not our match; the misfortune and fault rest not with us. We have made no invidious comparisons, nor boasted of our superiority; but when assailed (as we have been by Mr. PUSEY and others, and the laurels we have gained attempted to be snatched from our brow) we are not the men to stand silently by and shrink from the combat. We envy what Nature has bestowed in her rich profusion on our neighbours—their good climate—their rich soil; but we wish them joy of what *art* they profess—of their wooden and thatched houses, their 40-feet wide hedgerows, and their stubble drains—and finally, to show our good-will towards them, we hope to see the day when, with the superior natural advantages they possess, they may soon shoot as far ahead of us as they are at present in the rear."

Mr. COWIE may disclaim what he pleases; but our readers will no doubt agree with us in thinking that he *can* blow a pretty good blast with his trumpet, notwithstanding his disclaimer. It is the unfortunate result of the speech which Mr. RUSSELL has criticised that it raises such a spirit as that which Mr. COWIE appears to us to have exhibited. It would be easy to reply in terms similar to those which he has used—to take up the *missed* counties, or even large portions of those which he has blamed, and to point to districts, as large as any in Scotland, where the land is farmed as well, by men as able—and where all this prosperity cannot be attributed to "the number of Scotch bailiffs who have emigrated into England and carried their system with them"—a circumstance which satisfactorily explains to Mr. COWIE whatever exceptions exist, to that general rule of mismanagement, carelessness, and poverty which he asserts English agriculture to present!

But it is very desirable that this contest between Scottish and English agriculture should cease. The terms should altogether drop. Each country contains developed within it many styles of farming, and in each every style exhibits many a grade of quality. The better plan would be to compare contrasted districts, whether in England or Scotland, simply with the desire for instruction, and if there be any noticeable difference in the results which they respectively display, to enquire for the cause in an unprejudiced manner. In this way the results of climate, of soil, of peculiarity of relationship between landlord and tenant, of an educated peasantry, and, if you will, even of national character, may be eliminated with some probability of accuracy. But if under the influence of temper such conclusions are arrived at as Mr. PUSEY suggests—viz., that the excellence of Scottish farming is a merely local phenomenon attributable to extraordinary fertility, or as Mr. COWIE asserts, *namely*, that in England Nature has been extraordinarily kind, and man extraordinarily idle—that the soils of Essex would be a good top-dressing for those of Kincardineshire!—or that descriptions locally true may not be generally false—then the more closely we confine our attention to our own doings, and the less we look on those of our neighbour, the better. This, however, is an absurd determination, for it is possible to look outside our farm, and even to overstep the boundaries of our country, without either jealousy or temper, and to return home again laden with useful information.

We believe that much misconception has hitherto prevailed among many English landowners regarding the universal excellence of Scottish farming: and we believe that a great misconception prevails among Scottish farmers at this day about our English superiority of soil and climate. Mr. PUSEY'S speech represents the reaction of the former extravagance; and a few more such as Mr. COWIE'S, and we should soon have a reaction just as violent of the latter.

## A TRIP TO NORTH DEVON.

(*Concluded from page 74.*)

A crop of Turnips being now grown, how are they to be removed from heavy wet land in a wet climate? (Some idea may be formed of the wetness, when I state that they had scarcely a week's suitable condition for drilling since October, whilst in Essex air drains had not been called upon to act). By using 220 yards of Crosskill's moveable railway, which cost, complete with trucks and turn-tables, 53*l.*, the whole 120 acres were removed by manual labour—advantage being taken of any incline in the ground. Mr. Graburn assured me that a man could move in the truck from 13 to 15 cwt. of roots. The cost of pulling, topping, tailing, and removing to the nearest headlands, is about 6*s.* to 7*s.* per acre. I was gratified to see a large supply in each field well thatched, in various clamps. I believe, about 40 yards is the distance cleared, two each side of the rails. Of course, the railway itself is removed on a long light cart. Suitable occasions are availed of to cart home the roots in dry or frosty weather; or at other times by donkeys and panniers, each one bringing 112 lbs. A number of these useful animals are kept at a trifling expense.

Lord Fortescue's home farm consists of 373 acres, arable, 339 Grass (park, &c.). The live stock consists of 50 cows and heifers in calf, 2 bulls, 300 sheep, 50 pigs, 38 fat cattle, 16 working oxen, 11 three-year-old steers, 52 two-year-old steers, 118 calves. Total 637. The breeding animals partially occupy the old farmery, but new, useful, and extensive buildings have been erected, at a cost of about 3500*l.* The arrangement is simple and economical, the whole being under one slated roof, having a wide span and considerable length. An open-sided barn, or hay and corn shed, is at one end, then comes the steam engine, threshing machine, chaff cutter, cooking apparatus, with a ready access in direct lines to the feeding animals; at the other end is the dung house and urine tank. The roof is span, slated, and the timbers light, owing to the numerous supports it has on the uprights of the various departments.

The bullocks are mostly on boarded floors; no straw is used for litter; a few are in boxes, on Mr. Warnes's plan, but the boards are considered most convenient and economical, setting free the straw for feeding purposes. The floors between the bullocks being of slate, and perfectly smooth, offer a sort of railway facility in feeding, and in removing the solid excrement; the liquid flows in a gutter to its destination.

The whole arrangements of the feeding department appear to me regular and economical. The cut hay, straw, and Turnips are all mixed; the meal, and Linseed, boiled by steam, is poured over and mixed with them, and given to the animals quite warm. The piggeries and external calves' places were not, in my opinion, warm enough, but in all other respects the general body of the building was well lighted, and perfectly ventilated. The steam-engine worked well, without smoke, having only cost 14*s.* for repairs in three years; the only defect being in a pair of vertical mill-stones. I noticed particularly that the draught and flues were well arranged for the economy of fuel and avoidance of smoke. The engine was by David Glasgow, of Birmingham; the chaff-cutter by Ransome; and the Turnip bruiser by Moody. The Turnips were washed and elevated by machinery; the Oats, for food, were threshed daily; the straw was received from the shakers, and passed at once through the chaff-cutters, the chaff being carried up by elevators to its proper deposit. In fact, the interval between each meal was employed in threshing and preparing corn, chaff, and roots, for the succeeding one. The bullocks appeared to be doing well; their hind quarters would have been cleaner, had the openings between the boards been wider. The most interesting objects were 60 fattening sheep, tied up to stakes, in pairs, like bullocks. These occupied the vacant space in the roof, over the bullocks; their excrements following the same direction on an upper floor. I never saw any stock progress faster, being perfectly gentle and tranquil, except when disturbed by strangers. Those at Earl Bathurst's, at Cirencester, are treated much in the same way. Mr. Graburn told me it does not answer so well for lambs as for full-grown sheep. The undisturbed manner in which each animal gets its own share of food, and their perfect quiescence, almost lead me to prefer the tying up to the loose system. But it is still an open question in my mind.

The bullocks consume, daily, about 9 lbs. of hay, 9 lbs. of corn and Linseed, 6 lbs. of straw, 50 lbs. of Turnips, 2 oz. salt, 40 lbs. of water; given warm in three meals. The total of water, including that in the food, would be about 83 lbs a day.—The sheep: 12 lbs. of Turnips, 1½ lb. of Oats, 1 lb. hay chaff. Not cooked—no water. The water in the food about 10 lbs. a day.—Calves eat about one-fifth as much as an ox. The working oxen eat about 30 per cent. more than the fattening oxen.—A barren fattening cow eats in summer 100 lbs of Grass daily.—a milking cow eats 150 lbs. Showing our milk to be a costly affair. There is a singular coincidence between the mode of fattening here, at Mr. M'Culloch's, at Auchness, and at Mr. Warnes's, in Norfolk.

One fact is interesting, viz., that the mixed bullock and other manure, free from straw litter, will neither ferment nor subside. This I have proved practically on my own farm. Mr. Graburn showed me a large accumulated mass, the produce of a twelvemonth, unaltered and undiminished. Its density excludes air, consequently it can neither ferment nor evaporate. It is on this principle that the bullock-pudding under my floors does not give off smell.

The use of straw, as food, is evidently and principally to give bulk and mechanical fitness to richer food, although we must not decide too hastily that it does not contain the carbonaceous elements of fat. On another part of the same farm an old store barn has been cheaply converted into a calf-house, where 80 calves, on boards, tied up to stakes and fed on cooked food, presented all the necessary evidence of progression, with comfort and economy both of food and manure.

To me the most interesting operation was the management of a small off-hand farm of 52 acres. It is an example worthy to be followed, where there are small holdings and limited means. It may be readily imagined that in its primitive state it produced neither much meat nor corn. The fields being enlarged and the land drained, I was most agreeably surprised to find 27 bullocks fattening, tied up on boarded floors, in what had recently been a barn. There was the necessary accompaniment of a copper for cooking, a corn bruiser, a Turnip cutter, a chaff cutter, and a threshing machine! Do not be alarmed, gentle reader; a real threshing machine on a 52 acre poor farm. Well, there it was, a hand threshing-machine by Barrett, Exall, and Co., but his lordship would not suffer such a barbarism as to make a beast or steam engine of mind and matter combined. No—a simple overshot water wheel, supplied from the hill, gave power and velocity to all the machines I have described; and at what cost, think you? about 63*l.* for the whole. I buttoned up my coat and felt resolved that Old England could and should feed her own population; aye, and employ them too. But where is the food for 27 bullocks? All provided, now and *in futuro*. Plenty of Oats, of Turnips, of Tares on the Wheat-stubble, of Clover and of straw, and 4 acres of nice watered meadow available at almost any period of summer. Plenty of manure in the manure-house to grow the next root crops. No guano—bought. Nothing but 2 cwt. of superphosphate of lime, and the home-made manure. Oh! it was a delightful sight, and a beautiful landscape. The abrupt and winding and shaded road, the primitive buildings, standing out in relief from the towering hill that sheltered them, the rushing water and simple wheel, the shaded vale beneath, all carried back the mind's eye to our choicest old landscapes.

But let us leave the enthusiastic for the practical. Here were the elements of compound fertility and reproduction. The produce of the farm is to be beef, pork, and Wheat. Depend upon it if animals do not pay (which I do not admit) they leave us a legacy without which we cannot, as farmers, succeed.

Oh! but says some lynx-eyed critic, where are your horses, Mr. Mechi? Aye, where are the horses? Why, I am happy to say nowhere, on this 52 acre farm; but I saw a pair of new Devon bullocks (capital beef they will make some day) ploughing deep and well—an acre per day. These are the horses—they take their place and food beside the other bullocks. In fact, one of the most pleasing symptoms of my visit was not to find a horse (excepting three or four condemned ones) on his lordship's great farm.

The whole management is simplicity itself. The father ploughs in the morning, the son in the afternoon. The intermediate periods are occupied in threshing Oats, crushing them, cutting Turnips and chaff, and cooking, with the assistance of another man. By simply turning on the water, away goes all the machinery like mad—one fancies there must be a steam engine.

Now, I do say that we must turn our barns into bullock-sheds—fill them with meat instead of corn. The question is settled in my mind. Some years ago Earl Ducie (I was told) writing to a friend said, "I agree with Mr. Mechi in nearly all his principles except his 'great barn.'" Hereafter I shall call it a bullock-house.

Altogether I do say this 52 acre farm of Lord Fortescue's is a most edifying and pleasurable fact, and stands in strange contrast and comparison with others of a similar size. I am hourly more convinced that the salvation of our heavy land farms depends on boarded floors, more stock, and ample drainage.

Passing from this little farm, we examined the tilery on the estate (the first ever erected in Devonshire). The earth makes excellent pipes: the clay is prepared by Clayton's machine, and the pipes passed through Spraggs's. His lordship finds wood-fuel (of which there is an abundance on the estate) and pays 8*s.* 6*d.* for the manufacturing, up to 4 inches in size.

The drying was going on by flues, but the sheds were not considered so advantageous for winter drying, as those kilns now in connection with the heat of the burning kilns at Ainslie's tilery.

We now enter upon Lord Ebrington's farm of 126 acres, on which there were formerly 76 enclosures! now reduced to 12. Here are the same improvements as at his father's, Earl Fortescue's; drainage, root growing, excellent new buildings, and abundance of stock—house fed—in fact, the same elements of increasing fertility: say, 62 fattening oxen on boards and in boxes; 8 working ditto ditto; 2 horses; 64 fattening sheep (tied up); 30 fattening hogs; 2 sows; manure house, liquid tank, &c. Some quiet practical agricultural friends of mine will open their eyes rather wide on comparing the stock with the acres.

The sheep were shorn early, as an experiment: they instantly consumed 2 to 3 lbs. more Turnips per day each, showing that they required a warmer temperature. The pigs appeared to be doing well on Turnips and meal, although I should strongly recommend boarded floors and more warmth for them also.

The Earl of Fortescue's rental is, I believe, about 16*s.* per acre for arable land, and 27*s.* for Grass, tithe included. His lordship appears to me to be meeting the times with a just and liberal spirit. Although he pays 6½ per cent. to the drainage committee for drainage, he only charges his tenantry 5 per cent., and this does not commence till Lady-day twelvemonths after the completion of the work. He is willing to put up water-power and threshing-machines at 6 per cent. from the time of their completion, the tenants keeping them in repair, but being allowed rough timber for the purpose. He is also ready to consider favourably the case of any of his tenants who wish for more extensive and additional machinery.

With regard to grubbing up coppices and useless fences, making drains or water-meadows, or erecting additional buildings, he will give one-half of their reasonable cost, if done by the tenant with his Lordship's approval, within the last seven years; or one quarter, if within the first seven of the term of 14 years. These allowances are made, not in money, but in guano or superphosphate of lime.

His Lordship advances to any of his tenants guano for grain crops, or superphosphate for Turnip crops, without requiring repayment till the Lady-day following, and then only at three-fourths of their cost. The same advantages extend to the purchase of lime.

In conclusion, I have been thus minute in the description of an improving entailed estate on public grounds, as an example to others. I consider the arrangements generally as insuring a greatly-improved condition of the land, the labourer, the tenant, and the proprietor; and, as a necessary consequence to society at large, by diminishing crime and increasing the demand for manufactures. Let me impress respectfully but earnestly on our noble legislators the necessity and justice and advantage of extending the provisions of the Drainage Act to buildings and other necessary permanent improvement. If the individual instance before us is considered proper by the heir to the estate (whom I assume to have concurred in it), and if such provisions are found to work beneficially in a sister kingdom, let them no longer be delayed in England, so that our aristocracy may participate in the honours and advantages of a general national progression.

P.S. The absence of railway communication is a sad drawback to this portion of North Devon. When larger quantities of food are produced by improved farming, it will become an indispensable requisite. I heard there was some good farming in the neighbourhood of Barnstaple, but had not time to visit there. Much farm produce is shipped from Barnstaple to the Welch iron districts, but I heard great complaint of extravagant freights. A good deal of land had been formerly leased for lives, and exhibits the usual evil consequences. The want of root crops and suitable buildings for winter-housing, compels the sale of much stock before winter sets in, although the winters are mild compared with those of our eastern counties.

Lord Fortescue has improved much land by catch and water-meadowing. *J. J. Mechi, Tiptree Hall, Jan.* 27.

## ON SHED-FEEDING SHEEP.

It has occurred to me, during the late wet weather, that the fattening of sheep might be carried on in a much better way than by letting them have their Turnips in the usual manner. At present they are exposed to all weathers, the cutting frost, cold winds, and rain of winter, sometimes in their muddy folds scarce able to move about, much less lie down and rest. Now every one knows that these circumstances are very much opposed to the fattening of the animals, and any plan that could be adopted whereby they might be more quickly got ready for the butcher, a greater number fed on the same quantity of Turnips, and thus a saving of food made, and which at the same time would not be attended with too great an expense, appears to me, and I suppose is admitted by every one, to be very desirable. I know not whether the following remarks will be considered to come within these conditions, but should you deem them worthy a place in your valuable Paper, I shall be most happy to see the criticisms of some of your numerous and able correspondents upon them.

The plan I propose then is this. On the headland, or perhaps along the middle of the Turnips would be better, a space should be cleared sufficiently wide for a moveable shed to be built, which shed is to be large enough to contain, in one long row, side by side, the sheep to be fattened. The shed, I think, would be best made of hurdles, but of course of a different form to those now in use; they should be about 6½ feet high for one side, and 5 feet for the other, and 6 feet in length, this would be the most convenient size for moving about; they could be made of three stoutish upright posts, with a cross piece at bottom, top, and in the middle, the top piece having holes bored in it to fix the roof to; there would require to be some slighter pieces nailed about 4 inches apart, each side of these uprights, and then have straw stuffed tightly between them; this would exclude the air. The roofing could be made of hurdles in the same manner, or, instead of straw, asphalted felt might be used; the whole to be secured against wind by being tied to stakes in the same way as hurdles now are, and the roof would be fixed by pegs fitting in the holes on the top of the side walls. The light might be admitted either from the roof or sides. I do not know what the expense of such hurdles would

amount to, but certainly not much, and once made they would last a long time. The width of the shed should be about 6 feet, and the sheep would stand with their heads towards the higher side, a row of troughs fixed in front of them, and space enough left between the troughs and wall for a man to pass along and feed them; the sheep to be tied up having liberty to stand or lie down.

Suppose, then, 300 sheep in a shed of this kind, I imagine they would require a length of about 650 feet, including a place in the centre for the Turnip house, which might be large enough to contain one day's consumption; in commencing a piece of Turnips (which of course would have to be carted to them), the shed would be first set in the space that has been cleared—at, say, 5 chains from the beginning; and until the sheep had eaten all the food from the ground, both before and behind the house, and 5 chains (or any length you like) at each end, the shed would not require to be moved. The Turnips would be all given cleaned and cut; and where a large number are fed, a small pony or donkey would be a great help in cutting them; a boy to supply the cutter and drive the pony, and a man to carry the cut Turnips, would soon feed the whole. The greatest difficulty would be the manure; but I propose that a thick coat of short straw should be the bedding for the sheep, and about 14 inches of burnt earth put under this, or if peat charcoal could be had it would be better, as it would more likely retain the ammoniacal gases, &c., and then by a little litter being given every day, I think the whole of the droppings would be absorbed, the great object being to prevent any from passing through to the ground, as it would make it too rich. Of course the number of times the shed was moved would depend upon the size of the field, and also upon how far you would choose to cart your Turnips. But suppose we say once a week, and imagine the sheep in their fresh quarters, there would be a long line of manure left behind; this should be thrown up into heaps of a convenient size, and allowed to heat until short enough to cart out on the land, which I recommend to be done by donkeys in small carts that can go about in wet weather without injuring it. Some perhaps will say that the quantity being so small could not be equally distributed over the field, but with care this might be done, and I do not suppose the cost would be very great. Boys could do the whole, only having a good shepherd to keep a sharp look-out and superintend them. At the time the shed was moved these carts would be handy to carry the hurdles, and the sheep might be left until their house was again ready for them. These same donkey carts would also cart the Turnips. If the manure could be made sufficiently short there would be no better plan than to mix it with some dry ashes, and at the time the Barley or Wheat was sown, drill this in with them; the well known drills of the Messrs. Garrett answer for this purpose.

The Turnips for the flock ewes and young ewe hoggets would be eaten off in the common way as, I think, none could be found to answer better. My plan applies only to those sheep intended for the butcher; and if by pursuing this, the animals, from being placed in a warm comfortable house, should fatten quicker, and it is now an unquestioned fact, that heat, to a certain extent, is equivalent to food, I believe we should find ample compensation for the extra trouble and expense involved. I do not overlook the circumstance that some lands require the stamping of the sheep to consolidate them, but it is possible to do this in another way. The main difficulty with which the plan is attended, is to devise some expedient to prevent the sheep-droppings reaching the ground. I do not know at what price peat charcoal could be procured; if cheap, I can think of nothing better, and a little short straw, to keep the beasts comfortable. In cases where the field of Turnips is very large, it would be advisable to parcel it out in divisions; by this means, the food and manure would have a shorter distance to be carted.

Another mode for very flat districts could be used, but, perhaps, this would be too expensive. I only mention it as an instance applicable to the shed-feeding of sheep. The Turnips would have a space cleared across the drills in the middle of the field, as before proposed, and in this space a portable railway is to be laid down; on this railway the trucks or sheds for the sheep would stand; and as soon as all the roots in front and behind, and each end, are consumed, yoke the horses to the carriages, and draw the whole establishment a notch further on; thus the rails would require to be double the length of the sheds, so that they can be taken up when the houses are moved, and placed again in front. It is only on very level farms where it would be possible to follow this plan, and even on these, I presume, it would be found too costly.

That there will be many objections urged against both of these propositions I do not doubt, and shall be glad to see them; if, however, by writing these observations I shall have brought this important subject to a discussion in your columns, so as in the end to arrive at a satisfactory conclusion upon it, my purpose will be gained. Allow me, ere I finish, to add a word or two in behalf of our poor farm labourers. It will be said, granting that the sheep, by adopting this mode, may be more easily and quickly fattened, where is the gain, after paying the greater number of hands required to carry it out? My opinion is, as I said before, there will be enough left for this; and surely it is a pleasure at this time of the year, when work is generally scarce, to see them earning their own bread, and to know that by thus employing them, in many instances the dread, dislike, and restraint of the Union-house is exchanged for the love, enjoyment, and freedom of home. *T. H., Wooddittton, near Newmarket.*

## Home Correspondence.

*Drain Pipes.*—I have read "Fossa's" letter in your last Number, and really hope that it will not have the injurious effect of inducing any one to put stones upon the pipes in drains. When I first began to drain, many years ago, I thought these necessary; but I found out by degrees that beyond, perhaps, making the land dry a few months sooner, they did no good, and it was impossible to tell when they had been used after the second season, except from the inferior quality of the crop, caused by poaching of the land with the carts carrying the stones, of which the evil effects were not removed entirely for three seasons. I quite agree with "Fossa" that economy in outlay is most desirable in all cases, and in none more than in draining; but I think that the true measure of economy is to accomplish a purpose perfectly with the most simple means; and I am quite satisfied that, with proper arrangements, 5*l.* per acre might drain all the land in the kingdom, but certainly not according to "Fossa's" plan; for, by my calculations, such drains as he approves of would cost here at least 10*l.* per acre, which, according to the very useful table he has given, would create a charge of 13*s.* per acre annually. I give my calculation, that "Fossa" may correct me if he can do the work cheaper; but I may perhaps say, as I am anxious to hinder such a mischievous practice as is proposed from gaining any footing, that I speak from a somewhat lengthened experience. I began draining before landlords came forward to lay out their money for tenants, and before Drainage Acts were dreamt of. I had to think whether what I meant to do would help or hinder me to pay my rent—a pretty stiff one—and I had to look to my balance at my banker's for the funds. For many years I laid every main drain and joining with my own hands, and one year I nearly killed a stable of ten horses, and totally destroyed the whole of my carts, in carrying out the very views "Fossa" now promulgates. I mention these facts, not from any wish to disparage scientific men who have devoted their attention to draining, and who have seen its effects under different circumstances. I always learn much from such men, and find that their knowledge is only equalled by their modesty.

—*Agricola Redivivus.*

*Agricultural Improvements.* — Thorough draining is allowed to be one of the first of agricultural improvements, without which, where requisite, all other efforts are unavailing. But there is much difference of opinion as to the means of effecting it; and though there are rules that are generally applicable, they must occasionally be deviated from, on account of local peculiarities. Though a stranger may be well acquainted with the subject generally, he is liable to make great mistakes as to the drainage, management, or value of land, in some places the peculiarities of which he is unacquainted with: of this I have known several notable proofs. These remarks are the result of a judicious letter from "Fossa," in the *Agricultural Gazette* of the 25th of January. The writer is evidently a practical man, well acquainted with his subject, and his remarks are truly worthy of consideration; for though spirited improvement is absolutely required, it must be guided by judgment, without which it will only tend to discouragement and ruin. Though my own experience is decidedly in favour of making under-drains as deep as circumstances allow and require, I have found particular cases in which very shallow ones have answered well; and certainly others in which shallow drains have soon become useless. This has often been the case where landlords have given tiles for their tenants to put in. On looking over a farm where the landlord proposed to do so, I asked the tenant what depth he would cut the drains? His answer was, a foot, or a foot and a half, for as the land was strong, he thought the shallower the tiles were put in the better, if they were only safe from the plough and the horses. My own confident opinion, founded on experience of similar land in the neighbourhood, was that they ought to be double that depth at least, and therefore I advised that no tiles should be entrusted to the deposition of the tenant. I may here observe that the farm, which, if well drained, and in the hands of a liberal and skilful cultivator, was capable of growing fine crops of corn, Clover, and Turnips, was producing but little of either produce or profit, in consequence of the niggardly spare-penny practice of the tenant, who seemed more eager of a reduction in a moderate rent, than of raising the value of the farm above it. Instead of employing labourers to make the most of the land, he was trying to manage, or rather to mismanage it, with as little labour and expense as possible. Though a fine deep loamy soil, it was ploughed shallow, and fallowed nearly every third year; bringing only two light crops in three years, excepting an occasional crop of Clover, Beans, Potatoes, or Turnips on a small portion, and that only of late years. Here, then, it is evident there is much need of agricultural improvement; and I could refer to many other similar cases. I will just mention the case of a somewhat similar but naturally poorer and more unkindly farm. For many years the regular routine had been two poor white corn crops, and then a bare fallow. The tenant and his family were exceedingly industrious and careful, and the rent was very low, yet he was so poor that he could hardly raise it when produce sold well. With much persuasion and considerable difficulty, I got him out of his old prejudices and practices, and induced him to under-drain field by field, as he could manage it, the landlord giving tiles. I also persuaded him to sow some Grass seeds every year, to plough deeper, to drill and hoe Turnips and corn, and to give up sowing two white corn crops together, and occasionally to dibble Beans on wide ridges, and plough and scuffle between them. And now I have great pleasure in hearing that the industrious man is thriving on his farm, low as prices are; for the increase of his produce does much more than make up for the decrease in price. But to return to the subject of drainage. Experience has convinced me that your correspondent is quite right in preferring drains of 3 or 3½ feet, at 20 feet intervals, to 4 feet drains, at 30 feet distance, on some tenacious soils; and on such soils I strongly recommend his plan of putting stones over the pipes or tiles. A field of tenacious clay was drained with tiles, laid 30 or 40 inches deep, and 30 feet apart, and it did well for a few years, but soon required draining over again. That was done by cutting intervening drains, of the same or rather greater depth (for stone drains require to be cut rather deeper than pipe or tile-drains), and filling them with stones, which made the field permanently dry. On other fields of the same kind stone drains of the same depth were found to answer well at 30 feet intervals, though tile-drains did not. On retentive clay the safest and best plan is to place a pipe at the bottom, cover it with a sod Grass side downwards, and then put in small stones, covering them also with a sod; this plan makes a safe, effectual, and permanent cure. I know also that there is some strong land where very small pipes, laid deep and at wide intervals, are perfectly efficacious; but that land, though strong, is of a more porous nature. Prejudice and ignorance often prevent the untravelled farmer from seeing the practicability of such improvements as are evident to a stranger; and yet that stranger, though he may suggest some valuable alterations, may in some respects be more incompetent to judge than the less informed local inhabitant: hence it is needful that they should consult together. It is not enough merely to subdue an enemy: we ought to endeavour to convert him into a friend. Stagnant water on or in the soil is very injurious, but that water is capable of being turned to many valuable purposes; and it behoves us in these difficult times to make the most of every drop of water, every particle of manure, and every yard of land. It is possible that water may be profitably retained in large reservoirs, and raised at will by machinery, so as to become exceedingly valuable in irrigation, both of Grass and tillage land, and in its application as a motive power by which various operations may be performed. P.S. If I were a landlord, I would give liberal assistance to the tenant in the improvement of the farm and its cultivation, rather than make a small abatement of rent. *O. F.*

*West of Scotland Dairy District.* — In your *Gazette* of the 25th ult., headed "Dairy Management," and signed "A Subscriber," it is stated that the practice of feeding milk cows is by giving them each about 25 lbs. of boiled Turnips, and 6 lbs. of cut straw, and 3 lbs. of Bean or Pea meal per day. The expression is, "this constitutes their daily diet, and I got from each cow 6½ lbs. of butter." Now, does this mean *per day?* [No! No!] It is of importance to know this, as in the dairy country here we never heard of such a produce; it is enormous. *Subscriber.* [We hope our correspondent alluded to will state the particulars of his case more fully, specifying particularly any circumstances which may tend to place his experience beyond the ordinary average of his district.]

*Poultry.*—As many of your readers are like myself, probably, poultry fanciers, the experience of one who has paid considerable attention to their habits, &c., may not be uninteresting. I commenced first with the common barn-door fowl; but found that, although I obtained a fair quantity of eggs, yet when I allowed them to hatch, they were so long with their chickens that the season was pretty well past before they commenced laying again, and that the chickens were very long before they arrived at an edible size. My next trial was with Poland pullets, and a Cochin China cock, and two pullets of the same breed; the expense of these last was high, but I found their superiority very shortly, and although I never obtained two eggs in one day, as has been stated, yet the number of eggs laid by them was most extraordinary—certainly, three times as many as I obtained in proportion from the Polands; and another advantage is, that when allowed to sit, they only remain with the chickens about three weeks or a month before they begin to lay afresh. I was so pleased with them that I have cleared my yard of all but the Cochin Chinas (with the exception of one old patriarchal hen, that I have had for some years, and am rather attached to), and have now as handsome an assortment of Cochin Chinas as I believe are anywhere to be met with. One of the cock birds, which I disposed of to a friend, weighed, when five months old, between seven and eight pounds, and this without being cooped, just as taken from the yard, which is gravelled, and kept perfectly clean, as well as the hen-house; the birds have also a long private roadway, at one end of which there is plenty of cinder ashes and a Grass plat. I have also a large open shed for them when the weather is unfavourable; by this means the hen-house is kept pure,

as it is only used for laying and roosting at night; they they are fed on Barley, Oats, and off-corn, mixed, as much as they can eat twice a day, with occasionally a little Pollard and Cayenne pepper, which they eat greedily, with now and then a Cabbage, Potatoes, and Carrots, to vary the food. The eggs are of a brownish flesh colour, with minute specks of white, and most delicious eating; and even at this season of the year my hens are laying from five to six eggs a week each, and I expect all my pullets to begin laying in a few days. I was very particular in the selection of my stock, which is very necessary, now more particularly; the parents of my birds were from those at Windsor, and I have every reason to believe perfectly pure. I forgot to say that I crossed a few last year with the common hen for the table, and found the progeny were, if anything, larger than the true kind; this, I believe, is usually the case. I feel much pleasure in reading the remarks made in your paper on poultry, and am glad to see that the subject is receiving more attention than it was wont to have. Why should not the London Show, in Baker-street, add poultry to their exhibition, as is done in the Midland districts? It certainly would be much more interesting to the lady visitors than the mountains of obesity usually displayed there. *Henry Copland, Chelmsford.*

*The Blight of Wheat.*—The Oxford Farmers' Club has been discussing the origin or cause of this disease; some of its members attribute it to hedge-rows, want of draining, and to a proper cultivation of the soil. The writer of this cannot, from past experience, attribute it to any of these causes. Sometimes very forward crops of Wheat are attacked; and, again, very backward crops are equally liable to this disease. Land that has received a good coating of manure has suffered much from this disease, whereas the other half of the field that received no dressing of dung, was strong, luxuriant, and yielded 10 sacks an acre. The yield of the blighted portion was between 5 and 6 sacks per acre. The autumn of 1850 was the period the Wheat crop suffered more than any farmer in these parts ever remembered. Fields of Wheat, in a forward state of growth, and somewhat thickly sown, were almost annihilated, as was the case of the Wheat crops around Reading, in Berkshire. Early sown Barley crops suffered at the same time, and the attack of this disease was distinguished by the redness of the straw; that redness was attributed by strangers as being a different variety of Barley! I saw this last-mentioned crop at harvest, and upon examining the ears I found the leading stem had been stunted or arrested in its growth, and the ear had ripened almost in the sheath. The sample of Barley was not bad, but the grain was not so plump as it otherwise would have been. These crops all suffered from a westerly and south-westerly gale—and during the last 3 or 4 years those winds have done much harm both to Bean crops and Potatoes. How is it the blight attacks Vines, encrusting the Grapes with a sort of scab? It is said to be a new disease within the last two years. *X. Y. Z., Hants.*

*The Present Condition of Irish Agriculture.*—Perhaps the unprejudiced reflections of an Irish subscriber on this subject, and the means employed for its elevation, may not be unacceptable to your readers. Ireland, as she is, presents a sad picture of rural and social disorganisation. Many causes have been set forth to account for the physical decrepitude of the nation, and no matter how opinions may clash, the main cause must be traced to the defective agriculture of the country. This defective system of cultivation has been encouraged by two principal causes. 1. The apathy of landholders as to the improvement of their tenantry. 2. To the absence of an industrial education among the agricultural population. Landlords have studiously neglected the improvement of their tenants, they have kept too great a distance from them, they have disregarded their wants, requiring only their rent; no matter how that rent was made up, whether it was wrung from the honest savings of industry, or drawn from the expiring fertility of their farms. To meet a heavy rent, the chief object of the farmer was to take as much out of the soil as possible, with a total disregard to every principle, either for maintaining the soil's present productiveness, or adding to its permanent fertility. Decaying industry thus led to habits of imperfect cultivation, which, by repeated practice, settled down into fixed principles. The culture of the Potato, affording a large return for very little expended labour, was quite in accordance with the farmer's inclination—plenty to eat, and nothing to do. The people having thus the means of procuring plenty of food at a trifling cost, marriages were encouraged, population increased—a demand for land ensued, and the landlord, following the law of selling, let out his land to the highest bidder, neither considering the character of the purchaser, nor even giving a thought as to the permanent improvement of the land. Why should he? since as long as Potatoes were to be grown, he felt satisfied land would be required to produce them; for in those days no one even dreamt of the Potato disease. But there was an infinitely worse disease which affected both landlord and tenant, which slowly preyed upon their vital interests. The landlord's income annually prospered by the annual increase of a people for food, or what was the same, a demand for land to produce it. The consequence was, holdings were subdivided and parcelled out, and the cursed conacre system ensued. Land rose to treble, aye, quadruple its value, landlords intoxicated with their ill-amassed wealth became profligate, middle-men aspiring to hopes beyond their reach became extravagant; agents accumulated fortunes by squeezing out the last penny from the wretched profits of an infatuated people, and "drivers" were employed to snatch from the ebbing industry of the nation the only remains of a wrecked prosperity. Could the small farmer prosper under the evil lynx eye of an agent, who but watched for the smallest outward mark of improvement on his farm or person, as a pretext to raise his rent; or, perhaps, bribed by a selfish neighbour, coupled with the offer of a higher rental, to eject him? Were these not sufficient causes to induce a partial, faithless, and ungenerous agent to dislodge, perhaps, a thriving tenant? A heavy purse and a swelled rent-roll were agreeable to both agent and landlord. The farmer, to prevent himself from being suspected as well-doing, had to resort to the meanest subterfuges to counteract the too evident designs of an unscrupulous agent. This led to the practising of that low cunning which is peculiarly characteristic of the lower Irish. They have been thus forced by circumstances to overlook the duties of outward decency, to deny themselves those domestic little comforts which exhilarate the blessings of life, and to dwell in the most miserable abodes, at which feeling humanity must shudder, as the only safeguards from rack-rent and eviction. Where was improvement to spring from such an anomalous position of society? Was not the road to progress, here, the road to ruin? And let a consideration of these things mitigate our censure upon an unfortunate people, whose industry was checked, whose energy destroyed by the oppressive workings of a system. Thus things went on—the cultivation of the land was in an inverse ratio to the fertility of soil, until the Potato, the sole esculent of millions, was destroyed, and the hopes of thousands blasted, fortunes shattered, enterprises wrecked, and the grave prematurely opened to receive its early victims The income of proprietors being checked in its flow to their coffers, we can now imagine the bitterness they feel in the possession of a diminished income. They can no more settle princely dowers upon their daughters, or bring up their sons as idle "'squireens" to ride roughshod over the honest industry of a tenantry. Rich and poor must follow the law of subsidence in their fortunes, and the former may, in the retirement of an inferior, but perhaps not the less happy home, find room for calm reflection. Not by building sanguine hopes on the "baseless fabric" of renewed protection, which, alas, to many, is yet the nightmare of their thoughts; but in the hope that better men will fill their much neglected office, who will, by studying the improvement of their Irish tenantry, raise Irishmen to the enjoyment of every physical, moral, and social happiness, and treating them as rational men, not mere serfs, nor yet mere machines; but as individuals, in whose proper management the interests of the landlord and happiness of the tenant are inseparably bound. *Libra, Jan.* 29.

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover Square, on Wednesday last, the 5th of February; present, His Grace the Duke of Richmond, K. G., President, in the chair; Lord Camoys, Lord Southampton, Lord Feversham, Lord Ashburton, Lord Portman, Hon. Robert Henry Clive, M. P., Hon. Dudley Pelham, M. P., Hon. Henry William Wilson, Sir Thomas Dyke Acland, Bart., M. P., Sir Robert Price, Bart., M.P., Colonel Austen, Mr. Raymond Barker, Mr. Barnet, Mr. S. Bennett, Mr. Bramston, M. P., Mr. Brandreth, Mr. Burke, Colonel Challoner, Mr. Evelyn Denison, M. P., Mr. Druce, Mr. Foley, M. P., Mr. Garrett, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Hudson (Castleacre), Mr. Jonas, Mr. Kinder, Mr. Miles, M. P. (Leigh Court), Mr. Milward, Mr. Pusey, M. P., Prof. Sewell, Mr. Shaw (London), Mr. Shaw (Northampton), Mr. Villiers Shelley, Prof. Simonds, Mr. Slaney, M. P., Mr. Stanfield, M. P., Mr. Thompson (Moat Hall), Mr. C. Hampden Turner, Mr. Villebois, Prof. Way, Mr. Jonas Webb, and Mr. Wilson (Stowlangtoft).

Zachary Daniel Hunt, Esq., of the Old Bank, Aylesbury, and William Augustus Commerell, Esq., of Strood Park, Sussex, were elected Governors of the Society. The following new members were elected:—

Gow, James, Fowler's Park, Hawkhurst, Kent.
Hale, John, Fellcourt, East Grinstead, Sussex.
Gosselin, Martin Hadsby, Ware Priory, Herts.
Pelly, John Henry, Oak Hill, East Barnet, Herts.

The names of 53 candidates for election at the next meeting were then read.

Sir. Francis Lawley.—The Council received with a deep feeling of regret the announcement of the death of Sir Francis Lawley, Bart., of Middleton Hall, Staffordshire, one of the members of the Council in the class of Trustees, and an original Life-Governor of the Society, who, preferring the hereditary rank of his ancient family, as one of the oldest baronets of the United Kingdom, to the honours of the peerage, which were offered for his acceptance, devoted his time and means to the happiness of all around him. He was indeed, in the highest sense, a truly English country gentlemen, whose name and memory will be long cherished with affection by the wide circle of his friends, and the results of whose benevolent consideration will be long felt by the tenantry on his estates, who were more immediately within the sphere of his influence, and by the "poor and needy" of every class, to whom he ever proved so great a blessing.

Finances.—The current cash balance in the hands of, the bankers on the last day of the month just ended, was found to be 2177*l.*

Nomination of Judges.—Lord Portman, as Chairman of the Judges' Committee, presented to the Council the following report, which was unanimously adopted:—

The Committee beg to recommend to the Council the adoption of the following course, to be pursued in future for the nomination and selection of the Judges of Implements and of Stock at the Country Meetings of the Society,—namely,—

1. That prior to the Monthly Meeting of the Council in May, the Secretary shall write to each of the Judges who have acted in the three preceding years, asking whether he is willing to allow himself to be again put in nomination; and, if so, for what description of stock or class of implements he would be ready to act, if he should be appointed by the Council.

2. That the members of the Society will materially aid the Council, if they will exercise their privilege of forwarding to the Secretary, before the 1st of May in each year, the names of such parties, willing to act, as they would recommend to fill the office of Judge, stating the particular kind of implements or description of stock for which their experience would render their services most likely to be useful to the Society.

3. That the Secretary, immediately after the 1st of May, should form a schedule of the names of persons so obtained, and supply each member of the committee of selection with a copy thereof as soon as possible after their appointment.

4. That the Committee, or Committees, appointed by the Council in May, for the selection and recommendation of fit persons to be appointed Judges at the ensuing Country Meeting of the Society, should consist of not less than 10 members each, of which the quorum for business should be five. (Signed) Portman, Chairman.

Veterinary Science.—Lord Portman, having laid before the Council the following Report, which was unanimously adopted, gave notice, that, at the next Monthly Council, he should move the annual grant of 200*l.* should be made to the Royal Veterinary College, as proposed by the Committee:—

The Committee, appointed to confer with a Deputation from the Royal Veterinary College, beg to report to the Council the result of that Conference: namely—

1. That, on July 10th, 1839, the Royal Agricultural Society of England made a communication to the Royal Veterinary College, inviting their co-operation, and requesting them to turn their attention to the diseases of cattle, sheep, and pigs; and they voted to the College the sum of 200*l.* per annum, as a contribution towards the additional expenses to which the Royal Veterinary College would be subjected.

2. That the Royal Veterinary College readily responded to this appeal, and expended a considerable sum of money in building sheds, &c.; and appointed a professor to attend to this department, at a cost to the Royal Veterinary College of about 400*l.* a-year.

3. That since that time the pupils in the College have received instruction in these branches, namely, in the pathology of cattle, sheep, and pigs; and a body of young men, thus instructed, have been spread over the country.

4. That the Royal Veterinary College, during the suspension of the grant, have continued for the last two years the same course of instruction, and the same expenditure, and in addition have paid to Professor Simonds 50*l.* for lectures given to the Royal Agricultural Society of England.

5. That the Committee, after a full consideration of the question, are unanimously of opinion, that the best mode of expending the sum of 200*l.* per annum, devoted by the Council of the Royal Agricultural Society of England to the improvement of Veterinary Science, is, to renew the annual grant to the Royal Veterinary College.

6. The Committee propose, however, that the renewal of the grant should be accompanied by the following conditions: namely—

(1.) That the Royal Veterinary College make a report annually of their proceedings in these particulars to the Royal Agricultural Society of England.

(2.) That the Royal Veterinary College admit to the Members of the Royal Agricultural Society of England, the privilege of sending to the Royal Veterinary College, Cattle, Sheep, and Pigs, on the same terms as if they were subscribers to the Royal Veterinary College.

(Signed) Portman, Chairman.

Show of 1851.—Lord Portman then laid before the Council the Report of the General London Committee, along with the "conditions" transmitted to him by Lord Seymour, her Majesty's Chief Commissioner of Woods and Forests, and a Letter from Lord John Russell, First Lord of her Majesty's Treasury, communicating to Lord Portman his own views, as well as those of the Duke of Wellington, Commander-in-Chief and the Ranger of Hyde Park, in reference to the show of live stock which the Society had been invited to hold in Hyde Park during the present year. This Report, which, on the motion of Lord Feversham, seconded by Mr. Miles, M.P., was unanimously adopted by the Council, recommended in the most decisive terms, that the Council, acting on the part of the Royal Agricultural Society of England, should not consent to the "conditions" proposed for their acceptance by the Office of Woods and Forests; but, on the contrary, that they should request the Duke of Richmond, as their President, to wait upon Lord John Russell, agreeably with his lordship's expressed willingness to promote the objects of the Society, and confer with him on the site most suitable for the purposes of the Society's Show of Stock, in order that her Majesty's pleasure may be taken on the subject.

The Duke of Richmond intimated his intention to take the earliest opportunity, consistent with the convenience of members, to hold a special Council for further decision on this important subject; to which occasion, also, it would be desirable to refer the conditions and regulations of the Society's Prize Show for 1851.

Flax-Cotton.—Mr. Pusey, M.P., gave notice that M. Claussen would attend at the Weekly Council on Wednesday next, for the purpose of showing specimens of the new mode of preparing flax for its conversion into flax-cotton; and of giving to the members some account of the process.

Exeter Meeting.—Mr. Spreat, of Exeter, presented to the Council a first-class coloured print of his View of the Fore-street in that City, on the occasion of the Society's Country Meeting in 1850, and of the decorations of the city on the occasion; dedicated, by special permission, to Her Most Gracious Majesty the Queen; for which, and other presents made to the Society, the Council ordered their best thanks to be communicated.

## Miscellaneous.

*Prices Current of Manures.*—These prices vary in some instances according to the quantity of manure taken,

| | 10 p.m. | 29.47 | ... | little snow at 8 p.m.; calm and overcast. |

* On Friday, 24th p.m., I watched the dense masses of this storm gathering in the SW., as though it lay beyond Ushant, and over the Bay of Biscay (at which time it probably blew hard at W. off Lisbon). All the 25th I travelled to the NNE. in advance of it, the rain commencing as I halted from time to time, and ceasing as I resumed my drive. It crossed the S. of England, and went away to NE.

† This storm came from the westward, and I travelled parallel with it, on the Great Western Railway, from Chippenham to London, between noon and 3 p.m. of the 28th, having a bright sunny day, with very heavy clouds, about 20° of the southern horizon. Shortly after our arrival at Paddington, the rain overtook us; and during that evening it rained heavily at Woolwich.

‡ This storm came from the westward. I think that this, and also the last, must have gone eastward; but I regret that from accidental circumstances I was prevented from observing the weather during their passage.

§ This storm came from N. of W., producing intense cold in London on the 30th, with a westerly wind, an unusual circumstance, easily explained by its having its left hemisphere in a colder latitude. As this storm travelled over the centre of Ireland and England in a course nearly due east (*i. e.* parallel to the equator), and moving slowly, it produced on the storm of the succeeding days (which travelled rapidly from the SW.), the unusual effect of causing it to recurve to the E. and SE.

‖ A very extensive storm, of which the central storm's-eye must have been passing very slowly over the south of England during the afternoon of the 31st, travelling a little south of east, probably up the Channel, and passing over Frankfort on the 2d and 3d of February. With very little wind, and only one heavy shower of rain of 10 minutes' duration, soon after noon on the 31st, my barometer remained at 29.09 from 8 a.m. until 4 p.m., and only fluctuated .02 between that hour and 10 p.m. The back draught of this storm brought heavy fogs and frost over London on the night of the 2d Feb. From the warmth of the weather during its passage, and rapid fall of the barometer previous to its arrival, I suppose it to have come from the S. or SW., and having run against the southern limb of the preceding storm, to have been deflected by it from its proper course; an interesting instance, should this anticipation be verified, of storms meeting from different parts of the North Atlantic Ocean.

Dorchester, Feb. 5th. *F. P. B. M.*

(*To be continued.*)

* I am ignorant of the nature of one or two of these substances.

## Notices to Correspondents.

Bituminous Shale as Manure: *W B H.* Have any of our readers tried the "Shale" manure for heavy lands? We should be glad to know their experience.

Cabbages: *W D C.* A. Pontey, Plymouth, tells us that he has Drumhead Cabbage of a variety that will keep hard and good all March and April, and sometimes later. This Cabbage is impregnated with the Red Cabbage of the Dutch, and should be sown in August and transplanted in beds, and finally planted out early in May. "This Cabbage frequently grows from 60 to 80 lbs. weight."

Cream: *Y Z.* You must allow the milk to run off more slowly than you have been accustomed to do. One hole for a large surface is not able to draw it off well.

Fences: *Yorkshire.* Your workman is wrong. If your hedge is in a situation where stock are not likely to break through it, the thinner (in reason) you plant in the twigs the better, from "4 to 6 inches apart," will be suitable interstices to leave between the thorns. The old stools by the side of the hedge should be grubbed up, and your fence made to occupy the least possible space. See article "Fences" in the "Cyclopedia of Agriculture."

Gorse and Hemp: The Editor of this Journal would be glad to meet any one acquainted with the cultivation of either of these crops.

Grass Land: *V R.* You will find your question was answered last week.

Grubber: *Mr. Rous* will obtain all the information he requires by applying to the maker, Mr. Scoular, Haddington.

Hydatids in Sheep: *Mutton.* Decidedly insectivorous. If the hydatid be carefully dissected and placed in water, its alternate contractions and expansions may be readily distinguished. Breeding in and in has with much reason been considered in the human subject to be productive of cranial diseases. The writer doubts the truth of the analogy when applied to animals, particularly in such diseases as may be referred to "*omne ex ovo.*" See Youatt on the Sheep, also Spooner on the same subject. *W. C. S.*

Limestone: *Farmer.* Limestone may be converted into gypsum by the addition of sulphuric acid; but as the acid alone for such a purpose would make the gypsum so made cost 6*l.* or 7*l.* a ton, this process is not likely to be used. Gypsum occurs naturally in the marls of the new red sandstone; and that is the place where it is obtained for agricultural purposes.

Oats: *M T H.* The error was doubtless typographical, and 1200 feet were intended.

Potatoes: *E Johnston.* We think the application of guano *would* make the crop more liable to disease. At the same time we would, in our own locality, where an immediate sale of the produce is possible, rather have a luxuriant crop somewhat diseased, than a scanty crop though healthy.

Saw-mill: *G B P.* We are informed that 2-horse power will drive an 18-inch saw.

Self-shutting Latch: *L S G.* You must depend either upon the spring or the weight of the latch for its operation. The following is perhaps one as good as any:—A projecting horizontal bed with a notch in it is presented by the post to which the gate shuts, and over this the tongue of the latch projects as it swings to and fro. This tongue is placed horizontally, and is weighty enough to support an upright shaft from its further end, which passes through the upper bar of the gate; and by pressing which down it is lifted out of the notch by which, when it is at rest, it holds the gate in its place.

Stable Manure: *J L B.* Spread it every morning over the accumulating heap; it is best to mix it in this way with all the other descriptions of dung on one square bed, allowing that to rise 3 feet or so before covering it with earth, and then commencing another.

## Markets.

COVENT GARDEN, Feb. 8.

Hothouse Grapes and Pine-apples are still somewhat dear, and the supply of good dessert Pears is limited. English Apples are scarce, but foreign ones are sufficient for the demand. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Forced Vegetables of all kinds are abundant and good except French Beans, which are scarce. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. per pottle. Cucumbers, though good, meet with an unusually dull sale. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Cinerarias, Chrysanthemums, Roses, and the different kinds of spring bulbs.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6s to 8s | Lemons, per doz., 1s to 2s |

POTATOES.—Southwark, Feb. 4.

The Committee report that though the arrivals last week have been low from Scotland, we have had quite enough from Yorkshire, the Continent, and by rail for the wants of the trade, which have been so limited that it is with difficulty the following prices have been realised:—York Regents, per ton, 80s. to 100s.; Scotch do., 65s. to 80s.; ditto Cups, 55s. to 65s.; Cambridgeshire and Lincolnshire Regents, 70s. to 85s.; French whites, 50s. to 65s.

COAL MARKET.—Friday, Feb. 7.

Hollywell, 13s. 9d.; Eden Main, 14s.; Tanfield Moor, 12s. 6d.; Wallsend Haswell, 15s. 3d.; Wallsend Stewarts, 15s. 3d.; Wallsend Tees, 15s. 3d.—Ships at market, 200.

HOPS.—Friday, Feb. 7.

Messrs. Pattenden and Smith report that there is a good demand for middling and fine Hops, at better prices. Mid. and East Kents, 70s. to 120s.; Weald of Kents, 63s. to 90s.; Sussex, 59s. to 80s.; Yearlings and old Hops, 20s. to 40s.

SMITHFIELD, Monday, Feb. 3.

The supply of Beasts is moderate: however trade is exceedingly dull, and although 3s. 8d. is quoted for a choice article, it is an extreme price. The number of Sheep is small; enough, however, for the demand. Prices are about the same as on Monday last. Trade is dull for Calves at Friday's quotations. From Holland and Germany there are 519 Beasts, 1380 Sheep, and 137 Calves; from Norfolk and Suffolk, 2000 Beasts; from Scotland, 400; and 600 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. ... | 3 | 6 | to 3 | 8 | Best Long-wools . | 3 | 6 | to 3 | 10 |
| Best Short-horns | 3 | 2 | — 3 | 4 | Ditto Shorn ... | | ... | | |
| 2d quality Beasts | 2 | 8 | — 3 | 0 | Ewes & 2d quality | 3 | 0 | — 3 | 4 |
| Best Downs and | | | | | Ditto Shorn ... | | ... | | |
| Half-breds ... | 4 | 0 | — 4 | 4 | Lambs ... ... | | ... | | |
| Ditto Shorn ... | | ... | | | Calves ... ... | 3 | 4 | — 4 | 4 |
| | | | | | Pigs ... ... | 2 | 4 | — 3 | 4 |

Beasts, 3892; Sheep and Lambs, 19,100; Calves, 193; Pigs, 295.

Friday, Feb. 7.

The number of Sheep is small and the demand still less; prices are on the average lower than Monday, and several remain unsold. There are rather more Sheep than on Friday last; trade is very dull, and late rates with difficulty obtained. We have a few shorn Sheep from Gloucester, and also a few forward Lambs from the home counties; but it being early in the season for these things, there is but little demand for them, and they make low prices. Calf trade is no better. Foreign supply consists of 39 Beasts, 280 Sheep, and 172 Calves; from Norfolk and Suffolk, 250 Beasts; from Scotland, 40; and 75 milch cows from the home counties.

| Best Scots, Herefords, &c. ... | 3 | 4 | to 3 | 6 | Best Long-wools . | 3 | 6 | to 3 | 10 |
|---|---|---|---|---|---|---|---|---|---|
| Best Short-horns | 3 | 0 | — 3 | 4 | Ditto Shorn ... | | ... | | |

| Half-breds ... | 4 | 0 | — 4 | 4 | Lambs ... ... | | ... | | |
| Ditto Shorn ... | | ... | | | Calves ... ... | 3 | 4 | — 4 | 4 |
| | | | | | Pigs ... ... | 2 | 4 | — 3 | 4 |

Beasts, 601; Sheep and Lambs, 3670 · Calves, 244; Pigs, 230.

MARK LANE.

Monday, Feb. 3.—Although the supply of English Wheat to this morning's market was small, best qualities barely obtained late prices, and inferior must be written 1s. per qr. cheaper. The demand for foreign was very limited, and in retail, the finest nearly realising late quotations. English Barley, excepting picked samples for malting, is very difficult of disposal, and the turn lower.—Beans, Peas, and Oats are each rather lower in value.—Flour is nominally the same as last week.

Friday, Feb. 7.—The arrivals of grain either English or foreign have been small this week. To-day's market was but moderately attended, and little business transacted. The value of Wheat, Peas, Beans, and Oats is nominally the same as on Monday, but Barley can only be disposed of at a slight reduction.—In Flour there is no alteration.

Liverpool, Tuesday, Feb. 4.—Excepting a fair quantity of Oatmeal from Ireland, the arrivals of grain, &c., thence and coastwise this week are small. The supplies from abroad are less than of late, and embrace 13,171 barrels of Flour, and 2080 quarters of Indian Corn from the United States; and 8641 sacks of Flour and 3000 quarters of Wheat from France. The exports are again large to Ireland and ports on our coast, and this week comprise 3097 quarters of Wheat, 2496 barrels and 332 sacks of Flour, 4788 quarters of Indian Corn, and 190 barrels of Indian meal. The business transacted has been limited, and the tendency has been towards lower rates. At this morning's market sales of Wheat and Flour proceeded slowly, at a decline on the former of 1d., and in some instances 2d. per bushel on the price of last Tuesday, and also 6d. per sack and barrel on Flour. Indian Corn was 6d. per qr. lower, and the demand not so good as of late. Oats, Barley, Beans, and Peas were each alike neglected, and the quotations are unvaried.—Trade the last two days has been inactive, and prices nominally the same. The corn market this morning was dull generally. Wheat and Flour barely supported the rates of last Tuesday. Indian Corn was also easier to purchase, and a parcel of fine American flat yellow did not exceed 31s. per 480 lbs. Oats, Barley, Beans, and Peas were each unchanged in value.

THE APPROACHING COLD WEATHER.

THERMOMETERS FOR REGISTERING THE EXTREMES OF HEAT AND COLD, of the best construction, 1*l.* 1*s.* and 1*8s.*; of the common construction, 15*s.*, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.* Night Thermometers for Registering Cold only, 10*s.*, 7*s.* 6*d.*, 5*s.*, to 2*s.* 6*d.* Thermometers for Baths or Brewing, 12*s.* 6*d.*, 10*s.*, 7*s* 6*d.*, to 2*s.* 6*d.* Hotbed Thermometers to 4 feet long, 25*s.*, 20*s.*, 17*s.* 6*d.* Steam pressure Gauges, 2*l.* 5*s.* and 2*l.* 2*s.* Rain Gauges, from 10*s.* Lactometers for showing the Quality of Milk, with instructions for use, 15*s.*, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.*, 5*s.* Hydrometers, for trying Sulphuric Acid, 10*s.*, 7*s.* 6*d.*, 5*s.* Barometers, Microscopes, Telescopes, Drawing Instruments, &c.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 90, Hatton-garden, London.

SILVER SAND, PEAT, &c.—REDUCTION OF PRICE.

EDWARD KEMP begs to return his grateful acknowledgments to his Friends and Patrons for favours hitherto received, and informs them that he has made considerable reduction in the price of Silver Sand, which he trusts will ensure a continuance of their support. Particulars will be forwarded on application addressed EDWARD KEMP, 16, Ann's-place, East-street, Old Kent-road, London.

N.B. No connection with any other paty.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes.

6 by 4 ins., 6 by 4½ ins., 6½ by 4 ins., 6 by 5¼ ins., 6½ by 5 ins., 12*s.* each.

6½ by 5½ ins., 6 by 6 ins., 6½ by 6 ins., and under 8 by 6 ins., 13*s.* each.

9 by 7 ins., 9½ by 7½ ins., and 10 by 8 ins., 15*s.* each.

Large sizes, 16 oz., 2*d.* and 2½*d.* per foot.

Large sheets, in 200 and 300 feet cases, 2¼*d.* to 2¾*d.* per foot.

16*s.* per box; or 2¾*d.* per foot if less than one box be taken:

| | | | |
|---|---|---|---|
| 11 inches by 8 inches | | 13 inches by 9 inches | |
| 12 ,, by 8 | ,, | 12 ,, by 10 | ,, |
| 12 ,, by 9 | ,, | 14 ,, by 10 | ,, |

Boxes charged 1*s.* each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

GLASS SHADES FOR ORNAMENTS.—Our price is 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the quality of Milk: four tubes in frame, 6*s.* each. Wasp Traps, 3*s.* per dozen. Stands for Pianofortes, 9*d.* each.

MILK PANS 2*s.* to 6*s.* each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Pastry Slabs; Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

N.B. The moderate charge of 1*s.* for each packing case will be made, which we think will be an inducement for parties to retain them; but if sent back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

REGISTERED ROLLER MILL for Crushing Linseed, Oats, Malt, Barley, &c., and Breaking Beans and Peas. Manufactured by E. R. TURNER AND CO., late HURWOOD and TURNER, St. Peter's Foundry, Ipswich.

E. R. TURNER and Co. claim for their registered Roller Mill the particular attention of Agriculturists, Housekeepers, and others. Besides accomplishing all the purposes of the well-known Roller Mill for crushing Corn and Seeds, by an entirely novel arrangement it is made to break Beans and Peas most effectually, and without involving any delay in adapting the Mill from one process to the other. They are very simple in construction, and therefore not liable to get out of repair; may be worked with ease by one man, and for efficiency and cheapness are superior to any Implement of the kind yet manufactured. Price complete, 9*l.* 9*s.*

E. R. T. and Co. also manufacture a Roller Mill for Crushing only, of the same size as the Registered Roller Mill, and a larger Mill, for which HARWOOD and TURNER were awarded the Royal Agricultural Society's Prize at Norwich in 1849.

Price of Small Roller Mill ... ... ... £7 10*s.*
,, Norwich Prize Mill for Horse, Steam, or Hand Power ... ... ... 10 10

Delivered Free to London, Norwich, Bury St. Edmunds, and all intervening Stations. To Hull by water, and all places within 30 miles of Ipswich.

A Discount of Five per cent. allowed for Cash payments.

CUCUMBER and MELON BOXES and LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England.—JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the Public that his mixtures of the Natural Grasses and small Clovers—excluding no sort which is proper to form a PERMANENT PASTURE, as the soil &c. may direct—are now ready; delivered on the railway free of charge, at 1*l.* per acre, allowing 3 bushels as seed for an acre; also Lawn Mixtures, and the sorts separate. They are gathered under his immediate superintendence, and are quite new; this unprecedented low price last year, and the prospects of agriculture, having created an unlooked-for demand.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

IRISH PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

THE IRISH AMELIORATION SOCIETY beg to draw the attention of the public generally to the fertilising and deodorising properties of Irish Peat Charcoal. Mixed with night-soil or sewage matter it instantly and wholly destroys all offensive smell, renders it easy of manipulation, adapts the fertilising properties as a ready food for plants, and enables it to be transported by Railway or any other conveyance without the slightest inconvenience.

The extent to which Charcoal (carbon) enters into the composition of every article of agricultural produce, and the value of night-soil as a manure, render any observations on these points unnecessary. Mixed with night-soil, in about equal weights, a most efficacious manure is produced at a very small cost.

Price of the Charcoal, ready for use, at Dublin, exclusive of sacks, 35*s.* per ton; in London, Liverpool, Bristol, and other seaports in England, 48*s.* per ton, exclusive of sacks; or 60*s.* per ton, sacks included.—Agents for the sale of the Society's Charcoal have been appointed at several of the principal seaports and Inland towns, a list of whom, together with all other information, may be had on application at this office.

By order of the Court,
Feb. 8, 1851. GEORGE L. PARROTT, Secretary.
Head Office, 9, Waterloo-place, London.

KING'S ROAD, CHELSEA.

REGISTER FOR GARDENERS.—No charge except for Postage.—The Nobility and Gentry, in want of Gardeners, Bailiffs, Foresters, &c., are respectfully informed that Gardeners are here classed according to their various qualifications. By sending full particulars, such Gardeners only will be introduced as are worthy, and well adapted for each particular situation.

Gardeners in want of situations are requested to apply to J. WEEKS and Co., Horticultural Establishment, Chelsea.

MESSRS. HAY, SANGSTER, AND CO. will be ready to supply their prepared POTATO CUTTINGS about the middle of April next, the produce of which proved so highly satisfactory last, as well as the experimental trials of the three former years, as to QUALITY, QUANTITY, and SIZE, being more than double the crop this year of those planted in the usual way, and obtaining a much larger quantity of starch, which is so essentially necessary to the preservation of that valuable root. A report of the analysis will be inserted next week, being now in the hands of first-rate professional men. Our own experiments give about one-third more saccharine matter than the best we could procure grown under the old system. All orders must be to hand on or before the end of the second week in April, as H. S. and Co. are preparing to plant a large breadth, and will only provide for what may be ordered up to that time. Post-office orders to be made payable to JOHN SANGSTER, at the Borough Post-office, Southwark. Printed instructions for planting and management will be sent with the plants ordered.

The advantages offered by this Society are—Economy combined with Security, and Lower Rates of Premiums than those of any other office, which entitle the Assured to participate in the profits, and considerably lower than those of any other Mutual Insurance Society.

The whole of the profits are divided every fifth year among the Assured, and a Bonus is added, after the payment of the Fifth Annual Premium, to every Policy effected on the participating scale, if a claim accrue thereon prior to the next division of profits.

The Bonus declared in 1849 (arising from the whole of the profits), upon the mutual principle, averaged 62½ per cent. on the premiums received.

Loans granted on such Policies as are purchasable by the Society.

The Assurance Fund exceeds 1,000,000*l.* Income 180,000*l.* per annum.

The subjoined Table shows the advantages offered by the Society, resulting from low premiums, and a division of the entire profits among the assured:

| Age at Entry. | The Annual Premium, according to the Northampton Rates, to Assure 1000*l.* | Assures by the Economic Rates. | Thus giving an immediate Bonus of | Economic Bonus on Policies of seven years' standing in 1849 was | Also a Contingent Bonus on Policies becoming Claims in 1851. | Total sum payable at death. |

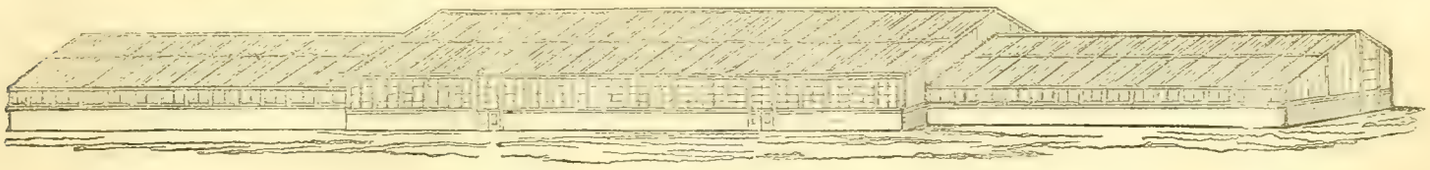
Prospectuses and full particulars may be obtained on application to ALEXANDER MACDONALD, Secretary.

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, LEA and PERRINS, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.



N.B.—To guard against imitations, see that the names of "LEA and PERRINS" are upon the label and patent cap of the bottle.

WIRE FENCING, painted, an effectual fence against hares, rabbits, sheep, cats, dogs, deer, &c.; also for enclosing pheasants, fowls, &c.; for heightening existing walls, fences, &c.; and as a protection against petty thieves:—15 inches high, 3*d.* per yard; 18 inches, 3½*d.*; 2 feet, 4½*d.*; 3 feet, 6¾*d.*; 4 feet, 9*d.*; and 6 feet, 1*s.* per yard; less than 2-inch mesh. Being worked in oil it will not rust when painted, and will last twice as long before it requires repainting as any other kind of wire-work that is made. Also, sparrow-proof wire-work, 2*d.* per square foot; wirework, 4-inch mesh, ½*d.* per square foot. Wire-work to order. Numerous testimonials of approval.—R. RICHARDSON, 21, Tonbridge-place, New-road, London. N.B. As this wire kept painted would last 20 years, farmers and others may, at a small expense, preserve their crops from hares and rabbits.

# GRAY AND ORMSON,

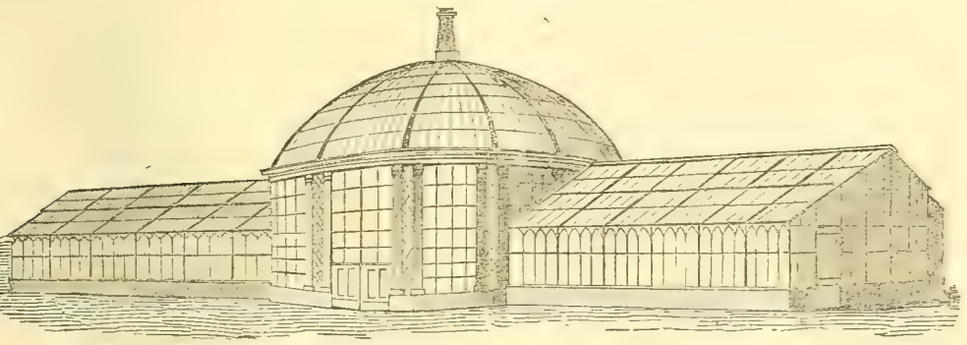
## DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

| Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 10 ft. |
|---|---|---|---|---|---|

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.



(Signed.) "James Fraser, Gardener, Luton Hoo Park."

Two Wings erected for the Earl of Crawford and Balcarras, Haigh Hale, Wigan, Lancashire.
Mr. Varty, his Lordship's Foreman, will answer any inquiry.

THE PATENT consists of two distinct principles for all Horticultural Erections—on one plan the Roof is formed wholly of Iron and Glass, no wood or putty, &c., and not more than three-quarters of an inch of light being taken up anywhere, and is very light, strong, and elegant, free from drip, and perfectly impossible for the rain to penetrate; the other principle consists of the Roof being formed in Sashes, and the surface of the Roof being Iron, Glass, and Putty, and, the work being hollow, is perfectly free from contraction or expansion. These Houses have been proved in all parts, and are found to excel all others. Heating by Hot-water on most scientific principles.

ONE GOOD SECOND-HAND HOUSE FOR SALE.

---

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.
UNRESERVED SALE OF CAMELLIAS OF THE CHOICEST DESCRIPTION, BOTH AS TO FORM OF THE PLANTS AND VARIETIES, FROM MESSRS. LODDIGES.

MR. J. C. STEVENS begs to announce for Sale by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, February 21, at 12 for 1 o'clock, a remarkably CHOICE SELECTION OF CAMELLIAS, from Messrs. Loddiges' Nursery; comprising beautifully formed Plants, from 3 to 8 feet, well set with bloom, and of the following favourite sorts: Double White (very fine), Imbricata, Elegans, Donckelarii, Chandlerii, Candidissima, and a few flowering Plants of the rare and beautiful Aulica.—May be viewed on the day prior and morning of sale, and Catalogues had of Mr. J. C. Stevens, 38, King-street, Covent-garden.

TO GENTLEMEN, FLORISTS, AMATEURS, AND OTHERS.

MR. H. ALEXANDER will sell by Auction at the Mart, near the Bank of England, on WEDNESDAY, Feb. 12, 1851, at One precisely, the finest collection of named RANUNCULUS ever offered for Sale by Auction, from the most celebrated Scotch growers, viz., Lightbody, Waterston, Neilson, Kilgour, and Reid, comprising all the new and most esteemed varieties in cultivation, also several new flowers only in this collection. Catalogues to be had at the Mart, and of the Auctioneer, Shacklewell.

EXTENSIVE SALE OF VALUABLE NURSERY STOCK.

THOMAS PERRY, Nurseryman, Banbury, begs to inform the Nobility, Gentry, Nurserymen, Railway Contractors, and Planters generally, that he has commissioned Messrs. Danby and Caless to offer for public competition, on MONDAY and TUESDAY, the 10th and 11th days of February, about a million of fine healthy FOREST TREES, of nearly every description, including a very superior Stock of the True English Elms, 100,000 Evergreen and Flowering Shrubs, Fruit Trees in great variety, and 500,000 Thorn Quicksets. Catalogues of which may be obtained of Mr. Perry, the Proprietor, or the Auctioneers, Banbury. T. P. begs to call particular attention to his unrivalled collection of Roses.—The above Stock may be viewed the mornings of Sale until 10 o'clock, at which time the Auction will commence.

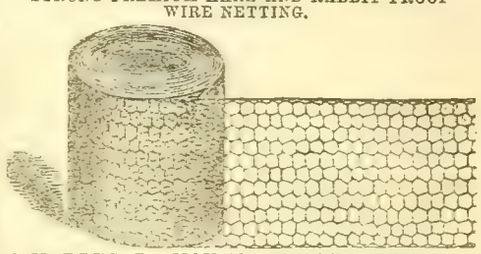
FINAL SALES.
TO NURSERYMEN, BUILDERS, AND OTHERS.

MR. D. A. RAMSAY having received instructions from Messrs. Dennis and Co. to submit the whole of the remaining NURSERY AND OTHER STOCK, GREENHOUSES, IMPLEMENTS IN TRADE, &c., to public competition during the ensuing season, in consequence of the lease expiring at Christmas next, will sell by Auction, on the premises, opposite Cremorne Gardens, King's-road, Chelsea, on TUESDAY, February 25th, and following day, at 12 o'clock, without reserve, a portion of the valuable Nursery Stock, comprising extra large Aucuba, Hollies 3 to 5 feet high, Box, Laurels, and other Evergreens; prize Gooseberries, fruit bearing and other Mulberries; large Ivies, Jasmines, and other Climbers; Roses, Deciduous Shrubs, Garden Frames and Lights, &c. Due notice will be given of future sales of the above stock.—May be viewed prior to sale. Catalogues may be had on the premises; at the principal Seed Shops; and of the Auctioneer, Brompton Auction Ground, Fulham-road, Brompton, near London.

TO MARKET GARDENERS, NURSERYMEN, BUILDERS AND OTHERS.

MR. D. A. RAMSAY will sell by Auction, on the premises, near the Wheatsheaf, New-road, Shepherd's Bush, Hammersmith (late in the occupation of Mr. John Day), on FRIDAY, February 21, at 12 o'clock, the Growing Crops on about five acres of ground, which must be immediately cleared for building; consisting of 1500 of the celebrated Rifleman Gooseberry, and other market varieties, British Queen and other Strawberries, Raspberries, Currants, Rhubarb Roots, Broccoli, and other Vegetable Crops, &c. Also a quantity of Nursery Stock, comprising fine Rhododendrons, Azalea, Hardy Heaths, Grape Vines, Fig-trees, Evergreens of sorts, Fruit Trees, Dwarf and Pillar Roses, Mushroom Spawn, &c., the property of a Country Nurseryman. The whole to be sold without the least reserve.—May be viewed one day prior to sale. Catalogues had at the Wheatsheaf, the principal Seedshops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, near London.

SALE OF AMERICAN PLANTS AND OTHER NURSERY STOCK.



MR. D. A. RAMSAY will Sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton, (one mile from Hyde-park Corner) on TUESDAY, Feb. 18th, at 12 o'clock, 1000 Rhododendrons, Azaleas, Andromedas, Ledums, &c., in fine varieties; Evergreens, Ornamental Trees and Shrubs, a quantity of Bulbs, a choice collection of Pinks, Yellow and other Picotees and Carnations; 1000 Victoria and other Rhubarb roots, Fig Trees, strong Grape Vines, Mushroom Spawn, Ash-leaf Kidney Potatoes, &c.—May be viewed prior to the Sale, and Catalogues had at the principal Seedshops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, near London.

BRENTFORD, MIDDLESEX.—FINAL SALE.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET GARDENERS, AND OTHERS ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are instructed by the Executors of the late Mr. J. Ronalds, to offer to public competition, by Auction, on the premises, the Butts and Twolands Nurseries, about the first week in March, the whole of the remaining NURSERY STOCK, consisting of a rich assortment of Fruit and Forest Trees, Evergreens, Ornamental and Deciduous Shrubs, American Plants, &c.—May be viewed, and Catalogues had, prior to the sale, of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. Samuel Allsopp and Sons, The Brewery, Burton-on-Trent, or their Stores, at 61, King-William-street, City; Cork-street, Liverpool; High-street, Birmingham; the Exchange, Manchester; and 33, Virginia-street, Glasgow.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | | |
|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | .. | .. | £3 15 0 |
| Do. of 100 yards, 24 ins. wide | .. | .. | 5 0 0 |
| Do. of 100 yards, 30 ins. wide | .. | .. | 6 5 0 |
| Do. of 100 yards, 36 ins. wide | .. | .. | 7 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| 1½-inch " light " ... | 8 " | 6 " |
| 1½-inch " strong " ... | 10 " | 8 " |
| 1½-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

YOUR POWERS, PASSIONS, AND PECULIARITIES.—The mystic art of Graphiology, as practised by Professor Ellison, enables him to discover and describe from a single short specimen of Writing, the mental character, talents, and defects, showing what the writer really is, and what worth—the full analysis of character filling a sheet of paper. Send any specimen of the writing of yourself or of those in whose character you are interested, with the fee of 13 postage stamps, addressed to Mr. Raphael Ellison, 151, Strand, London.

Ornamental Trees and Shrubs of all descriptions.
Cedrus Deodara, Cryptomeria japonica, Taxodium sempervirens, } 2s. 6d. to 10s. 6d. each.
Named Double Anemones and Ranunculuses; Gladiolus ramosus and floribundus; Tigridia pavonia and conchiiflora; with many other flowering Bulbs and Herbaceous Plants, which may be planted out till the middle of May.
Carnations, Picotees, and Pinks, per pair, from 1s. to 3s. 6d.
All the better named Heartsease from 6s. to 30s. per dozen.
Fine named Dahlias, per dozen, 12s.
,, Chrysanthemums, new kinds, 12s.
Standard Dwarf and Climbing Roses, 1s. to 2s. 6d. each.
Rivers' Miniature Fruit Garden, with directions for culture and root-pruning, 2s. Rivers's Orchard House, 2s. 6d.
Rivers' new edition of the "Rose Amateur's Guide," 6s.
Paxton's "Cottagers' Calendar," 3d., which ladies and gentlemen should distribute to cottagers.
Collection of 24 Annuals, mixed, recommended by Dr. Lindley as suitable for Shrubberies, 5s.
Seeds for distribution by Gentlemen to their Tenants and Cottagers on the most liberal terms.
24 papers of Hardy Annuals, 5s.
Seeds selected and carefully packed for North and South America, India, New Zealand, and Australia, in the most secure way to arrive safe at any of the above places.

Where a post-office order accompanies an order for any of the above-named Seeds, J. KERNAN will allow, as discount, additional articles to the amount of 2s. in the pound.
Ladies and Gentlemen relying upon the judgment and experience of JOHN KERNAN, instead of being supplied (as is often the case) with what is neither useful nor ornamental, may depend upon having a selection of the most useful and indispensable Vegetables to the amount named, by the parties forwarding him their orders. The same economy will be observed in the choice of Flower Seeds. J. K. feels it almost needless to observe that the liberality of discount will be with the amount.
Although this list is condensed in the present enumeration, all other new and necessary seeds may be ordered. Gentlemen coming to town, having but one day to remain, wishing to take on return plants of any kind, will greatly oblige by giving one day's notice.

WM. DENYER, SEEDSMAN and FLORIST, 82, Grace-church-street, London (near the Spread Eagle), begs to offer the following: *s*. *d*.

ASTERS (GERMAN), four splendid varieties saved by an Amateur in this country, warranted to produce all double show flowers ... ... ... ... ... ... 2 0

BALSAMS, very double, saved from one of the finest collections in the country, six beautiful varieties ... ... 2 0

LARKSPURS, double, eight distinct colours ... ... 2 0

STOCKS (GERMAN), very double, six varieties, best and brightest colour ... ... ... ... ... ... 2 0

The above four collections, all in sealed packages, for 7*s*., or separately at the prices quoted.

W. D. has just received, from a large continental grower, a fresh supply of GLADIOLUS GANDAVENSIS, 6*d*. each, or 5*s*. per dozen—the beautiful dark variety, extra size roots.

A descriptive and priced catalogue of Flower and Vegetable Seeds, &c., may be had on application.

THE BLACK AUSTRIAN PINE.—"PINUS AUSTRIACA."

LUCOMBE, PINCE, AND CO. have a large and healthy stock of this most desirable Pine, exceeding 300,000, from 9 inches to 3 feet high, which having been frequently transplanted, are well rooted and safe to remove; they can offer them, varying according to age and quality, from 20*s*., 40*s*., to 60*s*. per 1000. This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils; growing rapidly and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds.

Exeter Nursery, Feb. 15.

SELECT INDIAN AZALEAS.—Healthy well-grown Plants, with bloom-buds, in 48s or 4-inch pots 1*s*. 6*d*. each:—

| | |
|---|---|
| Alba | Macrantha alba |
| Augusta aurantia | Prince Albert |
| Delecta | Refulgens |
| Double Red | Robertsii |
| Fulgens | Rollissonii splendens |
| Herbertii | Rosea punctata |
| Louvoniensis | Superba duplex. |

THOMAS RIVERS, the Nurseries, Sawbridgeworth, Herts.

POTATOES FOR PLANTING. — Early Shaws, Early Prolific, and White-blossom Kidneys, may be had in any quantity, by applying to HENRY JUER, Battersea, near London.

TO SEEDSMEN AND MARKET GARDENERS.

GENUINE NEW SEEDS.

| | |
|---|---|
| Warner's Emperor Peas | Drumhead Cabbage |
| Clarke's Ringwood Marrows | Mignonette |
| Altringham Carrot | Sweet Peas |
| White Belgian Carrot | Skirving's Liverpool Swede. |
| Improved Jersey Parsnip | |

JOHN SUTTON and SONS, Reading, having grown rather more of the above articles than they will require for retailing, beg to offer them to the Trade, as being Stocks which they can confidently recommend.—*Low prices will be given in answer to applications stating quantities required.*

GRASS SEEDS.

SUTTON AND SONS can supply every kind of FESCUE, POA, and other natural GRASS SEEDS for permanent Pasture at lowest market prices, either separate or mixed, expressly to suit the soil for which they are required.

Any information desired will be furnished in answer to applications by post, addressed JOHN SUTTON and SONS, Seed Growers, Reading, Berks. Also Mangold, Carrot, and Turnip Seeds, of superior quality, carriage free.

HUGH LOW AND CO. have to offer fine large Tubers of the under-named Tropæolums:—

| | | | |
|---|---|---|---|
| Azureum | 5*s*. 0*d*. | Edule | 7*s*. 6*d*. |
| Brachyseras | 1 6 | Tricolorum | 1 6 |

Prices to the Trade on application.—Clapton Nursery, London.

GERMAN FLOWER SEEDS.—Our Selections of the above showy Ornaments of the Flower Garden having for several years given general satisfaction, we hereby announce the arrival of our annual supply, selected by us in Erfurt from those personally known to us as the most select and careful growers. It includes the most distinct varieties of Stocks, Asters, Balsams, Larkspurs, Zinnias, Wallflowers, and Hollyhocks. They will be made up in 5*s*., 10*s*., 20*s*., and 40*s*. packets, and each packet will contain part of the whole collection, if not otherwise ordered by the purchaser.

We have also a carefully selected assortment of all the leading and most approved varieties of Vegetable and Flower Seeds, which we offer at the current prices.

A Catalogue of General Nursery Stock stamped, free by post, may be had on application.

HUGH LOW and Co., Clapton Nursery, London.

LIBOCEDRUS CHILIENSIS, Endlicher (THUJA CHILIENSIS, Don).—A noble Evergreen Conifer, a native of the Andes of Chili and the southern provinces of Antucco and Valdivia, growing to the height of 65 to 80 feet. Sir Wm. Hooker says—

"*It is a tree of great beauty, and well worthy of being introduced into our gardens. There can be little doubt, from its native regions (inhabiting the same elevations on the mountains as the Araucaria imbricata), that it will thrive well in the open ground.*"

The following is an extract from a letter lately received from the well known botanical collector Mr. Bridges:—"In one of the late numbers of the *Gardeners' Chronicle* I see some doubts expressed relative to the Thuja Chilieusis being hardy in England. It will, in my opinion, be perfectly so, judging from what I have seen of the plant in the province of Colchagua, south lat. 35°, which is its most northern limit. It is found near the snow, and where it freezes, I should say, quite as severely as it does in the vicinity of London. Where the tree grows alone it is very graceful, the lower boughs are even on the ground, and it elevates itself to a great height. The timber is esteemed by the natives for building purposes. I have myself seen it as far south as 42°, and I learn it is found in the vicinity of Cape Horn."

Fine healthy well-established one-year-old plants, from seed, in single pots, 7*s*. 6*d*. each, three for 21*s*., or 4*l*. per dozen.

HUGH LOW and Co., Clapton Nursery, London.

CLEMATIS TUBULOSA, FROM MONGOLIA.

HUGH LOW AND CO. having a considerable stock of the above-named beautiful free flowering, hardy, suffruticose plant, producing splendid masses of purple flowers during the autumn months, offer strong plants at 1*s*. 6*d*. each, or 12*s*. per dozen.

They also have for sale very fine, healthy bushy plants of CITRUS JAPONICUS, or as it is commonly called, OTAHEITE ORANGE. Wherever this plant is known, it is universally admired, on account of the facility with which it can be made to produce fruit in abundance in a very small state. Price 42*s*. per dozen.—Clapton Nursery, London.

UNRIVALLED GERMAN ASTERS,

TWENTY-FOUR VARIETIES MIXED.

These superb Globe Asters have never been placed on an Exhibition table without the first prize being awarded to them. The under-mentioned may be considered sufficient to justify their being offered to the public. At the Bath Royal Horticultural Society 10 first prizes were awarded to them. At the Chepstow Horticultural Society, six first prizes; at the Devizes Horticultural Society, six prizes. By enclosing 12 penny postage stamps to J. REID, Nurseryman and Seedsman, Richmond-street, Weston-super-Mare, a packet of seed will be sent in return.

LISIANTHUS RUSSELLIANUS.—Very fine strong plants, 5*s*. each; second size, 3*s*. 6*d*.; third size, 2*s*. 6*d*. Cucumber, Melon, and Lisianthus seeds at 1*s*. per packet. CUTHILL'S pamphlet of 56 pages, containing the Belgian Prize Essay on the Potato, as well as many of the leading vegetables, price 2*s*., or by post 2*s*. 4*d*.; also to be had of HAMILTON and ADAMS, Paternoster-row; or RIDGWAY, Piccadilly.

JAMES CUTHILL, Camberwell, London.

DWARF PEAS.

HAIRS'S Dwarf Green MAMMOTH KNIGHT'S MARROW PEA is perfectly distinct from any other in existence; grows 2½ feet, is three weeks earlier than the old dwarf Green Knight's, and the Peas and Pods are twice the size. 5*s* per quart.

BISHOP'S LONGPOD.—Grows 2 feet high, early as Early Frames, pods as large as Scymetars, and 20 to 24 per stem. 1*s*. per quart.

BURBIDGE'S ECLIPSE.—Grows 1 foot high, pods larger than Imperial, greater bearer, and altogether superior to that variety. 1*s*. per quart.

The above are three of the best Dwarf Peas ever introduced. Full particulars can be had of DUNCAN HAIRS, Seedsman, &c. Wholesale and retail, 109, St. Martin's-lane, Charing-cross, London.

Catalogues can be had on application.

NEW KITCHEN GARDEN SEEDS.—Warranted Excellent quality. Carriage Free! (See below).

| | £ | *s*. | *d*. |
|---|---|---|---|
| No. 1. Complete collection of 20 quarts of the newest and most prolific Peas, with all other Seeds in proportion, for one year's supply ... ... | 2 | 10 | 0 |
| No. 2. Complete collection, in smaller quantities ... | 1 | 10 | 0 |

| No. 4. ditto ditto ditto ... | 0 | 12 | 6 |

*A List of the kinds furnished in the above collections will be found in our* PRICE CURRENT AND GARDEN DIRECTORY, *which can still be had on application.—See* Gardeners' Chronicle, *Jan.* 4, 1851, *back page.*

*** All Seed Orders above 2*l*. delivered Free of Carriage to any Station on the Great Western, Bristol and Exeter, or South Devon Railways; or to Cork, Dublin, or Belfast, by steamers.

Apply to WILLIAM E. RENDLE & Co.,
Seed Merchants Plymouth.

N.B.—All the New Vegetable and Flower Seeds advertised from time to time in this Paper can be obtained from us, at the regular current prices.

HEATHS AND OTHER PLANTS FOR EXHIBITION.

WILLIAM JAMES EPPS begs to state that he has for sale the finest Stock of Young HEATHS and other Greenhouse and Stove Plants possible, which will make splendid specimens in a short time. The superior character of Plants sent out from this Establishment is justly admitted by all who have purchased. The magnificent specimens of Heaths, &c., exhibited by him last season at the Exhibitions at Chiswick and the Royal Botanic Gardens, London, where he received the highest awards, fully justify the foregoing remarks.

Strong bushy Plants can be had at the following low prices, exclusive of packing, carriage paid to London:

| | £ | *s*. | *d*. | | £ | *s*. | *d*. |
|---|---|---|---|---|---|---|---|
| 100 fine varieties of Heaths ... ... | 5 | 0 | 0 | 100 fine vars. of Stove and Greenhouse Plants ... ... | 5 | 0 | 0 |

| 25 ditto ditto | 2 | 2 | 0 | 25 ditto ditto | 2 | 2 | 0 |

All the new leading kinds of Geraniums and Cinerarias 12*s*. to 21*s*. per doz.

Catalogues of the above may be had on application.

Bower Nurseries, Maidstone.—Feb. 15.

AMERICAN PLANTS.

C. LODDIGES AND SONS, in consequence of part of their Nursery being given up for building purposes, they are enabled to offer the following at extraordinarily low prices for cash:—Finest Ghent Azaleas, named, very handsome bushy plants, well set with flowers, and peculiarly adapted for forcing, 18*s*. per dozen; Azalea pontica, 8 feet in circumference, 12*s*. per doz.; Andromeda floribunda ditto, 7*s*. 6*d*. to 10*s*. 6*d*. each; Vaccinium, 30 species, 6*s*.; Andromeda, do., 63*s*.; Rhododendron campanulatum, very fine, 10*s*. 6*d*. each.—Post-office orders made payable at Hackney.

HART AND NICKLIN, FLORIST, Guildford, Surrey, possess a fine healthy Stock of the under-named Plants, which they offer to the public, feeling assured they will give satisfaction to purchasers.

FANCY GERANIUMS—Alboni, Jenny Lind, Reine des Francais, Queen Superb, Magnifica, Wintonia, Jehu Superb, Madame Miellez, Lady Rivers, La Belle de Africane, Beauty of Winchester, Diadematum coccinia, Fairy Queen, Ytolinski; 21*s*. the Set.

GERANIUMS—Emily, Crusader, Brilliant, Belle of the Village, Rosalind, Princess; 21*s*. the Set.

PANSIES—Helen, Juventa, Premier, Negro, Lucy Neal, Polyphemus, Uttoxeter Hero, Conductor, Pre-eminent, Gem, Viceroy, Criterion, Duke of Norfolk, Mr. Beck, Masterpiece, Androcles, Heroine, California, Duchess of Norfolk, Ariel; 20*s*. the Set.

No charge for Package, and Carriage paid to London, or any Station on the South-Western or South-Eastern Railways.

"ORACHE," SUPERIOR IN EVERY RESPECT TO SPINACH.—The leading article of the *Gardeners' Chronicle* of January 25, 1851, fully bears out the above assertion, that this is one of the very best summer vegetables, superior to Spinach in its flavour, and possesses the advantage of affording a constant and permanent supply (without going to seed) of large luxuriant leaves throughout the summer months. It was most successfully grown last season at the seat of Joseph Hume, Esq., M.P., Burnley Hall, in this county, and much preferred to Spinach. Sealed packets 2*s*. 6*d*. and 5*s*. each, per post free, containing a sufficient supply for a large or small family.

Also may be had, Seeds of the "True Custard Gourd," a most delicious Vegetable Marrow. Packets containing 6 seeds, 1*s*., per post free. Payments by postage stamps or Post-office order.—YOUELL and Co., Royal Nursery, Great Yarmouth.

EVERGREENS.—The attention of the Nobility, Gentry, Builders, and all engaged in Planting, is directed to an extensive Stock of fine large Evergreens, consisting of common and Portugal Laurels, common and Irish Yews, American, Chinese, and Siberian Arbor-vitæ, Green and variegated Hollies, Red Cedars, Cedars of Lebanon, and Deodara, Phillyreas, Alaternus, Aucubas, Green and variegated Box, &c., which are to be had of all sizes, from 2 to 7 feet high, and at extremely moderate prices, of JOHN ADAMS, Brompton Park Nursery, Kensington-road, London, opposite the Great Exhibition.

LILIUM LANCIFOLIUM, RANUNCULUSES, ANEMONES, AURICULAS, AND PELARGONIUMS.

HENRY GROOM, CLAPHAM RISE, near LONDON, by appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to recommend to the attention of the Nobility, Gentry, and Amateurs, his extensive assortment of the above FLOWERS. He begs to say that this is a good season of the year to make a selection of the various kinds. Ranunculuses and Anemones should be planted this month.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

PEAR AND QUINCE STOCKS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, St. Helier, Jersey, begs to inform the Public and the Trade that he has the following, of very superior growth, to dispose of:—A few thousands QUINCE, very free and healthy, fit to receive the buds next July, at 40s. per 1000; also PEAR Stocks, of superior growth, two years transplanted, and very vigorous, at 40s. per 1000; smaller ditto, transplanted, and very vigorous, at 35s. per 1000.

This is an opportunity R. L. has never before offered to the Public, for his stock is totally different from the French stock, which has always given R. L. superior growth of trees.—Orders will be punctually attended to. Reference or remittance from unknown correspondents.

SAMUEL FINNEY AND CO.'S CATALOGUE OF SEEDS, for 1851, is now ready, and may be had postage free, on application. It contains a Select List of all the most approved sorts of Culinary Vegetables in cultivation. Also an extensive collection of Flower Seeds, including the imported German kinds, with descriptions, stating the proper time for sowing, hardiness, duration, height, time of flowering, and the colour of each, with much other useful information. The collections of Seeds sent out last year by S. F. and Co. having given general satisfaction, they again offer them as under.

VEGETABLE SEEDS.—CARRIAGE FREE.

We prove the growth of each kind before we send them out.

The above can be had, post free, on receipt of Post-office order, or the amount in penny stamps.
Horticultural Gardens, Norwich, Feb. 15, 1851.

SEEDS FOR THE FARM, THE KITCHEN-GARDEN, AND THE FLOWER-GARDEN.

JAMES SALTER having tested the Growing Qualities of the Seeds he is now sending out, can with confidence warrant them to be as good, and as low in price, as at any respectable Seed Establishment in the Kingdom. All the most approved varieties of CUCUMBER and MELON, 1s. per packet. Flower Seeds forwarded (free) by post. Descriptive Lists, with instructions for sowing, sent on application.

N.B.—Just imported, a Fine Collection of CONTINENTAL FLOWER SEEDS; also, Fine Double ITALIAN TUBEROSES.
SEED ESTABLISHMENT, 2, New Bond-street, Bath.

GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN SEED ESTABLISHMENT,

For Supplying Genuine Home-Grown Seeds Carriage Free.

JOHN SUTTON AND SONS, SEED-GROWERS, Reading, Berks, being extensive Growers of Seeds, and having many Customers in the Southern, Midland, and Western Counties of England, and in South Wales, have made arrangements with the Directors of the above-named Railways (all of which converge at Reading), whereby they are enabled to deliver their Goods *Carriage Free* to any Station on either of these Lines; or to any Railway Terminus in London; or Packet Office in London or Bristol.

SUTTON'S NEW PRICED CATALOGUE OF HOME-GROWN SEEDS, being a careful selection of only the very best kinds of KITHEN GARDEN, AGRICULTURAL and FLOWER SEEDS, *with prices affixed to each article*, will, it is presumed, be found the *most useful* and convenient of any yet presented to the public, the prices being remarkably low, while the sorts are the best in cultivation. *It will be sent post paid on application, enclosing one penny stamp.*

SUTTON'S COLLECTIONS OF GARDEN SEEDS.

*For the convenience of Gentlemen who may not be well acquainted with all the best kinds of Garden Seeds, and the proper proportions of each generally necessary to stock a large or small Garden,* Messrs. SUTTON *have during the last seven years been in the practice of making complete Collections for one year's supply, the economy and other advantages of which system have been fully appreciated by the purchasers, as indicated by numerous recommendations and annual increase of orders.*

The Collections are increased in quality this year, and are far superior to any others yet offered to the public, both in quantity and quality.

| | £ | s. | d. |
|---|---|---|---|
| No. 1. A COMPLETE COLLECTION OF KITCHEN GARDEN SEEDS FOR A LARGE GARDEN, for one year's supply | 2 | 10 | 0 |
| No. 2. A COMPLETE COLLECTION OF DITTO, in quantities proportionately reduced ... ... ... ... ... | 1 | 10 | 0 |

TO GENTLEMEN ENGAGED IN PLANTING.

GEORGE JACKMAN has to offer a large and well-grown Stock of the following at very low prices, which can be had on application.—Beech, 4 to 5 ft.; Chestnut, Spanish, 2 to 3 ft.; Ditto ditto, 3 to 4 ft.; Elms, English, 4 to 5 ft.; Fir, Larch, 2 to 3 ft.; Ditto ditto, 3 to 4 ft.; Ditto, Spruce, 2 to 3 ft.; Ditto ditto, quartered, 4 to 7 ft.; Ditto, Silver, 1 to 3 ft.; Hazel, 2 to 3 ft.; Ditto, 4 to 5 ft.; Hornbeam, 4 to 5 ft.; Oaks, English, 4 to 5 ft.; Ditto, Scarlet, 2 to 3 ft.; Quicks, strong bedded.
Woking Nursery, Feb. 15, 1851.

HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENTS, MAIDSTONE, AND ADJOINING THE SOUTH-EASTERN RAILWAY STATION, ASHFORD.

WM. JAS. EPPS begs to state that he has taken the Nursery and Seed-growing business late in the occupation of Mr. James Cutbush, Sen., adjoining the Railway Station, Ashford, where he is making extensive alterations for carrying on the above business, in conjunction with his Nursery and Seed Establishment, Maidstone. The proximity of the Ashford business to the Romney Marsh (which is the largest and by far the best seed-growing district in the kingdom), will enable him to offer many advantages; great attention will be paid in selecting and growing the stocks true to their kind. He is now prepared to receive commissions from any respectable wholesale house. The prices, per contract, this year are exceedingly low, and any further information upon this subject may be had upon application, also his wholesale and retail List of Seeds.

W. J. E. has a large and splendid stock of the following Seeds, which he can warrant to any extent, and at very low prices—terms, three months, upon satisfactory reference—Shirving's Purple-top Swede, Laing's Purple-top Swede, Mangold Wurzel, White Carrot, Parsnip, Champion of England Peas, Imperial, Victoria Marrow, Blue Prussian, Broccoli, and Cabbages of sorts; Kohl Rabi and Mustard. All seeds carriage paid to London.—Feb. 15.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, &c., may be obtained gratis on application. It describes the colour of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections. He has many thousands of Rhododendron ponticum in sizes very suitable for planting immediately into Game Preserves, very healthy bushy stuff, price 5l., 7l. 10s., and 10l. per 1000.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway, and three miles from Blackwater, South-Eastern Railway.

"HERO OF SURREY" CUCUMBER.

J. BURLEY begs to inform the Public that he has the pleasure of offering the above new Cucumber, with confidence, as a first-rate one for ridge or frame, he having grown it from 20 to 24 inches on the ridge last season, without any bottom-heat. It can be sent by post in packets of eight seeds for 2s., or postage stamps. Pentstemon Murrayanum, strong plants, 18s per dozen.—Limpsfield, Godstone, Surrey.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12s. per dozen. Also Myatt's Linnæus, 12s. per dozen; and Victoria, 9s. per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2s. 6d. per lb. Also, his superior dark-green Savoy, 1s. 6d. per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

CUCUMBER—"PHENOMENA."

EDWARD TILEY begs to offer to Cucumber growers generally the above superb CUCUMBER, which he feels confident will give the greatest satisfaction to them, as did the former kinds sent out by him during the last seven years, being Victory of Bath, Gordon's White Spine, and Lord Keynon's Favourite.

The above splendid Cucumber, "Phenomena," was a hybrid between Hamilton's Black Spine and Mills's Jewess, which it surpasses, both for its prolific qualities and length of fruit, generally growing from 22 to 28 inches. It is a beautiful black spine, of a dark green colour, and free from ribs or shrivels; it also grows quickly, carries its bloom well, and will be found first-rate for exhibition. As a proof of its prolific qualities and length, the following may be vouched for, viz.:—There were cut from two plants, grown in a one-light box, the size of which was 4 feet by 6, 24 brace of Cucumbers, each fruit averaging 22 inches long—total length of the whole amounting to 29 yards 1 foot. It is solid, and eats very crisp. Sold in packets containing seven seeds, 5s.; or three seeds, 2s. 6d.

E. T. has also seed of his three other superb Cucumbers at the following prices:

| | |
|---|---|
| Victory of Bath, per packet ... ... ... | 2s. 0d. |
| Gordon's White Spine, ditto ... ... ... | 1 6 |
| Lord Keynon's Favourite, ditto ... ... | 2 6 |

This last is the best for winter cultivation.

Any quantity of the above will be sent postage free to any part on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

TO CUCUMBER GROWERS.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, having grown from 15 to 20 lights of Aban's Conqueror of the West Cucumber successfully for three years, can with confidence recommend it to the Public, as being one of the best kinds in cultivation. Packets containing 12 seeds 1s. each.

N.B. An extensive stock of Dwarf-trained Fruit Trees, Standard Mulberries, Gooseberries, Currants, and Raspberries of sorts, with a general assortment of Nursery Stock, at very low prices, which may be obtained on application.

THE "BLACK BARBAROSSA" GRAPE.

JOHN BUTCHER begs to call the attention of Grape Growers to the above truly valuable late Grape, introduced from the Continent by C. S. Ward, Esq., and was exhibited at the Horticultural Society's Rooms, Regent-street, London, in January, 1849, for which a Certificate was granted; and again on the 19th February, 1850, when a Banksian Medal was awarded it. In the Covent Garden Market Report of 9th March, it is stated that "Hothouse Grapes, excepting the Barbarossa, are over."

It has the following good properties:—The Vine a most luxuriant grower, a free bearer, large and finely shouldered; berries large and globular, flavour equal to the Hamburgh, will hang on the Vine for at least another month to come without sinking in size of berry or losing in flavour; as hardy as the Hamburgh; the average weight of the bunches 4 lbs. each. To those families requiring late Grapes it will prove a valuable acquisition.—Good plants, from eyes, 10s. 6d. each, including package. London Agent—Mr. FREDERICK WARNER, Seed Merchant, 28, Cornhill, London. May be had of JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

Also Butcher's Hybrid Black Spine Cucumber; length from 18 to 30 inches, exhibited at the Royal Botanic Garden, Regent's-park, 1846, for which a Certificate was granted. 1s. per paper.

Butcher's Shakspeare Cabbage, a nearly splendid variety. 1s. per paper.

Butcher's Early Warwickshire, do., 1s. per paper.

Golden Cos Lettuce, true, undoubtedly the best Lettuce grown. 1s. per paper.

A remittance must accompany the order, either in cash or penny postage stamps, from unknown correspondents.

SPLENDID MULBERRIES.—FINEST PRIZE GOOSEBERRIES.

AS the present is one of the best SEASONS FOR PLANTING, WILLIAM DENNIS and Co., Florists, &c., King's-road, Chelsea, beg respectfully to call the attention of the public to the fact, that the whole of their really useful and Ornamental Stock must absolutely be cleared off this season; and in order to dispose of it as expeditiously as possible, they have called a SALE BY AUCTION, which takes place Feb. 25.; and as it is their intention not to place the slightest reserve on any portion of the Stock, they consider for Gentlemen engaged in Planting, it is an unusually good opportunity. The Stock consists of some extra fine large Fruiting Trees of the Black Mulberry. Pine Plants established in pots, and fine dwarf plants for training. A considerable quantity of Standards of the best sorts of Prize Gooseberries, and above 300 kinds of good bushy Plants, two to five years old; also a large quantity of Evergreens, Deciduous Shrubs, Ornamental Trees, &c. Stove and Greenhouse Plants, comprising fine specimens of Orchidæ, Cacti, fine standard and dwarf bushy Geraniums, Greenhouse and hardy Bulbs, &c. Catalogues may be had on the premises and of the principal Seedsmen, or sent by inclosing two postage stamps.

PEARS.

RENÉ LANGELIER, Nurseryman and Florist, Claremont Nursery, St. Helier, Jersey, Channel Islands, begs to offer the following new PEARS, of the first merit:

BEURRE CLAIRGEAU, bearing the name of the raiser of this valuable Pear.—A very large fruit, perfectly melting, and a late fruit of first merit. Price 5s.

BEURRE D'HIVER.—Also large, and keeps till April, perfectly melting, hardy, and great bearer. Price 5s.

BEURRE NANTAIS.—The earliest Pear known, excellent, and great bearer. Price 2s. 6d.

The above R. L. can strongly recommend. None will be forwarded to unknown correspondents except on the receipt of cash or reference.

MESSRS. STANDISH and NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Feb 15.

BEAUTIFUL, USEFUL, AND CHEAP!
WARRANTED TO PLEASE.

The following COLLECTIONS of SEEDS and PLANTS are deserving especial notice, and are important to all who have a Garden.

No. 1.—100 varieties of HERBACEOUS PLANT SEEDS, hardy PERENNIALS, comprising the most select and beautiful sorts from our unrivalled Collection—never before offered—purchaser's selection, free by post, 1l. 5s.

No. 2.—50 varieties fine do., purchaser's selection, 15s.

No. 3.—25 do. do., 8s.

A list containing height, colour, and time of flowering, with much other useful information relative to their culture, may be had on application.

ANNUAL FLOWER SEEDS—post free.

No. 4.—100 vars. purchaser's selection, from list containing the newest and showiest sorts of hardy, half-hardy, and tender Annuals, 18s.

No. 5.—50 vars., purchaser's selection, 10s.

No. 6.—25 do. do., 8s.

Or we shall be happy to make selections for purchasers of the quantities at the above prices. The Annuals will be contained in Ayres and Moore's descriptive cultural labels.

The following are WARRANTED GENUINE, and are very superior:

HOLLYHOCK, from a most superb Collection of named double flowers, per packet, 1s.

CINERARIA, from the newest and best show flowers of 1850 per packet, 1s. 6d.

CALCEOLARIA, do. do., splendid, per packet, 2s. 6d.

PANSY, do. do. do., per packet, 1s.

PETUNIA, do. do. do., per packet, 1s.

N.B.—The above five unique lots may be had separate, or if required will be included in Collection No. 1. They have all been collected from our own plants and purchasers may rely with confidence on their quality.

GREENHOUSE PLANTS.

ERICAS, 50 fine healthy plants, most of them large enough to bloom the coming season, and all ready for growing into specimens. Purchaser's selection from list, in 50 superb varieties, for 3l. 10s.; or per doz., 21s.

ERICAS, 50 finest vars. as above; large plants, own selection, for 2l. 10s.; or 15s. per doz. In the above Collections will be found all the leading sorts of the day, selected with the greatest care for beauty and display.

MISCELLANEOUS GREENHOUSE AND STOVE PLANTS.

50 superior varieties, purchaser's selection, comprising the handsomest species and varieties of all the leading kinds, for 3l. 10s., or 21s. per dozen.

50 varieties as above, own selection, 2l. 10s., or 15s. per doz.

CHINESE AZALEAS.—20 fine varieties, purchaser's selection, for 25s., or 18s. per doz.

20 do. do., own selection, for 21s., or 15s. per doz.

ROSES.—50 splendid sorts Standards, own selection, per 100, 5l.; or 18s. per doz.

100 fine varieties, Dwarfs, in 100 sorts, 2l. 10s.; or 9s. per doz., own selection.

CALCEOLARIAS.—Fine healthy, established Plants from the most eminent growers, per doz., 30s., own selection, of best sorts. When the selection is left to ourselves purchasers are desired to furnish lists of such plants, seeds, &c., as are already in their collections, that duplicates of any article may not be sent, every wish will be strictly complied with.

HOLLYHOCKS, No. 1, fine double named kinds, all shades of colour, 9s. per doz., or 2l. 10s. per 100. HOLLYHOCKS, No. 2, for border display, very good, 6s. per doz., or 1l. 10s. per 100. These are selected out of some hundreds of seedlings, and may be confidently relied on.

HERBACEOUS PLANTS.—Purchaser's selection, from List, per 100, 3l. 3s.

W. May's selection, extra fine, No. 1, 2l. 2s. per 100;
" " really good, No. 2, 1l. 10s. "

Having an immense stock they can be furnished at these low prices. The collection extends over 700 species and varieties selected from the choicest stocks in the country (regardless of expense) for display, and warranted second to none. To meet our customers in every way, we hope to be favoured with lists of such plants as are already in their collections, that duplicates of any articles may not be sent where the selections are left to ourselves.

FLOWERING SHRUBS AND ORNAMENTAL TREES.—The finest varieties, purchaser's selection, from the list, per 100, 3l. 3s.

W. May's selection, No. 1, extra fine, per 100, 2l. 2s.
" " No. 2, good kinds, " 1l. 5s.

This Nursery has long held high celebrity for possessing a most splendid stock of flowering shrubs, extending over upwards of 600 species and varieties of the choicest kinds. Some hundreds were selected by Mr. E. Kemp, for the Park at Birkenhead; and for correctness of naming, quality, and health, not excelled by any.

To gentlemen forming Arboretums, or making extensive Ornamental Shrubberies, this is an opportunity seldom offered.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4l.; or per 100, 10s., fine healthy stuff; 2 to 3 feet, bushy, extra fine, per 1000, 5l.—per 100, 15s.

GOOSEBERRIES, all the finest Lancashire show sorts, per 1000, 4l., in 100 varieties, or 10s. per 100 in 50 varieties; the stock extends over 30,000; and is very fine and healthy.

CURRANTS.—White, Red, and Black, including Black Naples, per 100, 10s., fine.

Catalogues may be obtained on application, and the fullest information will be given. Apply to John May, to whom all Post-office orders must be made payable. Orders above 5l. carriage paid to London, or within 150 miles of the Nurseries. Address William May, Hope Nurseries, Leeming-lane, Bedale, Yorkshire.

LARGE SURPLUS STOCK OF FOREST TREES, SHRUBS, &c., NOW ON SALE AT RENDLE'S NURSERY, PLYMOUTH. Established 1786.

WILLIAM E. RENDLE and Co., Plymouth, *have a large SURPLUS STOCK of the following TREES and SHRUBS; and as the ground is required for other purposes, they will be sold at the following low prices:*

*** CARRIAGE FREE (See below).

LARCH FIRS.—We have a very large stock of fine stuff, about 3 feet in height; the price will only be 18s. per 1000.

BERBERIS AQUIFOLIUM.—A large quantity of fine stuff, 18 inches, 16s. per 100. This is a fine shrub for underwood.

SCOTCH FIR.—Large stock of fine stuff, 24 to 30 inches in height, 15s. per 1000.

PINUS AUSTRIACA.—We have an extensive stock of this valuable tree, of the finest possible growth, 12 to 18 inches, fine and stout, 35s. per 1000.

*** *This is a most excellent hardy Pine, being very superior to the Scotch Fir.*

PINEASTER.—18 inches, good stuff, 18s. per 1000. *First-rate Pine for the sea coast.*

ASH.—4 feet, 20s. per 1000.

BALM OF GILEAD.—3 to 4 feet, handsome species of Fir, 4s. per 100.

LILACS, 4 feet, 6s per dozen.

LAURESTINUS.—2 feet, bushy, 6s. per dozen.

BAYS.—18 inches, 5s per dozen.

RHUBARB: MITCHELL'S ROYAL ALBERT, *the earliest of all.*—We have more than a thousand strong roots, 15s. per dozen.

RHUBARB: MYATT'S VICTORIA, very strong roots, 15s. per dozen; smaller ditto, 9s. per dozen.

RASPBERRIES: RENDLE'S LARGE BEEHIVE.—This is a large handsome variety, very prolific, delicious flavour, and has given the most complete satisfaction to all. Strong Canes, 20s. per 100; 3s. per dozen.

STRAWBERRIES: KITLEY'S GOLIAH, 3s. 6d. per dozen; 20s. per 100. CUTHILL'S BLACK PRINCE, 2s. per dozen; 10s. per 100.

SEAKALE AND ASPARAGUS in large quantities, very reasonable.

BLACK NAPLES CURRANTS, very superior to the old sort, 6s. per dozen.

CEDRUS DEODARA.—Fine stock of nice young seedling plants, two years old, in pots, 6s. per dozen.

*Our Catalogue of Forest Trees, Shrubs, and Fruit Trees can be obtained for one penny Stamp.*

All orders above 5l. will be delivered Carriage Free to any Station on the Great Western, Bristol and Exeter, or South Devon Railways; or to Cork, Dublin, or Belfast. Steamers from this port to Cork, Dublin, and Belfast twice a week.

*The South Devon Railway is now open to Plymouth; the Station being within one minute's walk from our Counting-house.*

All Orders will be executed in strict rotation.

*** We have a few fine Trained Yews for Hedge work, 3 to 4 feet in height, and will spread as much, 24s. per dozen.

William E. Rendle and Co., Nurserymen, Plymouth. Established 1786.

**The Gardeners' Chronicle.**

| | | | Royal Institution | 3½P.M. |
| Saturday, | — | 22 | Royal Botanic | 3½P.M. |
| | | | Medical | 8 P.M. |

To the many cases of unusual structure, illustrating the doctrine that flowers and fruits are mere modifications of leaves, we have now to add the following, examples of which have been sent by our correspondent, "A. G. N." He states that he found an abundance of similar cases on an Easter Beurré Pear tree, which he lately pruned, and which bore, last year, a fine crop of large and beautiful fruit.

It will be evident that the two specimens now figured represent a couple of branches of the Pear tree, producing three abortive fruits, out of the centre of two of which twigs have grown. But that is not all. At *c* there is also a lateral fleshy shoot hollowed out obliquely at the extremity, where it shows a few scales or rudiments of leaves, and has its whole substance fleshy; and so at *b* and *a*, although but one leaf has left its trace behind; yet the whole branch has become swollen and soft, as if about to become a Pear.

From this we may infer that the same tendency to change the nature of leaves, which results in the combination of several leaves into a solid fleshy fruit, may also operate upon the very branch itself on which a fruit appears. And that in this way a fruit may consist, not merely of a number of rows of transformed leaves, but of a transformed branch in addition. Of this fact, indeed, we have a well-known illustration in the Chinese tree, called Hovenia, whose fruit consists of a swollen fleshy fruit-stalk, which is succulent enough to be eatable, and of a hard dry uneatable capsule, formed in the usual way from modified leaves. Upon this view, we must say then that the long tapering Pear is a fleshy branch, hollowed out at the upper end, where it terminates in numerous transformed leaves partially blended with it into one common succulent mass.

We have long since shown that this must be the case in many instances, and that, in truth, the hep of the Rose can be interpreted in no other way; but although that is so, it by no means follows that the practice of the gardener requires alteration in consequence. On the contrary, the important doctrine of vegetable transformations is more confirmed than weakened by such examples as that of the Pear tree in question.

---

Everybody is now inquiring about the health of the Elms in Hyde Park, enclosed beneath the roof of the "Crystal Palace." "Will they live? Are they dead? What will become of them?" are questions asked in every direction. The world seems to be as anxious about them as if they were of value; as if they had conduced to the ornament of the Park, or in themselves possessed some elements of beauty, or had been associated with great events, or were living records of national deeds of glory. Yet no such interest attaches to them; the greater part are decrepid and stagheaded, frightful as trees, worthless as timber, associated with no greater event than being planted by one of King William's Dutch gardeners, and records of nothing except the power of what is miscalled public opinion, when brought to bear upon the Houses of Parliament.

No gardener would fear for the life of these Elms, now that they are to remain for a season under glass; for their roots have the freest access to air through the spaces between the flooring-boards which cover the ground, and Mr. Paxton has pledged himself to the roots being abundantly provided with water. Two, then, of the conditions requisite for their health, namely, air and moisture to the roots, are amply provided. Of air and light to the branches and leaves there will be abundance beneath the crystal vault where they are placed, and there is no reason to apprehend ill consequences from heat. It will perhaps turn out that the building in the Park will be over cool rather than over hot, when the apparatus for ventilation is set to work; but supposing the internal temperature to be all that our sun can produce in the dogdays, there is no probability of the trees suffering on that account. The "English Elm" is a doubtful native of Great Britain; if really wild here it is on the most northern limits of its natural range. Spain and Southern Europe are its favourite resort, and there is little reason in fearing lest a Hyde Park summer, even beneath a vault of glass, should equal in intensity that of the Mediterranean. On the contrary, well watered at the roots, screened from the soot and dust of London by an arch of glass, and warmed by a sun of more than usual fervour, it is to be anticipated that these "trees of liberty," as some one calls them, will be penetrated by a vigour they never knew before.

And herein, in the augmented force of vegetation of these Elms, lies such danger as attends their remaining where they are; they may not die, but they may be the cause of death to others. The truth is, they are rotten to the core; a dead and decaying body is covered by a living skin. A few days since, one of the most careful workmen in the building was severely hurt by a fall, in consequence of having trusted himself to a stout limb, which snapped beneath his weight; although alive in appearance, it was as brittle as a Carrot. To what extent this rottenness goes, may be judged of by two of the very trees over which Parliament has thrown its shield, and which a few years ago broke *across the solid trunk*, some feet from the ground, destroyed by the weight of their own heads. Now if it should happen that the branches of these old trees become loaded with foliage more healthy than usual, they will have a more considerable weight to bear; and it is by no means impro-

bable that the additional weight will snap the limbs, in which case accidents may occur against which no care or skill can guard. It is therefore a very serious question, whether those trees, to which this statement is applicable, can with safety be allowed to remain within the building. It is fortunate that they all stand where the first-class refreshment-room is to be placed, because those who have the power to cause their removal are the very persons who are most likely to suffer from accidents attendant upon their remaining; so that a catastrophe will, at least, serve to increase the list of cases of self-immolation, and thus a great lesson will be read to foreigners, who will not fail to admire the patriotism that would rather put its life and limbs in jeopardy than sanction the destruction of a rotten tree.

## MARKET GARDENING ROUND LONDON.

No. VII. Rhubarb.—Mr. Joseph Myatt, of Deptford, who is celebrated for his fine Rhubarb, was the first to cultivate it on a large scale. It is now nearly 40 years since he first sent his two sons to the Borough Market with five bunches, of which they could only sell three. Next time they went they took ten bunches with them, which were all sold. Mr. Myatt could even then see that Rhubarb would, in time, become a public favourite, and the result has proved the correctness of his views, for it is now generally used both by rich and poor; it is no longer called "physic," as it was wont to be in bygone days. Rhubarb will grow in almost any soil, provided it is rich; but light land, well manured, will always produce a better flavoured stalk than a stiff, retentive clay. We have had a great deal of rain this winter, and Rhubarb in consequence is not near so well flavoured as in a dry and rather frosty season; the stalks are full of watery juice, which the roots have taken up; and in some places the tops of the leaves are beginning to rot amongst the straw. This has led some market gardeners to adopt means of keeping the roots dry. Mr. Mitchell, of Enfield, has grown his Early Rhubarb this winter in the following manner. He lifted the roots, packed them, with a little mould between them, on the floors of long sheds, and covered the crowns 2 feet thick with tree leaves. These produced sufficient heat to bring it forward gently; and I never saw better or finer Rhubarb at Christmas. The usual plan of forcing it about London consists in digging long pits to the depth of 2 to 3 feet, introducing 18 inches of hot dung, and then packing the roots closely together in a little mould, covering the crowns with hoops or with 6 inches of straw; then hurdles or mats, and finishing with 6 or 8 inches of straw, the amount of the latter depending on the severity of the winter. In this way strong well flavoured stalks are produced, provided the weather is dry. The colour is bright red, and the leaf is always very small. Many prefer forced Rhubarb, on account of its tender fibre. No skinning is required, and it is much less acid than that from the natural ground. Those who desire this kind of Rhubarb, therefore, might easily obtain it by placing about a barrowful of straw over each crown. This covering would be cheap, and, besides bringing it on a little earlier, it would help to manure the ground and keep off frost. Rhubarb growing out of doors is so simple that little can be said respecting it. The ground being heavily manured, a plant is taken up and divided into as many eyes or buds as it possesses. These are planted 4 feet apart, and by the autumn they will have produced roots from 6 lbs. to 10 lbs. in weight. The oldest roots are generally taken up for forcing; and by always having a good rotation, the grower has the power of continually changing the ground, and thus obtaining a heavier crop. The forced plants will furnish eyes for a continual succession, without growing plants for the purpose, and the eyes may be divided and planted again for a main crop. I have practised this plan on a small scale many years ago.

The following are four first-rate sorts: Mitchell's Early Albert, Randall's Early Prolific (this is as yet little known, but it is eight or 10 days earlier than the Linnæus; it is high coloured and well flavoured), Myatt's Linnæus is next in earliness, and Myatt's Victoria is the latest. Twelve heads (leaves and stalks) of the latter weighed 70 lbs.

Early Peas.—These are sown in rows 3 feet 6 inches apart, in December, on borders under walls, and by the sides of hedges; Cabbages or White Cos Lettuces pricked out of the frames, or from under the hoops, where they were becoming crowded, are planted between the rows. The Peas are never staked up. The sorts used are the Early Frame and Improved Bishop's and Groom's Dwarf. Peas do not now pay the London growers. They are therefore largely grown in Kent, Essex, Surrey, and Bedford, where the ground is equally early and cheaper.

Beans.—The Early Mazagan and Early Long-pod are grown upon warm borders in rows 2 feet 6 inches apart, with some other crop between the rows. The only care they require is taking their heads off after the plants show a fair quantity of blossom. This concentrates the sap, and makes them a week earlier. The main crops of Beans are obtained from the counties above-mentioned. *James Cuthill, Camberwell.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 2.)

No. XVIII.—By purchasing your birds in the manner I have recommended, you will not, cannot be deceived as to their sex. But *more* than this must be regarded in the purchase. All the canaries sent up from the country are young birds; brought up under good tutors (such as the titlark and the nightingale), but apt to degenerate in song if not properly taken care of. To keep them, therefore, steady to their acquired song, do not hang them with any other noisy, racketty birds, but in a room by themselves. A few months' drilling will cause them to be staunch. They may then be suspended anywhere, and associated with any other songsters.*

Those birds are considered most valuable, which lead off with the nightingale's note; concluding with that of the tit-lark. The jug-jug, swelling slur, and water-bubble of the former, blended with the "chewing" and "wisking" of the latter, kept up in a long-continued strain, are, when observable in any of these birds, certain signs of excellence.

There are a vast variety of tastes, and a vast number of opinions, with respect to a "fine bird." With some—a large number!—noise, shrillness, and a rapid execution carry the palm. Others are pleased with a lengthy song, whether musical or not—its duration being regarded as the test of value. *Chacun à son gout.*

For my own part, now that my ear is more attuned to real "music," I infinitely prefer the German canary before all others. Not that all, or a twentieth part of those that are brought over here from Germany are a whit better than those of our own rearing. Some few, however, are placed by "Canary" breeders under first-rate tutors; and they sing with so much melody, so much pathos, so *con expressione*—that their value can hardly be overrated. The birds *I* speak of, will cost from three to four guineas each. The age to purchase them at, is in their second year. They are then "true" to their song. To listen to *these* birds by candlelight, is a treat perfectly indescribable. Their's is the "music of the spheres."

Canaries are of various colours. Those most in request are the Jonque, or bright yellow. The finest are the bright yellow, with an admixture of black spots. They should have no white feathers whatever. Then there are the mealy, the mottled, the buff, and the grey. It must be borne in mind, as I have before remarked, that many birds despised for their colour, are in reality the finest songsters of any. Plumage, therefore, should be a secondary consideration, if you want a good *song* bird.

A bird in good health should be thin and trim; and very sprightly in his cage. If ever you see a bird with his head behind his wing, in the day-time, conclude that "his days are numbered." His sickness is "unto death." Be very careful, when purchasing, to bear this remark in mind. Keep a close eye, also, when any bird is performing a call of nature, on the movement of his tail. If he "bolts" it, like the nightingale, he is in very bad health. I speak, of course, now, of seed-birds. If what is voided be of a darkish hue in the middle, and quickly dry, the bird is in robust health. Previous to dissolution, what passes will be white and slimy, having no black in it. A few hours more, and the curtain will close on *his* career for ever.

Young birds, as I have already mentioned, are apt to be unsteady in their song. All undue excitement therefore must be avoided. Never, under any circumstances, keep hen canaries in their vicinity. Although they may not see them, yet they can hear them twitter; and they will answer each other from morning till night. Thus is the serenity of their minds unduly disturbed, and their strains of melody are interrupted. *Hen* birds should only be kept for "breeding" purposes, and in a room far remote from the males. The male bird may be easily recognised from the hen, by his "dare-devil" sprightliness and vigour. He will be found to sit bolt upright on his perch, and to stretch out his neck at full length, to see all that is going forward. He is also taller, and more vivacious about the eye; the eye of the hen being "tame," and her movements lack-a-daisically "measured." The larynx of the throat is also more fully developed in the male. He opens his mouth to good effect, and every note tells. The hen, on the contrary, jabbers, and makes "much ado about nothing."

Canaries, when young, are most assuredly imitative; if, therefore, you associate them with other birds, let it be with a first-rate linnet, woodlark, or titlark. Whatever strains they may borrow from these, are unobjectionable. They all "discourse most eloquent music."

By the way, all lovers of *candle-light songsters* (which beat *all* others hollow), should associate these four birds in one room, arranged so as they may not see each other, but listen to each other's song. The effect produced by such a choir is enchantingly beautiful.

In order to keep your birds in continual song, hang them up in situations where they cannot by possibility get a sight of each other. I have often heard people express surprise at their canaries not singing; and I have frequently been consulted as to the cause. It has arisen, in nearly every instance, from the manner in which their cages have been suspended in the room. Immediately after the arrangement has been altered, and the birds have been kept out of each other's sight, they have commenced singing in all the joyousness of their nature. The reason is obvious. Their attention, when thus separated, is not diverted from their song; and a spirit of rivalry induces them to do their utmost not to be surpassed.

If you particularly wish your birds to sing by candle-light, darken their cages in the day-time, so as to prevent their over luxuriance in song. Also, keep them scantily supplied with food. When the candles are lighted, when the fire is seen to blaze upon the hearth, and when the cups and saucers are heard to rattle on the table—then you will be treated to "something worth listening to." *William Kidd, New Road, Hammersmith.*

* Several anxious "Enquirers" are informed, that the popular subject of "Breeding" canaries *will* be introduced; and commenced in "Cage Birds, No. 5." Notice will also be taken, in due course, of the "Belgian" Canaries.

## FOREIGN GARDEN GLEANINGS.

St. Petersburgh.—St. Petersburgh, built on the banks of the Neva, in lat. 59° 56′ 31″ N., and long. 47° 59′ 30″ E. (of Paris), is about 1535 miles from Paris; it covers a surface of more than 16,735 acres, of which about 2447 are occupied by nursery and pleasure gardens, 2938 by kitchen gardens, and as many by meadows. The town being 54 feet above the level of the Baltic, the solar heat is able to penetrate the soil to a greater extent than would otherwise be possible, and thus to increase its fertility, and render it more fit for the cultivation of many flowers and vegetables.

In the year 1714, a splendid garden was made, by the orders of Peter the Great, in the Apothecary's Island, with a view to promote the study of botany. Some years later, the Emperor Alexander converted the marshy islands in the Neva into agreeable promenades, which were soon surrounded by elegant villas. We shall hereafter give a more detailed description of these gardens.

The soil for a few miles aronnd the town appears poor and difficult of cultivation; the vegetation is weak, and the woods, composed for the most part of Willows, Alders, Maples, Aspens, and especially of Fir and Birch, attain but a very moderate size, except in the parks belonging to the Emperor and the principal nobility; but on the other hand, the woods and marshes are full of a great variety of bushes, with berries, amongst which we recognised Rubus * and Vaccinium †. The fruits of the former constitute, even at St. Petersburgh, a considerable article of commerce; they are eaten instead of Strawberries.

In spite of its poverty, the soil of St. Petersburgh yields an abundance of market garden plants, and supplies all the wants of the population of this great city. The soil was found, on examination, to consist of a siliceous clay; the stratum of vegetable earth only covers strata of turf and pure clay.

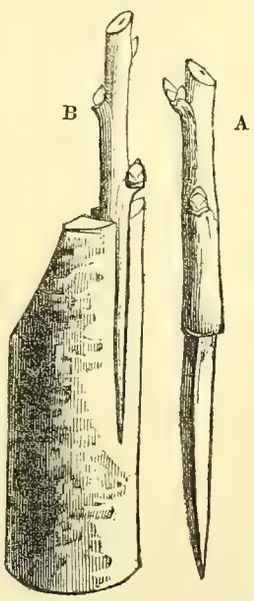
*Its climate.*—The total absence of any shelter from forests, allows the north and west winds to exercise a fatal inflence over St. Petersburgh; and its climate is severe and changeable As to the seasons, as a general rule, winter affords 162 days of continual frost; then follow 40 or 60 days of spring, if that term can be applied to a season in which it freezes regularly day and night; lastly, summer continues for 143 days, and is, without any intermediate stage, followed by winter. The mean maximum degree of cold is —16° F.; but there are always certain days, on which the thermometer stands as low as —22° or —27°. The heat in summer is extreme; in June and July, the mercury often reaches 86° and 91°. The frost usually sets in about the end of September, and continues until the end of April, or even the middle of May.

There are, in fact, but two seasons at St. Petersburgh, viz., summer and winter; for that part of the year can hardly be called spring, when the Neva is still a frozen road. Mild weather is first felt in the beginning of May, and then vegetation is developed with inconceivable rapidity, and in less than a week, summer is at its height. The real summer ends in the beginning of August. In no place is the value of the fine season felt so much; as soon as it makes its appearance, the town is deserted, and every one betakes himself to the country. It is but seldom that the fine days of summer are interrupted by a storm; those we witnessed were short, and not violent. The summer nights at St. Petersburgh are more beautiful than anything we can conceive in our temperate climate. They are like days; we have often sat reading and writing at all hours of the night in June and part of July without any other light than that afforded by Nature. It might almost be said, that in this season the Russian capital enjoys one continuous day two whole months long; for the soft light of night does not disappear until the sun returns to the eastern horizon and announces the approach of day. The greatest length of any day is 20 hours; but, as we have already said, there is at this period of the year, no such thing as darkness, and the vitality of the plants is constantly stimulated by light. *Masson's Report.*

* R. chamæmorus, and arcticus, L. † V. Myrtillus, L.

## VILLA AND SUBURBAN GARDENING.

The rage which has existed of late years for massing plants in beds, has, unfortunately, reached even the villa garden. I say unfortunately, because it detracts from that variety and interest which arises from more general and varied collections. It may be imagined, that what is desirable in extensive gardens, must be equally so in those of limited extent; but this is a mistake, because in the former there is ample room for the display of all kinds of ornamental flowering plants, while in the latter the great art is to bring into so limited a space as much variety as possible, without producing confusion. What are termed herbaceous and alpine plants, have of late years been greatly neglected, arising principally from the prevalence of the taste for massing and grouping individual varieties, so as to produce a blaze of flower at a particular season. The nakedness of such gardens during a great portion of the year cannot be denied, unless the beds are supplied with dwarf flowering shrubs, the expense of which, under the cir-



cumstances, few are inclined to incur. Gardens so laid out should have at least three seasons, viz., the summer display of flowering things, to be succeeded by dwarf ornamental plants; then a spring season of bloom by means of bulbs. A geometrical garden so managed has doubtless a very striking effect, but this can only be carried out at great labour and much expense. I question, however, whether such collective masses ever impart to the man of taste the enjoyment which a more varied arrangement secures. I should therefore urge the occupiers of such gardens to employ a greater number of the different kinds of hardy flowering herbaceous plants, in order that both in winter and summer the garden may be kept to a great extent continually gay. Such an arrangement will always present new charms, whereas the first frosty morning sweeps off the entire beauty of geometrical massing, and leaves the whole a mournful wreck, and such a display can only be reproduced after a lapse of many months.

But the arrangement I am advocating has another recommendation, viz., it is by far the least expensive, both to furnish and maintain. The former requires glass frames or pits to protect the young stock for the succeeding season, entailing continued covering and attention in securing the plants from the inclemency of the weather throughout the whole winter and spring. No such care or expense is necessary in the case of hardy plants, and the immense variety of these which are easily procurable, and which will stand all weathers, gives an opportunity for selection to suit all tastes and situations. If these are planted with some regard to their respective heights and time of flowering, I apprehend that no massing will give the proprietor of a small residence a similar amount of pleasure. *Pharo.*

## GRAFTING.

No. VII Cleft Grafting (*Par. 1st*); with one Scion, and the Stock cut Sloping: fig. 6. (*Greffe à un seul rameau, dont une partie du sujet est coupée en biseau.*)—M. Thouin has named this in honour of Bertemboise. It is one of the most usual modes of propagating many woody plants.

Fig. 6.

*Operation.*—The stock is prepared as indicated by fig. 6. The lower part of the scion, A, should be made thin by slicing off a portion from each side, and forming a small shoulder at the top of the slope, as near as possible to which there should be an eye; the side of the scion on which the bark is left should be broader and longer than the opposite side, by one-fourth, or frequently by one-third, or more, according as the stocks are large or small. For the latter, the inside of the scion should be cut very thin, with a short slope; and when intended for large stocks, the same side should be left fuller, so that the scions may better resist the pressure to which they may be subjected when they are introduced into the cleft. They usually leave two eyes to the scion, but the second is often superfluous; for the one nearest the small shoulder has an immense advantage in this respect, that when the scion is introduced, as is represented at B, it is close to the top of the stock, and as soon as it begins to grow, it forms a basis on the latter, and thus co-operates in healing over the wound of the stock. This position of the lower bud ought to be attended to in all the modes of grafting described in this section.* The scion, such as it is represented, should be introduced in the cleft prepared as follows:—by means of a strong knife, or, preferably, by a sort of cleaver and small bat.† The first of these should be placed across the transverse section of the stock, and driven into the latter in such a manner as to split the bark before the wood; and always taking care that the cleft extend but little, if at all, to the bark on the opposite side, at the lower part of the slope; and on the other side, where the scion is to be inserted, it ought to be, at first, shorter than the wedge-shaped portion of the graft. This being done, the instrument is quickly raised by one or more strokes of the small bat on its under side, thus avoiding any kind of twisting; then the wedge-shaped beak, at the end of the handle of the cleaver, is introduced slightly into the cleft, so as to keep it sufficiently open for the introduction of all the wedge part of the scion; and this should be done in such a manner that the liber, or inner bark of the stock, may correspond as nearly as possible with that of the scion. But as we cannot always judge when this is exactly the case, it is better that the liber of the scion should be slightly outside of that of the stock rather than that it should be placed in contact with the young wood. The graft being properly placed, we cover the wound with a mixture of equal parts of fresh loam and cow-dung; but it is better to do over the parts with the resinous composition adapted for covering the large wounds of fruit trees and others.* This composition ought to be applied more especially on the eye of the scion next the top of the stock, in order to secure it against insects and the bad weather which may supervene. Afterwards, there need not be any uneasiness on account of this coating; when the sap is put in motion, the resin liquifies sufficiently for permitting the growing shoot to pass freely through it. (What I have stated concerning the appliances to this mode of grafting ought to be rigorously observed as regards all the others comprised in this paragraph.) *Translated from the French of D'Albret.*

* The good M. Thouin has not sufficiently urged the importance of this practice, and one of his compilers has not even mentioned it. M. Thouin only states that there are some persons who place this eye in the cleft of the stock; and he adds, with reason, that the upper part of the section of this stock cannot be covered by woody layers, seeing that there is nothing to attract the sap to that part, which consequently dries up, and forms an obnoxious stub in all the trees thus operated upon, not even excepting the Vine, for which this mode of proceeding has been extolled.

† This bat is a small round wooden instrument, resembling a constable's staff. It is used to strike downwards upon the back of the knife, and upwards against its edge.

## GARDEN SCULPTURE.

(Extracts from a Letter to the Very Reverend Thomas Garnier, D.D., &c., &c., Dean of Winchester, and Rector of Bishopstoke, Hants. By Frederick Tatham. London: W. H. Dalton, 28, Cockspur-street.)

If there is one thing above another your excellent taste may have recognised as incomplete and unpleasant, it is that the basement of the good English country gentleman's house, whose white crest you see from a distance as you approach it—

"Bosom'd high in tufted trees,'

should at its basement be immediately overlapped, or nearly so, by long Grass and the wild Briar. There is evidently a principle, which will settle at once an important point on landscape gardening; that *habitation and order are unities.* The gentleman beginning to feel this, having perhaps, not long built his house, the site being a hill rising in a wood, his progress is as follows:—he extends his lawn, makes a parterre; he seeks for a high ridge for a terrace, which is a really valuable ornament; he sets to work to cut down oppressive trees, and pushes the forest well back; plants small shrubs and evergreens, varied as much as possible with other trees, to obtain diversity of foliage, with choice hardy exotics of different shades of green and shapes of growth, avoiding the old style of Portugal Laurels planted in continuous rows; his place looks bare and flat at first, until Nature, with her waving exuberant lines, and her horn filled with plenty, not only follows him, but overwhelms him. He prunes again—something however is even then wanting, he tries a summer house and a conservatory—that does good; but they being the mere artificial and not art, he is still unsatisfied. He sees a vase somewhere, and then he doubts lest it should bring a cockney look to his place; he buys two, as an experiment, and, almost to his surprise, they answer. The trees continue to grow, the plot thickens, and everything becomes every year more gorgeous. Much, it is evident, must now have more, and works of art can only be the accumulate and acme of such a state of things. The straight line which stands for man's rule over Nature is wanting, and that joined with the rotund form also, the straight to act as a contrast, and the rotund to sympathise with all around, he addresses himself to sculpture, with joyful abandonment; statues united with their interlineal forms of pedestal, base, &c., are his alternative, and his place now gives him ample delight—it is perfect: he possesses the fairies to the "Midsummer Night's Dream," he has heightened things into persons, it is now Paradise filled with its inhabitants.

But the decoration of a garden or place in true and perfect taste, is more fraught with difficulty, as you well know, than would generally be supposed. The expense of marble or Sicilian stone, and its getting black in this climate, preclude the employment of great marble sculptors, and they being educated in the routine of monument work, are from habit and line of study not entirely fitted for the fanciful and exuberant, yet corrected and disciplined style requisite for garden sculpture; the consequence is, that when a gentleman has conceived the idea to decorate his garden or grounds, he can run only to a mason who, pressed by demand, may have opened a trade in the cheap and durable material of artificial stone (which, in passing, I may observe is exceedingly appropriate to our use), and who may possess a stock of statues and pateras, some good, some moderate, and some very bad.

The untutored mason has filled churches with painful eye-sores and feeble timorous attempts at monumental architecture. The mere mason may yet do the like for garden sculpture. When the arts were led forward by such great artists as Michael Angelo, Raphael, and Guilio Romano, these men acted as great wheels, keeping in order the smaller ones; but in England, however perfect the tram roads of social order may be, there is evidently too great a distance between the professional man and and the trader. Sir Jeffery Wyattville, who was first a builder, has left one of the finest works of architecture in Europe, Windsor Castle; he was the mature blending of the practical with the inventive; therefore, if it be possible to enlist the able artist who, while practical and constructive, has the variety and beauty of Nature reflected into a large and many-sided imagination, whose loves are with the very flutter of the foliage which is to be the background of his design, and who rejoices infinitely in the pellucid shadows of sun-light, which are to establish his shapes; that would be the most probable way of obtaining a grand work, and then of getting it rightly placed. The situation ought to propose that which it should contain. The pier, the rise of ground, the recess, the umbrageous nook, or the flat open space, should each be treated differently:—what size and character the foliage, how large the limbs of trees, whether the object is a fit one to be seen at a distance, or whether come upon suddenly are all unities and harmonies that would strike the mind as most needful, and require knowledge and perception to develope to the best advantage.

* This consists of Burgundy pitch, four parts; black pitch, yellow resin, and beeswax, of each one part.

The selection of any style should depend on the principal mass, such as the architecture of the house, and should either be in accordance or in judicious contrast, both of which extremes come within the reach of choice, as in music. The height and size are determinable by the house, as you, Reverend Sir, have been kind enough to inform me, and of which your own beautiful place is an illustration; where with so much taste and skill, you have kept the elaborate embellishment of your garden in complete subordination to the simple and rural character of your parsonage.

Now as regards the different styles; the principal and the most common is the Greek, where the external line of all their great works, was to a vase or a patera, what the outline is to the limb; and it is quite evident, that the derivation of all the beauty in their vases (which from the Etruscan downwards, stand as quite up to concert pitch, and any work of art cannot be more in the catalogue of the perfect) was the human form; the figure sculptors, taking no doubt the lead over the Greek potteries upon the principle before mentioned. The Greek, being continually able to study the human form, every subordinate operation of the artistic mind necessarily became exquisite. The Greek style has however of late been much used and abused, being handled by those who do not see its affinity to the figure.

The Egyptian is ponderous and sublime, and when kept away from figures, very grand and massive, but if not used with great judgment, will look barbarous, and bear from sympathy a sentiment of extreme severity and even cruelty. The Roman being intermingled with the Greek generally, nothing need be said of it in this brief sketch. The Gothic and Elizabethan do not apply to figures, but in architecture they are wonderfully harmonious with landscape. The French has with great propriety been much used for gardens and all ornamental work; the serpent line, as Michael Ange'o called it, being the line expressive of life, fitted the French style exceedingly well for out of doors, but the French national tendency to abandon themselves recklessly to the imaginative, rendered their style most abundantly and luxuriously vicious, for which you have only to look over the highly talented, but extreme designs and etchings of their great Le Pautre.

Louis Quatorze took a first-rate thing in hand, the living line, and buried it under the heavy weight of excess and overplus—but of such dead,—"*nil nisi bonum.*"

The rustic may in good hands be made the appropriation of all in one. It must be massive, for Nature is so, it must be flowing, for Nature has life all through it, it must be elegant, for she has that in all her ways, and it must have the sign of rule, and order, for she loves to be in subjection. The rustic thus combined and put together, not treated as the expression of coarseness, but interlined with the characters of tenderness, elegance, and accumulativeness, is the complete thing for out-of-door sculpture, and may, and ought to be made the focus and acme of all the power, plenitude and inexhaustible exuberance of all around it.

## STYLE IN PLANTING.

Everybody makes a great fuss about the ground outline of new planting; but how few pay a proper regard to sky outlines, or to the surface forms of the glade, the vista, or the plantation. "With leaden eye that loves the ground," said one of our British poets, and the critique is, in many instances, richly deserved.

When we cast our eyes through a beautiful vista, and behold the elegant and feathery Beech, with its leafy tracery, the delicate and pensile Birch, with its nodding plumes, the Abies canadensis, or Hemlock Spruce, with its rich and pendulous masses, waiting to adorn a winter's sky, we have an idea of how much lies in the planter's power; whose business it is continually to take *fresh lessons* from the hand of Nature, and to seize on and imitate beautiful combinations, wherever found.

Again, to observe the effect of massive flat-headed forms, as some Oaks, the formal Sycamore, and the pointed forms of some Poplars, or the Larch, peering forth here and there above and amongst them; and the whole *lighted up*, on some fine October morning, with the gorgeous tints of the Liquidambar, the various tinted Maples, and coloured Oaks, and even the old Merry tree—their crimson glow enhanced by the faint yellow of such as the Chestnut and the Lime; we have here a scene which might teach the most apathetic how lavish Nature has been in furnishing the means of gratification to the eye of man, whether in form or colour, or in both combined.

In adorning the banks of water what care should

be taken in a proper selection of forms! The combined effects of some trees or shrubs, in conjunction with the Weeping Willows, all softened down by the limpid and rippled stream, have many a time suggested to me the idea of a Fairy-land in the bottom of the deeps.

There is a disgraceful mannerism frequently to be met with in fresh planting, which deserves severe reprobation. Perhaps these remarks apply in the main to town or suburban gardens; but great places are not wholly free of this rebellion against true taste—this horticultural heresy. I mean the "sticking in"—I will not term it planting—trees or shrubs, merely with regard to their height. Here all "expression" (as emanating from not only a proper selection, but a proper disposition of forms) is lost sight of. To be sure, when all is finished, it is *new work*, and looks charming, as say ladies and gentlemen who have spent half their days behind the counter. And indeed it so happens, that in due time, by means of the chapter of accidents, many a noble form bursts its bonds, and rushes fearlessly upwards; at once a standing rebuke of the planter, and an illustration of the futility of attempting to fetter entirely, either noble forms or minds.

Our greenhouses are generally a pretty good indication of the amount of style the "stager" possesses. I do not say, by any means, an infallible indication, for here the picturesque is out of the question; and moreover the health and beauty of the plants individually have to be considered. The latter very frequently requires that the plants be staged with a frigid formality; such generally occurs with soft-wooded plants, and is indeed a question of light.

When, however, we come to the conservatory style, where we have ample room, and have such materials to deal with as huge Camellias, Rhododendrons, Araucarias, Acacias, the Eucalypti, with other expressive forms, in huge boxes, we have here the means out of which the most beautiful intricacy of outline may be created; almost everything that can be done in a shrubbery may be done here, whether as to forms or tints.

A judicious planter will arrange his finest forms, his greatest heights (ultimately), and, indeed, all his most significant materials, first; all the subsequent planting or filling up, becomes subservient in a very great degree to these. The finishing off the mere ground outline is a very simple affair, and need scarcely concern the points previously alluded to. Yet here there is room for some exercise of taste, in the mere disposal of forms, independent of floral beauty. Where the outline is boldly irregular, the most prominent points should be composed of materials of a bold and prominent character, as they will long continue to maintain the bold indentations of which this style is capable.

If the ground outline is defined by that old and high-starched deformity termed "a verge," why the village tailor will probably make as good a thing of it as the artist. A verge is sometimes, indeed, a thing of necessity; those who are scant of territory (as some of our town gardeners), must needs have a green stripe. I confess, notwithstanding, that I pity the taste of the possessor of acres, if he thus hedge in the beautiful forms of the vegetable world. *Robert Errington, Oulton Park, Nov.* 19.

## Home Correspondence.

*Mignonette.*—I have nice pots of Mignonette just coming into bloom, which were sown in August last. I sowed it in small pots, with the view of economising room, but where space is no object, it gives less trouble, and succeeds equally as well sown at once in the pots in which it is to flower. I have wintered it in a shallow frame, removing the lights entirely in fine weather, so as to give it as much air and light as possible. Many complain that they lose their Mignonette in winter; this, I believe, to be owing to their keeping it too damp. I give my plants little or no water for about three months during the dull season, and I take care to keep them free from drip, which is almost sure to kill whatever plants it happens to fall on. When I employ small pots, I am not very particular about the soil being very rich, provided it is light; but when I sow at once in the flowering pots I use richer material, draining well and placing on the top of the crocks flaky pieces of decayed manure, for the double purpose of nourishing the plants when they are coming into bloom, and for keeping the soil from choking up the drainage. My autumn sown plants, which were shifted into larger pots about Christmas, will blossom from the present time till about May, and another sowing now will succeed them, after which it may be had plentifully in the open ground, but last year having had more plants than I wanted for the stage of my greenhouse, I picked out all the worst pots, topped the plants back about this time, and they came in nicely for my window boxes in May, and which I managed in the following manner. Having some Tom Thumb Geraniums (any other dwarf showy plant, as Intermediate Stocks, would look equally well), I placed three of these in a box, one near each end, and one in the middle, and between them I introduced carefully, so as not to break the ball, my pots of Mignonette, filling the boxes up with rich light soil, and finishing with a good watering, to settle the earth round the balls. The after treatment consisted in keeping the boxes watered always when they required it; for be it remembered if Mignonette is ever allowed to flag it seldom succeeds so well afterwards. Under this arrangement my boxes were greatly admired during the summer months, the Geraniums giving gaiety of colour, while the Mignonette yielded scent. *G. M.*

*How to make a Pollard Tree which shall not decay in a few years.*—Many persons like an old tree covered with Ivy, but the most picturesque which can be procured artificially, are Oak trees with the bark stripped off, which never last many years. My idea is, to get the root part of a good sized Larch, leaving the roots as long as possible, and turn this upside down on a trunk built of old bricks, flints or rough stone; the tree need not be put on the built trunk till the Ivy shall have covered the stonework, whilst the Ivy (pushed forward by bone-dust and liquid manure) is covering the trunk, the Larch root may be getting "mellowed" in the shade. By building the trunk any size can be given and any shape, care being taken to give one complete twist from bottom to top, as is invariably the case in old trees. *Jay, Somerset.* [We can hardly imagine anything in worse taste.]

*Mildness of the Season.*—As remarkable instances of the singular forwardness of vegetation in the Isle of Wight, I may mention having, on the 14th of January, been kindly presented with magnificent blooms of a scarlet Rhododendron, grown in the open air at Fernhill, in this island, the seat of Samuel Sanders, Esq., where fine Rhododendron blooms were also obtained on the 13th of the preceding month. Referring to memoranda of a former year, I observe a note of my having been much struck with the singular beauty and freshness of a bouquet of Rhododendron, grown in the open air, which was placed in the drawing-room of the abovementioned residence, on the 27th of April, 1849, while the surrounding country was completely enveloped in snow. *P. S., Newport, Isle of Wight.*—I sent in to the Editor of the *Cork Constitution* newspaper 11 new Potatoes, dug from one stalk out of several in my garden, planted last August, and which were pronounced by him "to be perfectly sound and healthy." I look upon early sowing as the only safeguard from "the fatal disease;" any one who had them planted in the months of February, both in 1849 and 1850, had them larger and much better eating than those sown later.—All our fruit trees are showing their blossom too soon, and are as forward as they ought to be at the end of March of another year; consequently they will be cut off by the frosts, in the latter end of April and beginning of May. I have had beautiful Broccoli and salads all the winter, and "the British Queen" Strawberry has been showing blossom in a way that must injure its crop in due season. *John B. Warren, Warren's Grove, Crookstown, Ireland, Feb.* 7.

*Seasoning Timber.* — Your correspondent "J. F." expressed a wish to be informed of the manner in which the seasoning of wood might be practised economically on a small scale. There seems no doubt but that it might be effected either by means of warm air, as practised long ago by the Messrs. Strutt, at Belper, or by means of a steaming apparatus, where there may already be one for other purposes. If by warm air, as at Belper, there would be required an air-heating chamber, and a seasoning-chamber above it. The air-chamber need only be large enough to receive a stove, and to afford space for attendance upon it; into this chamber air should be admitted through two pipes, each of them large enough to allow passage for the requisite quantity of air for seasoning the wood, as well as to supply the fire; these pipes should pass to the exterior at opposite points of the compass, since it has been found that when air is admitted on only one side of a building, heated air from within passes out when the wind is in the opposite direction. These pipes should be furnished with slides or valves, so that the one opposite to the wind might be closed at pleasure. Such slides or valves might be made self-acting by connecting them with a vane; but where cheapness of the apparatus is an object of importance, the entrance of air might be sufficiently well regulated by hand. Above the air-heating chamber should be that for the reception of wood to be seasoned, and having communication with the hot-air chamber for the passage upwards of heated air. It would be desirable, if easily practicable, that spaces should be left for the air between the several flooring boards, so as to promote a general diffusion of it, but this is not essential. The seasoning chamber should, of course, be large enough to contain the whole quantity of wood it might be wished to season at one time; the boards, quartering, deals, &c., should be arranged perpendicularly in the chamber, and so that no one piece should touch another, excepting at the point of support, thus leaving a passage for air between each of the several pieces. An exit for air, charged with moisture, should be provided at the part of the chamber most distant from the entrance of the heated air from below. This exit aperture may be formed as a chimney of some height, and surmounted by a cowl turning with the wind, to favour the exit of heated air charged with water. In this way planks were seasoned at Belper in three weeks; deals and thin stuff in a much shorter time. It is evident that the seasoning chamber need not of necessity be immediately above the heating chamber, since hot air might be conveyed from the latter by means of well-jacketed pipes through several stories. Some little experience would be requisite in the use even of this simple apparatus; a carpenter does not make a straight cut at the first attempt. The error most to be guarded against is that of proceeding too rapidly in the drying process, since thereby cracking and splitting of the wood might be expected, or that the interior of it might not be perfectly seasoned, though the outside were so. The great desideratum in seasoning wood is that the external parts should be kept open till all moisture from the interior has been evaporated. The exact heat kept up at Belper, in the drying-chamber, is not recollected, but to the feeling it did not exceed the temperature of a warm summer's day. The degree of heat, would, however, require to be little varied according to the kind of wood to be seasoned, and to its different states during the process of desiccation. A few pounds would pay the expense of the whole apparatus. Seasoning by steam would be more costly on a small scale, excepting where a proper boiler was in use for other purposes; but in the latter case the only additional expense to be incurred would be that of a receptacle for the wood to be seasoned, a pipe connecting this receptacle with the boiler, a tap for turning on or off steam, and a chimney with its cowl, and closable at pleasure. The usual attendant on the steam apparatus for other purposes would be competent to the turning steam on or off from the seasoning chamber. In this mode no injury to the wood need be apprehended from frequent interruptions of the desiccating process, since the seasoning chamber, being filled with vapour, the external parts of the wood within it would be kept moist and open, supposing only that exit of the vapour were prevented by shutting up the chimney. It need scarcely be added that a longer time would be requisite for seasoning wood where interruptions of the steam should have place, and that more or less according to their length and frequency. *M. B.*

## Societies.

Entomological, *Jan.* 27.—G. R. Waterhouse, Esq., President, in the chair. This being the Anniversary Meeting, the chairman delivered an address on the state and prospects of the Society, and on the general progress of the science at home and abroad, during the past year. Messrs. F. Smith, S. Stevens, E. Shephard, and Wilkinson, were elected into the Council, in the room of Messrs. Spence, Stephens, Parry, and Desvignes. Mr. J. O. Westwood was elected President; Mr. Yarrell, Treasurer; Messrs. Douglas and Staunton, Secretaries, and Mr. Janson, Curator, for the ensuing year. The usual votes of thanks to the retiring officers were then passed. *Feb.* 3.—J. O. Westwood, Esq., President, in the chair. The President returned thanks to the society for his election, and urged on the members the necessity of supporting the character of the Society's Transactions and meetings, by the preparation for, and publication of, monographs and memoirs on the natural history and economy, the anatomy, internal and external, and the natural relations of insects. Various donations to the Society's library and museum were announced, including a very large collection of insects from Silhet, in the East Indies, presented by Robert Grant, Esq., of Elchies, N. B. Three new members were balloted for, and elected, and several additional certificates of membership read. The President nominated Messrs. W. W. Saunders, G. R. Waterhouse, and F. Bond, to be vice-presidents. The Publication and Museum Committees were also re-appointed. A highly characteristic full length portrait of the late Honorary President, the Rev. W. Kirby, drawn by W. Spence, jun., Esq., and lithographed by R. J. Lane, Esq., A.R.A., was presented by W. Spence, Esq. It is intended to be inserted in the next Part of the Transactions, and copies were also upon the table for sale to the members. Mr. S. Stevens exhibited two very interesting species of butterflies, collected at Shanghai, by Mr. R. Fortune, one a new Thaumantis, and the other the Papilio Telamon, a species known only by Donovan's figure in the "Insects of China," and which now proves to differ generically from Papilio, and to approximate to Thais and Doritis. [M. Motschulsky has informed the reporter that some of the Coleoptera, received from Mr. R. Fortune are identical with species described by Falder-

mann, in his work on the insects of Northern and Western China.] Mr. W. W. Saunders exhibited various singular moths from Brazil, having the palpi extraordinarily developed, resembling long erect brushes. Mr. Douglas exhibited some sprigs of the common Yew, the leaves of the terminal shoots of which had grown into an oval mass, within which he had discovered a larva which he thought might possibly be that of Ditula angustiorana. He also exhibited a thin silk case enveloped with leaves, apparently formed for the winter residence of some species of spider; Mr. Lubbock also exhibited several similar nests, formed at the top of long Grass, the seeds of several shoots of which had been drawn together and formed into a globular envelope. He had observed a species of Epeira about the cases when half formed. Mr. Stainton had exhibited some living specimens of Oxystoma ulicis, and stated that, although in the perfect state, they remain within the pod until it bursts, making no previous attempt to escape. He likewise exhibited a branch of the common Ilex, the leaves of which were mined by the larvæ of some small moth, and pointed out the difference of habit of the larvæ which mine the leaves of deciduous trees, and evergreen ones. Mr. Westwood exhibited some galls upon the common Vine, received from Sir Oswald Mosley, several of which had been found to contain the larvæ of a species of weevil, a fact not hitherto observed. A very interesting memoir by Mr. W. W. Saunders was read upon the various species of insect which attack the Cotton crops in North America, the West Indian islands, and the East Indies. From the communications of Drs. Royle and Horsfield, and Mr. Simpson he was enabled to increase the number of Cotton insects to 12 different species, the transformations of most of which were illustrated with figures.

## Notices of Books.

*Mémoire sur l'existence d'un Œuf ou Ovule chez les males comme les Femelles des végétaux et des animaux produisant, l'un les grains de pollen ou les Spermatozoides, l'autre les cellules primitives de l'embryon.* Par C. Robin.

This interesting paper, which has reached us in the form of an extract, from the "Revue Zoologique," for Oct. and Nov., 1848, was read first before the Society of Biology, and later in the same year before the Academy at Paris. It is well known that both in the animal and vegetable world, the development of the embryo is due to the division into cells of the grumous contents of the ultimate embryonic sac, under whatever name it may be known; and the author contends that the same, or a similar process, takes place with respect to the male organs. We shall confine our observations to that part of the memoir which relates to those organs in the vegetable kingdom. The pollen grains are thus due to the successive division of the original mother cell or cells of the anther. These grains the author considers to be the proper analogues of the spermatozoa of animals, and not of the grains of the Fovilla, and he is borne out by the fact that the analogues of pollen granules amongst Cryptogams, as far as has been observed hitherto, resemble so very closely true spermatozoa. The author does not seem to be aware that the development of these bodies in distinct cells, somewhat after the manner of pollen grains, has been recorded in Chara and other Cryptogams, but he has given very interesting details as to their formation in Ulva lactuca, having been led to the examination by observing the surface of the pools of water left by the tide at Dieppe, after a storm, to be covered by a green scum, which consisted of four different forms of the so-called Zoosperms of Algæ. Three of these forms appeared to be referable to Halidrys siliquosa, Fucus serratus and vesiculosus; the fourth he was not able at once to assign to its proper origin. As he found, however, that they did not vegetate, and resisted like spermatozoa, and cells of the epithelium, certain chemical agents, he began to suspect that they were not Zoosperms; and on an examination of Ulva lactuca, he observed the development of spermatozoids, perfectly identical, from the central or medullary cells of the fronds.

These cells are first divided by a single partition; and shortly afterwards each of the two new cells is again similarly divided, the partitions being formed simultaneously or shortly after each other. If the cell was originally small, the division proceeds no further, the primary cell not increasing in magnitude. But if there is sufficient room, each of the four cells gives rise to four new cells, and occasionally the 16 cells thus formed are divided once more, making in all 32, the greatest number which the author has hitherto observed. When the division of the cells is completed, a single spermatozoid is formed in each at the expense of its grumous contents. During this process the cells become more distinct, their colour paler, and the inclosed body acquires apparently spontaneous motion, which is at first very slow; but soon becomes lively and energetic, till the membrane ruptures and the spermatozoids escape.

These phenomena, though so complicated, are effected in from three to five hours, according to the conditions in which the cells are placed, or the nature of the cells themselves. After the escape of the spermatozoids, the four ciliæ at the smaller extremity of their ovoid body become visible, being half as long again as the bodies themselves. They resemble exactly the Zoosperms observed by Thuret, but they do not germinate; and a larger number, except in extreme exceptional cases, is produced in each parent.

As regards the motility of these and similar bodies, the author, with great reason, does not consider it as an indication of animality; but precisely of the same nature as that of the bodies on epithelium and other vibratile filaments, whether in animals or vegetables. The bodies then are merely special cells, destined for a particular object, and endowed with motion, and not destined to reproduce bodies similar to themselves, which seems an essential attribute of any insulated specific organism. They are formed in a particular organ by a peculiar mechanism, and they produce in the corresponding organ of the female the formation of similar cells by a similar mechanism.

Such is an imperfect sketch of the view of the author, which opens a curious field for investigation and reflection, and one which can scarcely be without useful results; for while mere fanciful analogies confuse rather than clear our notions, few things are more productive of just and rational deductions than those analogies which arise from the actual study of phenomena in the exercise of an intelligent and well instructed mind. Since the publication of the memoir, an analysis of the prize memoirs of Thuret, and Messrs. Derbès and Solier, has been published. As far as we can judge from the slight sketch there given, they do not confirm the account just given of the development of the spermatozoids (Phytozoaires, Thuret), which, according to M. Robin, is the same in one species, at least of Algæ, as in Ferns, Equisetaceæ, Characeæ, Hepaticæ, and Mosses.

## Garden Memoranda.

Mr. Groom's Nursery, Clapham.—The Tulips in Mr. Groom's beds are from 1 to 3 inches, and in some cases even more above the soil, and consequently they require extra watchfulness, in order to guard them against frost. At one time their growth was at least three weeks in advance of that of ordinary seasons; but lately, the weather having become colder, they have not progressed so rapidly, and it is anticipated that ultimately they will not be much in advance of their usual time. Those in the best bed more especially look uncommonly well; and in order to keep them back, they are allowed all the air and light that it is possible to give them. Ground for Ranunculuses and Anemones, that was dunged and ridged in autumn, to be mellowed by the frost, is now being levelled down and planted. The roots are placed in beds about 5 inches apart each way, and are covered from 1 to 2 inches deep. A bed of the Siberian Squill was beautifully in bloom, its deep blue flowers having a very interesting appearance at this season of the year. It will be found a very suitable plant for rock-work, where its blossoms would contrast admirably with those of the Crocus, Snowdrop, Primula altaica, and other spring flowers, cheating the winter of half its gloominess. The Auriculas in pits exhibited a very healthy appearance, here and there throwing up a premature truss, and the Camellias in the houses were coming beautifully into blossom. Along the front shelf of the Camellia-house the charming little Cyclamen coum was flowering copiously; and associated with it were small "worked" plants of the deliciously sweet-scented Daphne odora rosea, which every greenhouse should possess. In the show house, Amaryllids, of which Mr. Groom has a nice collection, have been and are still very gay; and here we saw three varieties of Crocus, which, on account of their size and beauty, are well worth attention. Their names were, New Large Yellow; Alexander Rizzio, violet purple; and Queen Victoria, white. These are distinct, and decidedly three of the best Crocuses of their colours.

## Miscellaneous.

*The Pine and Cedar Forests of California*—Of all the wonders I have ever seen in the vegetable kingdom, nothing will bear comparison with the magnificent and lofty growths of Cedars and Pines which embellish the hills and mountains that lead to, and make up the great Sierra Nevada Range. The magnificence and grandeur of scenes in which these trees abound, cannot be imagined by any man who has not seen them, and felt the awe and sublimity to which they give rise. I have counted in a circle of 50 feet in diameter, 13 Pine trees, not one of which was less than 3 feet in diameter, or less than 250 feet in height, nor was any one of them marked by the slightest curve or inclination. They are the inimitable and lofty monuments of nature, uninfluenced by sweeping storms and winds, unbent and undecayed by a centurian age. Not a limb or a knot can be found upon their bodies until you reach an altitude of from 100 to 200 feet, beyond which height they continue to grow until their towering majesty overawes all surrounding objects, and affords a fit refuge for the noble bird which adorns the banner of our country. No man can travel through these scenes without feeling that the grandeur of Omnipotence itself is teaching him his finite and insignificant powers. Such was the moral influences of those leviathan growths of Cedars and Pines upon my mind, I would not have dared to have given entertainment to a fugitive thought against the supremacy, wisdom, and power of Jehovah. Such are the Pine and Cedar forests of California. And when you reflect that they cover an area of hundreds, if not thousands of square miles, you are prepared to admit the importance of this claim, which we would urge upon the consideration of our friends in the East. *From the Toronto Globe.*

*Some Account of the Vegetation and Climate of the Auckland Islands.*—"The character of the country is basaltic, with the stone running into columns, much of which is likely to be serviceable, since it is found in pieces of convenient size for building, and in situations from whence it may be easily transported. Whin, or green stone, has been found of very fine quality; also fine sand on Enderby Island. The soil is everywhere rich beyond description, and with a depth of from 7 to 9 feet; it is covered with vegetation from the water's edge to the summit of the hills, that is, with trees, Ferns of a variety of sorts, and Grasses. The trees (of which there are four or five different descriptions) are of a very crooked and twisted form; the wood, however, is very hard, often exceeding 2½ feet in diameter, and a large quantity of knees, breast-hooks, &c., of the very best description for ship-building might be supplied from it. Planks of from 10 to 12 feet in length may likewise be obtained, and much of the wood will, doubtless, be valuable for furniture purposes; but we have not yet found any fit for masts or boat-boards. Although these trees do not often reach an elevation exceeding 40 feet, they are not unfrequently found 60 feet in length, for almost every tree has apparently been bent down about 20 or 30 feet from the roots, and again shot upwards. This will account for the great difficulty experienced in traversing the country, for the passage is obstructed and crossed in all directions by these trees, under and over which you have alternately to pass, and the tops of which are ever covered with foliage as thick and even as the very best trimmed hedge. There is a great variety of tints in the foliage, and but for the number of dead trees, the naked and blanched branches of which meet the eye in all directions in the northern part of the Island, the scenery could scarcely be surpassed; the trees overhang the sea 20 feet, which washes their branches, while under these may be seen wild ducks, &c. The hills gradually rise at the back to an elevation of 800 or 900 feet, with, occasionally, very large masses of basaltic rock cropping out. There are many sorts of Grasses on the Islands and of very fine quality, but on no one spot comprising 10 acres together near the Company's station, or close to the shore, except on Enderby Island, where there is sufficient Grass to depasture many hundred head of cattle; and I am happy to learn that this Grass is to be obtained all the year round. A large extent of Grass land is also to be found on Auckland Island, situated about one mile from the shore on that part nearest Rose Island, which land will be very valuable, and may be made available when a passage to it is cleared." . . . "The officers of the ships of war were particularly struck with the appearance of two different sorts of trees, one well known as the 'ratah,' which was in bloom, and exceeded in brilliancy and extent anything of the sort they had before seen. The other is a very ornamental tree (not described) growing on Ewing Island; the stem is from 18 inches to two feet in diameter, whilst the wood is very hard, and has much the appearance of Maple. It grows rapidly, and has a blossom something resembling the Chesnut, but of a dull lead colour. Its leaves are nearly as large as those of the Fig tree, but of a darker colour; the bark and young stems are covered with a white film-like cotton, and the branches spread out from close to the ground a distance of 25 feet." . . . "The rock which forms the basis of the Company's settlement, is surmounted and covered, except near the water's edge, by a humul or peaty soil, varying in depth from a few inches to several feet, in some instances as many as 10, and affording not only a valuable nidus for the growth of vegetable, but, if properly prepared, an excellent substitute for coals for all domestic purposes. The peaty soil supports a luxuriant vegetation of trees, shrubs, Grasses, Ferns, and Mosses, which together form an underwood so dense that it is almost impossible for man to penetrate unaided through it, except where native paths have been formed, or fire has been permitted to make its way through it. The trees consist of a well-known species of the Myrtaceous family—the Metrosideros lucida; and of one of the Arbaceous or Fig family—the Panax simplex. The principal shrub is a fine species of Veronica, frequently to be met with, and forming occasionally a beautiful feature in the landscape." . . . "As regards the climate of the Auckland Islands, the Commissioner by no means thinks unfavourably of it. His journal shews that although there is much wind and rain at the Islands, as might be expected from their latitude and situation, there is also much fine weather. The circumstance that the New Zealanders (found on the Islands, in all about 70 persons) had resided there eight years without any clothing, and were unwilling to be removed, affords some evidence of the correctness of his views. His experience embraced the summer and the beginning of the autumn months, and he could only surmise as to the character of the winter, respecting which, however, he felt no anxiety. He states that the unfavourable weather which prevailed for some time after the arrival of the expedition affords no criterion for the future, since the New Zealanders reported the summer and likewise the previous spring to have been unusually wet, and that but for this circumstance the vegetables, though of good size, would have been still larger. Respecting the climate, Mr. Mackworth, the Commissioner's chief assistant, remarks: 'We had very bad weather for about a month after my arrival; but during the last seven weeks the climate may be considered quite equal to that of March and April in England.' The New Zealanders had further reported that in winter 'the snow, although sometimes exceedingly heavy, never con

tinues on the ground more than five days at a time.' This statement the Commissioner considers to be in a great measure corroborated by the fact that birds, such as larks and other small land birds which do not migrate, are very numerous, and must find the means of obtaining food during winter. He concludes his remarks upon the seasons in the following terms : 'That the quantity of rain or snow during winter cannot be very excessive, there is very conclusive evidence, to which I have drawn the attention of all parties—namely, that the streams of water, which are very numerous and often very considerable, in no one place present indications of having been extended : the soil on each side is always loose, deep, and rich, and covered with rank vegetation ; nor are there any traces visible of trees having been washed down, but, as in all other parts, they bear the same twisted and bent form.'" *Southern Whale Fishery Company Commissioner's Reports, dated 25 April*, 1850.

*Composition for rendering Canvas and other Fabrics, and Leather, Waterproof.*—This invention, for which a patent was taken out in July last, is the property of Mr. Jennings, Chemist, Great Tower-street, London. It consists in obtaining an insoluble varnish, applicable to the waterproofing of fabrics, from the decomposition of any soluble mineral or metallic salt, by any soluble soap, by double decomposition. The *modus operandi* specified by the patentee is as follows :—1 cwt. of soft soap is boiled in a copper vessel, in from 25 to 30 gallons of water. When dissolved, from 56 to 66 lbs. of sulphate of zinc are added. Double decomposition ensues, and the alkali of the soap unites with the sulphuric acid from the sulphate of zinc, and forms sulphate of potash. The oxide of the zinc combines with the oil or stearine, and forms an insoluble metallic soap. In the case of hard soap being used instead of soft, sulphate of soda will result instead of sulphate of potash. This metallic soap, which is collected from the solution when cold, and has the appearance of a white hard mass, is subsequently boiled to purify it from any sulphate of soda or potash which may remain. Next, heat 50 gallons of raw Linseed oil, as free as possible from mucilage, mixed with 5 lbs. of carbonate of potash and 1 gallon of water, until it saponifies. Then add 10 per cent. of animal charcoal, and an equal quantity of water ; continue the boiling for an hour ; filter, to remove the phosphate of lime and other matters which would tend to render the oil opaque. This last process need only be used when a colourless waterproof varnish is required. To this quantity of oil, thus purified or not, add 1½ lb. sugar of lead, 2 lbs. litharge, 4 lbs. red lead, 21 lbs. black resin ; maintain these matters at 212° Fahrenheit, until their mixture is completed, taking care to stir them all the while for that purpose. Then incorporate with them 30 lbs. of the metallic soap, after which, add 48 ozs. of caoutchouc, dissolved in 2 gallons of oil of turpentine. The mixture may be applied to fabrics at a temperature of from 150° to 160°, by a brush. One or more coats may be applied as required. When cooled, which generally takes about 36 or 40 hours, the fabric will be waterproof. To waterproof leather, it should be steeped in a solution, at 225°, of equal quantities of linseed oil and metallic soap, until cold. Then remove, by scraping, the mixture in excess. *From the Architect, Feb. 8.*

## Calendar of Operations.

*(For the ensuing week.)*

### GENERAL REMARKS.

There are so many things which can be done within doors to forward the work of a garden, that no workman need ever be exposed to wet. There is a double pleasure in seeing the men at work in the sheds and houses during inclement weather, for while we know that they are usefully employed, we are equally certain that their health is not likely to be injured. In a well regulated garden there is always an abundance of work to be done under cover, such as washing and painting sashes, making baskets, pointing pea-stakes and flower-stakes, and a great many other things too numerous to be named here. To carry on such work to the best advantage everything should be in readiness for the men to commence work at any moment, when driven indoors by bad weather.

### PLANT DEPARTMENT.

Stove plants generally do best when plunged in some medium supplying bottom-heat ; and it is particularly beneficial to them when newly potted, by assisting the roots to freely penetrate the new compost. Get all plant trellises painted, that they may be ready for use when required. Besides conducing to their preservation and neat appearance, the paint effectually smothers any insects or eggs which may be lurking about them. Active exertions should now be made to eradicate scale, mealy bug, or other insects, with which any of the plants (particularly those in the stoves), are infested. Hot water is the best remedy ; it may be safely used at 130°, and even higher. It may undoubtedly be applied much hotter, at this season, on the old well-ripened shoots and leaves, than would be safe a month or six weeks hence, when the plants have commenced their new growth. Insects of all kinds can be eradicated with much greater ease, now that they are, comparatively speaking, in a dormant state, than they can be a few months hence.

### FLOWER-GARDEN AND SHRUBBERIES.

Continue to regulate the plants in the shrubbery ; and where large deciduous trees are standing among them, it will beneficial to the shrubs to have a top-dressing of decayed leaves worked in among their roots. If not assisted in this way, the trees, by shading and robbing them, soon destroy the beauty of the evergreens, and often cause unsightly gaps, which are difficult to fill up. A circle of bare ground is frequently left round specimen trees and shrubs, to afford greater facilities for top-dressing with manure or compost, and for loosening the ground to admit the sun and air more freely. The effect of this, however, is not so pleasing as when the turf is continued close up to the plant, and it is besides much more troublesome to keep in order ; and for this reason, as soon as the plants are thoroughly established, and have began to grow freely, the bare ground should be entirely turfed over. In small gardens, it is a common practice to cultivate flowers in and round the shrubbery beds, and (though scarcely in good taste), to make a similar use of the circles round single specimens, rather than allow them to be covered with turf. Where such is the case, some leaf soil should be dug or forked in, to stimulate the plants into vigorous growth ; and, when planting the flowers, a space should be left quite clear between them and the base of the specimen. We have often seen the lower branches of fastigiate trees completely spoiled by neglect on this latter point.

### FLORISTS' FLOWERS.

Pansies are making growth fast, it will be therefore requisite to stop those which are too luxuriant, by pinching out the leading bud. Those cultivated in pots will now require more water, at the same time giving abundance of air, and free exposure at all times, when the weather is favourable. Snails have been more than usually troublesome this season with our plants ; we find no trap so good for the marauders as fresh bran, placed beneath a tile. Polyanthuses are showing in many instances a premature bloom ; earthworms are often extremely injurious to seedling plants, when grown on beds ; they will draw them out of the ground, therefore late planted ones, particularly, must have especial attention. We should much like to see some alteration in the ground colour of these flowers ; to casual observers they present great sameness. We think that by judicious hybridization, much might be done. We have now in bloom in our garden a bright blue Polyanthus ; certainly, it is defective in form, lacing, eye, &c., but why not endeavour to improve this by crossing and seeding, &c. ? At all events, if rotundity were obtained, with a bright lemon eye and lacing, the ground colour would, we think, be desirable ; and we are sure if this plan were persevered in, many interesting hybrids would be obtained. Cover Tulips on appearance of frost, and plant Ranunculuses when the beds are in good order for so doing.

### FORCING DEPARTMENT.

In clear fine weather assist Nature by giving some additional heat to all the Pineries, as well as to the Vineries and Peach-houses, now in operation. This increase, accompanied by a proportional circulation of air, by means of ventilators, will be very beneficial ; but during dull cloudy weather it is advisable to be sparing of artificial heat, for the double purpose of husbanding the energies of the plants and preventing the needless waste of that expensive article fuel. Avoid too moist an atmosphere in the Pineries, or some of the shows will be liable to come without their crowns ; and be very careful in syringing not to allow any moisture to fall upon the flowers. A little neglect on these points, added to a deficient circulation of air, is productive of monstrous crowns, and frequently, deformed fruit. A slight syringing may be given about 3 P.M. to Peaches which are fairly set, but with caution, for much splashing of water at this season is injurious both to roots and branches. Leave a small portion of air on at all times. The Cherry-house, if not already done, should now be put in order for forcing, by having the trees well washed with a mixture of soft soap and sulphur in some warm soft water, in the proportion of half an ounce of each to a pint of water.

### HARDY FRUIT GARDEN.

Gardens are frequently seen crowded with large fruit trees, the greater portion of which is of inferior or worthless varieties, and even the good ones are, from want of proper management, generally unproductive ; besides which their roots exhaust the ground, and their tops shade it, thereby causing injury to the crops of vegetables which are planted near them. This system should be entirely changed ; all inferior varieties should be removed, and of the remaining ones the standards should be drawn down, if they will bear it, and the dwarfs trained as pyramidal or goblet-shaped bushes. If the soil is rich, which may be expected among vegetables, the production of gross and superfluous wood should be prevented by regular and systematic root pruning. An economical arrangement of fruit trees for a kitchen garden is to form rows of pyramidal or goblet-shaped trees on the south side of all walks running east and west, and on both sides of all running south and north. The Gooseberries and Currants should occupy a border by themselves ; and the Raspberries should also have a separate border or compartment, by which means more space would be made available for vegetables. It will be necessary to support the fruit trees with stakes for a few years until properly formed, after which they will support themselves. We mention this now, as all planting of fruit trees should be completed as soon as possible.

### KITCHEN GARDEN.

Draw up ridges of soil on each side of the rows of early Peas which are above ground, in order to protect them from cold sweeping winds ; it will be as well also to put the stakes to them at once, and by using the small spray to fill up the bottom, it will contribute to their more perfect protection. Care must be taken to prevent the ravages of mice and birds ; rats also frequently attack Broad Beans just as they are starting, and if not noticed in time, they will destroy the crop. Broad Beans raised in boxes may be planted out in warm rich soil whenever the weather is mild. In warm situations a sowing of Onions and early Horn Carrots may be made. The Potato Onion is much esteemed by many, and these being early rooting plants and hardy, may be got in with advantage.

State of the Weather near London, for the week ending Feb. 13, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Back Numbers : One shilling will be given for No. 1, 1846.

Fancy Geraniums : *S H H W.* Anais and Queen Victoria will suit you.*

Ferns : *A Correspondent.* The most economical plan of getting a good and large collection of Ferns is to beg or barter for them. The easiest and best is to purchase them of Messrs. Loddiges or others.

Fruit Trees : *Novice.* As you require late Pears for use in Jan., Feb., and March, you should graft your Jargonelle, growing on the south end of a barn, with Winter Nelis, Knight's Monarch, Easter Beurré, and Beurré Rance, and your other trees with March Bergamot and Ne plus Meuris.‖

Fungi : *J F, jun.* The specimen of fungus growing upon an old hollow Willow stump in which Geraniums are planted seems to be a slice of some Polyporus.—*Tis.* The fungus on the Potato is so shrivelled that we do not recognise it. It will not remain examinable while going through the Post-office, unless wrapped in damp paper within the box.

Insects : *W S.* The centipede (or millipede) is the common Julus pulchellus generally found in the roots of decaying vegetables. The small beetle is the Rhyzophagus rufus, generally found under the damp loose bark of trees ; and the small caterpillars may be the species which bores into the corks of wine bottles. *W.*—*D G.* We suppose the leaves of Tropæolum tricolor may be gnawed by woodlice. Place damp moss or slices of Turnips in the angles of the bed, and examine them every morning and destroy the woodlice which will there congregate together. *W.*

Laurels : *Pod.* We never recommend dealers. ‡

Lime : *Questor.* There is no material difference between the two kinds of lime, except that that from oyster shells is the purest.

Mesembryanthemums : *A Lady.* Your cuttings probably had more water than the heat and light, one or other or both, to which they had been exposed would enable them to digest.

Mushrooms : *A B.* Your bed appears to have been properly made, but you have kept it too dry. If you give it a good watering with lukewarm water now, it may possibly produce you a crop yet.‡—*A Y G.* Seven inches in diameter is certainly large for a forced Mushroom.

Names of Plants : *Anon.* 1, Some Crinum, indeterminable from such a specimen ; 2, Rhododendron dauricum ; 3, Andromeda axillaris ; 4, Pyrus Aria.—*D T.* The seed of the common Mango.—*W J.* The Juniper is not in a state for identification ; we, therefore, are unable to answer your inquiry.—*John James.* Acacia conferta.—*T W L.* Clematis balearica.—*R E.* Your specimen is in so withered a state that it is doubtful whether it can be determined. At all events it requires more time than we can possibly spare this week.—*Anon.* Erica herbacea, Clematis balearica.

Orache : *J S and Sons.* No neglect was intended ; but London seemed more convenient for distant correspondents, who probably have agents there.

Orchids : *F D R.* All the species in your list are free flowerers and handsome, nor do any except the Dendrobiums demand unusual heat. For species likely to suit you we must refer you to p. 308 of our last year's volume.

Temperature : *Holkham.* Under inquiry.

Verbenas : *S H H W.* The following six will possibly answer your purpose. Defiance, scarlet ; Mont Blanc, white ; Beauty Supreme, rose ; Imperatrice, Josephine, blue ; Princess Alice, white, with a pink centre ; and Emperor of China, crimson.*

Vines : *A Subscriber.* One Vine for each rafter is quite enough, and preferable to two.‖—*Novice.* We presume you have pruned your Esperione Vine, which you intend to graft ; then all you have to do is to wait till the buds have just burst into leaf, when you may safely graft every spur, or whatever part of the stem you please, without danger of bleeding. ‖

Willow : *Salix.* The Huntingdon Willow is S. Russelliana, we believe. If we are wrong, some correspondent will perhaps correct us.

Misc : *S H H W.* Plants of Campanula carpatica alba may be had of any respectable nurseryman.‡—*P T O.* Prune your Roses now and your evergreens in April. In removing your Pear tree preserve its roots as much as possible. The transplanting will have the effect of sufficiently checking any over luxuriance it may possess.‡

### SEEDLING FLOWERS.

Cinerarias : *R L.* Beautiful in colour, but in its present state a little deficient in shape. It may, however, come better as the season advances.*

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.

EDWARD FURBER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 10*s.* per ton; and for 5 tons or more, 9*l.* 5*s.* per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S, Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

DR. S. NEWINGTON'S PATENT DIBBLES, HAND-HOE CULTIVATORS, DRILLS, and other Agricultural Implements for effecting a more scientific system of cultivation, and insuring more abundant crops. Early orders must be given to ensure early execution. An illustrated Catalogue, &c., may be obtained on application to Messrs. DUFAUR and Co., sole manufacturers, 21, Red-lion-square, London.

FARM TO LET—COUNTY MEATH.

TO BE LET, from the 25th day of March next, the TOWNLAND OF PONDERLOUGH, containing about 198 acres Irish plantation measure, on which stands the Carman's Stage at "The Bush," on the great northern road, within 10 miles of Dublin.

This farm being within two miles of the Dunshaughlin Workhouse, is well situated for the supply of milk to that establishment. The land is also suitable to the growth of Flax and Wheat, and is capable of great improvement in the hands of an industrious, intelligent farmer.

The farm will be let to a tenant willing to employ a proportionate capital in its cultivation, on a lease for such time as may be agreed on, with such conditions as will secure a septennial revision of rent on the market averages, and a full compensation for the increased value at the termination of his occupation. The landlord will also assist in draining such portions of the farm as may be necessary by loan from the Commissioners of the Board of Works.

Application to be made to JOHN MAHER, Esq., Ballinshula, Enniscorthy; FRANCIS MURPHY, Esq., Kilcairn House, Navan; or WM. O'HARA, Esq., 18, Upper Merrion-street, Dublin.—Feb. 15.

NOTICE.

MR. M'INTOSH begs to inform his Friends and the Public, that he has ceased, from the 1st February instant, to edit the HORTICULTURAL DEPARTMENT of the NORTH BRITISH AGRICULTURIST AND JOURNAL OF HORTICULTURE, and has now no further connection with that journal.—Dalkeith Park, February 15.

# The Agricultural Gazette.

*SATURDAY, FEBRUARY* 15, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| WEDNESDAY, Feb. | 19— | Agricultural Society of England. |
| THURSDAY, | — 20— | Agricultural Imp. Soc. of Ireland. |
| WEDNESDAY, | — 26— | Agricultural Society of England. |
| THURSDAY, | — 27— | Agricultural Imp. Soc. of Ireland. |

IT is now notorious to the world that the *Agricultural Gazette* has at command an inexhaustible fund of poultry lore, and that we are ready to distribute our accumulated knowledge at all reasonable applications; but the drafts made by students of this journal on the stores that are known to be contained in its treasury, are sometimes of so incongruous a purport that we are obliged to give them merely fragmentary replies. Any attempt to weave a whole packet of them into a continuous essay would result in something resembling the "very tragical mirth" of that logical poem, the opening stanza of which is,

"BARNY BODKIN broke his nose;
Want of money makes us sad;
Without feet you can't have toes;
Crazy folks are sometimes mad."

A less isolated motto for discourse turns up to-day in the inquiry, "What breed of Fowls are to be recommended for profit to the farmer; and how is he to get them established in his yard?"

Both for appearance and for profit's sake, it is advisable that the farmer should keep to some one breed. To retain several breeds in their purity requires more personal attention, hired labour, and choice of outbuildings, than he can usually afford. It is best managed by such country gentlemen as have three or four lodges to their park, at each one of which a distinct set of fowls may be maintained, and another or two quartered upon the gardener and the gamekeeper, if the former official will submit to be plagued with them. In this way things will go on satisfactorily, especially if the people can be brought to take an interest in their charges, and perhaps to feel a little rivalry as to whose stud is the best managed. A large farmer may often attain the same object by making a like use of the cottages of his work-people. But that is not the thing which *he* requires. Pure chickens may be had from fowls that *usually* live together in miscellaneous socialism, by secluding the intended parents in an airy outbuilding, and rejecting a few of the eggs first laid by each hen. This plan requires constant attention and a pitiless hand to clear off the many good-looking mongrels that will be constantly displaying their new-fashioned charms in the yard. The farmer had better decide to keep *one* pure breed only of cocks and hens.

"Then, Mr. Editor, which do you advise?"

The advice given must be accommodated to what the farmer *wants*. Are eggs greatly in demand in his neighbourhood, and does he wish to be spared the trouble and expense of rearing many young birds? Then let him take some of the non-sitting breeds. At the head of these stand the black Spanish fowls, and their subvariety the Andalusians; next come the Hamburghs, the races that are so idolatrously worshipped in the midland and northern counties, *i.e.* the Bolton bays, the Bolton greys, the silver moonies, and the copper moss fowls, according to the numerous local *aliases* of the four subraces; last in profitableness among the non-sitters, though not in beauty nor in excellence of flesh, are the Polish fowls. But the Spanish fowls are large birds, and consume a good deal; it is true their eggs are of proportionate size and excellence: but, in the market, an egg is an egg; and we believe that greater *numbers* will be obtained, at the same cost of food, by adopting one of the Hamburghs as the established colonist of the farm-yard; and we beg leave to take the Bolton bays, or golden pencilled Hamburghs, by the hand, and introduce them to the favourable consideration of the farmer and his amiable consort. Whichever breed of non-sitting fowls is selected, the *stock* must annually be kept up by sending out eggs to the neighbouring cottages to be hatched, and paying for all reared a certain amount of head-money at an age agreed upon.

If Madame the *Fermière* can see to the rearing of a good many broods, and has three or four rosy-cheeked sons and daughters to assist her in the amusement, besides a boy and a maid to do the heavier work, then let one of the off-incubating breeds be destined to people her barn-door paradise with a philo-progenitive set of inhabitants. She may honour the Dorkings and the Surrey, or the game fowls, or the Cochin Chinas with her preference. There cannot be a better sort for the farmer than the family of Surrey fowls known as the cuckoo fowls. They are somewhat dull and quaker-like in plumage, and inactive in their movements—so much the better; the fowl-stealer cannot spy them out so well in the dusk, and they fatten famously, besides being good layers, sitters, and nurses, and in short possessing every gallinaceous virtue. Game fowls are more beautiful, and are equally good *parents;* their flesh too is delicious, but it wants the weight of the cuckoos, and is apt not to dress so white for market. The cocks, as they get old and jealous, are very prone to kill the other male occupants of the poultry-yard, such as turkeys, guinea-fowl, and even drakes, if they fancy themselves insulted. They are more suited to the lodge, the dog-kennel, the coach-house court, or the cottage ornee, than they are to the farm-yard, to which, when very good, they are apt to give a sort of sporting or even flash look. It must be confessed that they are often birds of great beauty; but the quiet cuckoos are much more business-like.

The Cochin Chinas are as yet more in the hands of wealthy amateurs and exhibitors at poultry shows, than available for farmers as a *main crop* of fowls. The prices asked for specimens that have been cried up by the fancy are, what shall we say? Exorbi—very high indeed. Still we have seen one farm-yard entirely peopled with them; the effect was good, the result stated to be satisfactory. A difficulty in advising the farmer about them lies in there being two or three somewhat different races imported from the East, each asserting that they alone have a right to the title of Cochin Chinas, and that the others are false pretenders, mere bastards, who must yield their claims to the legitimate representative of the house of Cochin China. These disputants have several marks in common, and several merits. They are all excellent for the farmer, if he will but keep his own set pure, though they are a sad bone of contention between breeders, and dealers, and customers, and exhibitors, and those unhappy mortals whom all the rest join in badgering—the judges at the poultry shows; a set of people who ought to think themselves happy if they are spared the compliments lately paid to HAYNAU in London. But, we repeat, each of these competing breeds have their great and not very dissimilar merits; all they want to settle down amicably, is a separate title, which, as the poultry kingdom has no acknowledged sovereign, it is not easy for any dealer or writer to guarantee and ensure, even if he feel justified in conferring it. Each of these varieties have been imported from Shanghae, and each probably from Cochin China and Java. If one sort would be content to be called Cochin China and the other Shanghae fowls, and another Java, if another proves distinct, all would go on smoothly. The breeds would have their claim to favour acknowledged, instead of being in turn depreciated by each other's advocates. In Mr. DIXON's second edition, two are described in an extract from an American correspondent:

"Some say here that the QUEEN of England's fowls came from Shanghae. I will give you some idea of the bloods I have at present. I have two varieties, if not breeds, imported in 1847, direct from the city of Shanghae; the one in the American ship Huntress, the other in the ship Tartar. They differ somewhat from each other; one being almost smooth-legged, the other heavily feathered on the legs. The colours differ; the smooth-legged being all, the cocks some shade of yellow or red, the hens some shade of bay; these weigh—the cocks when grown, 9 lbs.; the hens, 6 or 6½ lbs. [And a most useful and valuable breed they are.] The heavily feathered on the legs differ from the above as to weight; the full-grown cock will weigh 12 lbs., and the hen 8 lbs. As to colour, the cocks come, about one-half of the number, a reddish *Dominique*, the other half red with some black intermingled. Eggs of both kinds very much alike; the colour a reddish yellow, and would weigh from 2½ to 3 oz. each. *J. J. K.*"

Mr. BAILY, of Mount-street, Grosvenor-square, who deservedly stands very high in his trade, has favoured us with *his* description of what the Cochin Chinas ought to be (or what ought to be Cochin Chinas); and he feels sure that he is correct, as he has taken every opportunity and gone to some expense to see the best *imported* fowls, and from those he has formed his judgment.

"The principal features of a pure Cochin China fowl, are a small fine head; red, thin, and skinny face; diminutive, erect, single comb, rising from immediately above the nostril; large body, and very deep from the back downwards; the outer part of the wing concealed by the covering of the breast feathers; the flight of the wing turned in under the middle feathers, and the extremities of them all tucked under the saddle feathers. Scarcely any tail; a few projecting feathers in the hen, and a little tuft turning over like the ostrich in the cock but nothing erect, or sickle fashion, like other cocks; great rotundity behind, composed of *fluffy* feathers; the thighs are also covered with the same, giving them the appearance of great size; the legs are yellow and feathered; more distinctness of anatomical division through the feathers, than in any other fowl."

The farmer and his lady having held a committee, to which, perhaps, the dairy-maid and the bailiff have also been summoned, and having decided what breed of fowl will best fulfil their requirements, must themselves go to market for a cock, and three or four hens of the purest blood, sparing no expense, and applying to a respectable and trustworthy vendor. This is not the place to insert an advertisement; and if it were, we have found the office of recommending buyers and sellers to each other, so thankless, as to be glad to escape it, whenever possible. The same reserve must be maintained here as to prices. The founders of the new population are arrived; they will be provided with some temporary, but very convenient aviary accommodation; and then comes the task, which requires a stern purpose to execute efficiently. Of all the cocks and cockerels on the farm, a merciless Mameluke massacre, or a hopeless transportation for life, must be made *instanter*. Ditto of all the old hens and immature pullets that cannot be warranted to turn their hand cheerfully to the nursing line. By consuming *their* eggs, and making *them* hatch all those produced by the usurpers in the aviary, at the end of the summer the new race will be established, and the nurses themselves must then each be served with a *lettre de cachet*. And in carrying out this exterminating process is often found the stumbling-block, which renders all previous care nugatory, and purity of blood impossible. Miss Mary's dear little hen, or Master Tommy's bantam, or those two or three pretty fowls that the great lady let us have the eggs for, or cook's chicken, that was left her as a legacy by her grandmother, are pleaded for with the earnestness of despair. It is so cruel to make away with *them* darling birds! What harm *can* two or three do? Only four or five, perhaps, at most! Miss Mary cries, Master Tommy sulks, Mamma looks injured and heart-broken, cook gives warning; the farmer cannot stand all this at once; he relents, the bantams knock the cuckoo cocks heels over head, cook's chicken brings out some beautiful cross-breds, and the yard of fowls is spoiled!

## A WORD IN SEASON; OR, HOW THE CORN GROWER MAY YET GROW RICH,

Is the title of a little pamphlet, which I would earnestly recommend to the attention of farmers and landowners. It gives an account of a system of agriculture, attended, as I can bear witness, with extraordinary success; I have had the pleasure of seeing it in practice, and I consider, whether I view it in the light of a tenant farmer, anxious to gain the largest returns at least cost, or of a landowner, desirous to encourage a practice which shall permanently improve the soil, I have never inspected any cultivation more deserving of attention.

I am not going to give the author credit for novelty, for Jethro Tull advocated the principle 100 years ago, and the advantages to be gained from deep culture have been well shown by others; nor am I wishing to bring forward the practice there laid down as the one best suited for farmers' adoption. All I wish to do is, to draw attention to the advantages gained from deep cultivation and frequent moving of the soil, for my own experience in farming has taught me to look with distrust at the pains many are taking to impress upon arable farmers the necessity for placing their chief dependance on stock keeping, to give them the means to profitably grow corn, for I have ever found the losses from stock kept upon the produce of arable land, largely interfered with the profits from cultivation; and as I, too, have experienced, and on a large scale of farming, how much the occasion for manure to grow corn may be lessened by deep and good cultivation, and how much larger my profits grew as my occasion for manure became less, I introduce with much pleasure the work to your readers.

To give the confidence which is so much wanting on introducing new systems, I begin with drawing attention to the author's very satisfactory balance-sheet, showing the cost of growing an acre of Wheat, with the return which he has obtained from land where he has grown Wheat, without manure, for five successive years, the return given being the last year's:—

THE OUTLAY.

| | | | |
|---|---|---|---|
| One double-digging of the fallow ground, being two feet of every five feet ... ... ... ... | £ | 1 | 10 | 0 |
| Two single forkings ... ... ... ... ... | | 1 | 0 | 0 |
| Pressing, sowing, hoeing, carrying, threshing, and rates ... ... ... ... ... ... | | 2 | 1 | 0 |
| Seed, two pecks ... ... ... ... ... ... | | 0 | 2 | 6 |
| | £ | 4 | 13 | 6 |

RETURN.

| | | | |
|---|---|---|---|
| Wheat, 4 quarters 2 bushels, at 40s. ... ... | £ | 8 | 10 | 0 |
| Straw, 1 ton 12 cwt., at 40s. ... ... ... ... | | 3 | 4 | 0 |
| | £ | 11 | 14 | 0 |

Now, if we add to the charges 40s. an acre to cover rent and interest of capital, and 40s. an acre more for provision for contingencies and dressing (for I would not encourage the idea that land can be farmed for ever without dressing), a net profit of 3*l.* 0s. 6*d.* per acre, per annum, remains; and this is gained by cultivation, which permanently deepens the staple of the land.

The practice which has given this extraordinary return is as follows:—The ground is laid out in stetches of five feet, each of which is thus appropriated—one-half is given to growing three rows of Wheat, at intervals of one foot. The other half is left to admit of being worked as follows: as soon as the young Wheat shows, this part is trenched two feet deep, and to within six inches of the young Wheat. The top soil being placed undermost and the bottom uppermost. In this state the wide intervals lie all the winter exposed to the action of frost and atmospheric changes, which are so beneficial to newly turned-up earth. In the spring, this space is again turned over with the fork one spit deep, and has the cultivator run through it as often as the incrustation of the surface calls for it. In this period, so long as the growth permits, the young Wheat receives several horse hoeings. As soon as the Wheat is harvested, the fallowed space is again turned over with the fork, and levelled, and channels are made by a three-wheel presser to receive the seed, which is carefully dropped, grain by grain, three inches apart, at the rate of two pecks per acre. In this way upwards of four quarters of Wheat have been grown from the same land, and without manure, for five successive years. By this simple process, with nothing beyond the use of a simple cultivator, the spade, the fork, and the presser, has the same acre of land been made to pay back so bountifully for the farmer's labour; the fertility has been gained from the decomposing action of heat and cold, wet and drought, wind and rain upon the well tilled intervals, which, at the same time, has been gathering the treasures of nitrogen, ammonia, and decomposed organic matter, the descending rains carry into the substrata made pervious by the deep tillage. When we reflect on the identity of the constituent of grain, with the matter afforded by decomposed soils, or supplied from water and the atmosphere, it will not appear surprising after this wintering and summering under deep and constant exposure, that the teeming earth should so soon be ready to receive the seed; but I must not trespass further. The little book may be had of James Ridgway, Piccadilly, and the farming may be seen by application to the Rev. S. Smith Lois, Weedon, near Towcester, Northamptonshire. There can be no doubting of the practice or the return, for it is in any one's power to see the former, and, as to the latter, I privately saw the farmer in whose barn the corn was threshed, and who assisted to measure it; and unwilling as farmers generally are to admit of facts that tell against their own practice, he neither questioned the accuracy of the labour, nor the returns, nor disputed the advantages; but simply, and with astonishment, told me "he knew it was all true." There is a recommendation of this plan of farming which I must not omit to allude to, for in this appears one of its greatest merits to the very worthy gentleman who has taken such pains to spread the practice. The hand labour it calls for would give employment to our rural population through the winter; and knowing how desirable is this, and how readily the system may be applied to small holdings, the little capital it calls for, and its simplicity, I hope many others will follow the example of Mr. Smith; and with Jethro Tull in hand, and Mr. Smith's practice in their eye, will establish their example farms, and become teachers of truths which as yet are unknown to some of the honourable members of the Royal Agricultural Society. *Hewitt Davis, 3, Frederick's-place, Old Jewry, London.*

## Home Correspondence.

*Quality of Hides.*—The observations of the correspondent of the *Morning Chronicle*, which you quote in last week's *Gazette*, can only excite ridicule in the minds of a tanner or currier. As a practical currier of 20 years' experience, I can without hesitation confirm your general view of the question. The matter may be of small importance to the farmer, for though an advance of 30 per cent. has taken place in hides, no portion of it has found its way into his pocket; but, where such absurd and careless statements are made, it is desirable that they should be exposed, that the public may receive with caution similar announcements. The statement that "if an animal has been forced (I presume highly fed), it will be unequal, thick in the butt and thin in the shoulder," is directly the opposite of the fact. Every tanner or currier, who has the misfortune to come into the possession of the hide of a prize beast, knows it is as deficient in substance as in quality. I have now in stock a hide from one of Prince Albert's prize animals, and there is not a piece of thick leather in it. This hide, like most of a similar character, disproves your statement, that hides are "pretty equally greased throughout;" a portion near the tail (at least a superficial yard) is rendered comparatively worthless by saturation with fat. I have not unfrequently been able to squeeze out the grease from such hides after tanning; and where this is the case, no length of time or strength of liquor will enable a tanner to convert such material into good leather. I think also, with great submission to your authority, that the distension of the hide by full feeding does diminish the substance. Your suggestion, that the animal, by turning his tail to the storm, thickens the hide in the butt, is an ingenious mode of accounting for what is certainly a physiological fact; for all my experience confirms your opinion that the hides of such animals are the most irregular in substance. A thin, bad shoulder is the usual characteristic of the skin or hide of an ill-conditioned animal. In the breed, however, we find the greatest influence upon the pelt; and the change which has taken place in this particular has almost revolutionised the trade. In this county, for instance, where the old long-horns almost exclusively prevailed, we had the best hides in England for substance; and I have heard my father say that they had at one time great difficulty in supplying thin leather. Now it is completely reversed. The best hides, as proved by current prices, are from the West of England. Climate also appears to have much influence: the Cornish hides are of the finest grain, in some cases being hardly inferior to calf-skins in texture; French hides have the same superiority, and, in comparison with the inferior Welsh and Irish, are not more dissimilar in character than the beasts which produce them. I must apologise for the length of these observations, which I have endeavoured to limit to that part of the question which interests your readers. *J. S. Whitten, Coundon, near Coventry, Feb. 6.*

*The Labourers in Agricultural Districts* deserve the sympathy of the public on many accounts, and certainly their patience under poverty and hard fare is not one of their least virtues. The idea of striking out any plan which may generally improve their condition is one which cannot be carried out, so much depends upon the locality in which they reside, and the masters for whom they either work or should work. The formation of a society for the purpose of finding profitable employment for the poor might be attended with advantage, if properly organised, in every parish, but is met by the objection that a company not looking for gain would undersell the farmer and gardener, and thus injure a class already reduced to the lowest scale of emolument to be obtained from the cultivation of land. So far from damaging the interests of the farmer, a society of the above description would relieve the rates from a number of able-bodied paupers who are now provided for without making any return to the public purse. Men are disinclined to lay out money unless they can touch a sure per centage for time, trouble, and capital expended; they are not satisfied with an indirect benefit proceeding from their exertions. Would it not be better for an individual, in tolerably comfortable circumstances, to expend 10*l.* in labour on his property, although he could only anticipate receiving back again the same sum, without interest, than paying one-half the amount in rates, encouraging idleness, and losing his money? This is no imaginary case, but one of daily occurrence, and may truly come under the old saying, "Penny wise and pound foolish." Suppose that in making work for the labourer a portion of the money expended should not return to the master, yet he would be a gainer by promoting industrious habits amongst the poor, and rendering them independent of the Union, which takes so much out of the agriculturist's pocket, because he will not consult his own interest, and keep the collector from his door, by thoroughly cultivating his land; but whilst advocating the cause of the husbandman, it must be confessed great disappointment is too often experienced by those anxious to improve the condition of their neighbours, by a disinclination on the part of the labourer to do justice to his employer, scrambling over his task, and caring little how it is executed, if not well looked after. This may be, and no doubt is, in a great measure the fault of early education, and the want of proper management on the part of the parents, and the great want of occupation for lads after they leave school. Nothing tends more to diminish crime than an abundance of employment, which the statistics of the country will verify. The value of spade husbandry having been proved, particularly upon clay lands, why should it not be practised to a great extent, as, after all, the expense of digging 15 inches deep is not greater than ploughing 6 inches with a dressing of manure, and the former will, if turned up in time, bear the heaviest crop. Farmers may have some difficulty in collecting a sufficient number of men to dig their land, when they require a few acres prepared for root crops, and may not have time personally to attend to the work. This might be obviated by establishing gangs with a responsible headman to contract for the job at so much per acre, a certain depth of soil being moved. It is almost impossible to lay down decided rules applicable to all localities, but general hints may be given which may induce men of influence to exert themselves in promoting the welfare of the labouring classes, although it may cause more trouble than profit—the latter appearing in the conduct of the men, making them more respectable and trustworthy, in proportion to the interest evinced towards them by their superiors in wealth and position. *Falcon.*

*Smithfield Market.*—Human beings living in large towns are too much absorbed in business, or pleasure, to think about anything which does not immediately touch upon their particular occupations or fancies—hence few trouble themselves to inquire from whence the food comes, or what misery the animals may endure before the joints are placed on their tables. Of course it would not answer any good purpose, if the exit of every sheep and ox was lamented over; they were created to serve as food for man, and their ignorance of this fact renders their lives happy, provided they are treated with common humanity. It would not require any great research to prove that it is more expensive to torture brutes than to use them kindly. However, it appears the contrary is attempted to be proved, by the strenuous exertions made to continue Smithfield market. Surely the public must be permitted to have a voice on this important point, and one of such vital interest to all classes, more particularly to those whose purses will not allow them to purchase meat from first-class butchers. Do those who sit down to the sirloin and haunch ever picture to themselves the unnecessary misery the ox and the sheep endured, before they supplied the smoking dishes? or how many of their companions, belonging to the same flocks, were, by ill usage, rendered only fit (or rather unfit) for the sausage and preserved meat manufactories? Supposing Smithfield could be enlarged so as to give an extra inch to unfortunate bullocks, it cannot be increased in area, as the people multiply; and if twenty acres could be added to-morrow, a few years would make the nuisance more intolerable than ever, by congregating a greater number of quadrupeds in the centre of the metropolis, without the possibility of again stretching the market, independent of the injury to the health of the inhabitants of London, which loudly calls for its extermination. The short time it can last, even if doubled in size, ought to induce those who advocate the continuance of Smithfield to change their opinions, for the sake of persons who may be inclined to expend money, on what must one day become extinct, and sooner than most people anticipate, in spite of all improvements. London, with two millions of inhabitants, should have four capacious abattoirs, after the French plan, where animals should be slaughtered and carried through the streets as beef and mutton, instead of goaded and hunted through the thoroughfares as oxen and sheep, maddened by fever, and their corrupt carcases sold to feed our fellow-creatures, propagating disease and death to a fearful extent. Should any one doubt the result of eating unhealthy meat, let him for one day try the experiment, and he will then feel convinced of the awful consequences that must follow where people are in the habit of partaking of this disgusting and dangerous food. Perhaps some farmer who is in the habit of supplying Smithfield market with live stock would be kind enough to furnish a history of twelve months' experience of the advantages and disadvantages of sending his animals into a crowded space in the heart of the metropolis. The opinions of men who can relate facts on their own knowledge, having probably suffered in their pockets, will be worth all the anonymous statements that can be collected. Let salesmen point out the losses sustained by the present system, and the public voice may then compel an influential press to treat the subject with a full determination of extinguishing the nuisance. Or are we to wait till a few more lives are sacrificed, and the mortality increased, the former by the horns and hoofs of infuriated bullocks, and the latter by the unwholesome carcases, disguised, and devoured by the poorer classes? The idea of increasing the sanatory condition of London, by draining, and at the same time feeding the people on bad provisions is odd. *Falcon.*

## Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held at the Society's House, in Hanover-square, on Wednesday last, the 12th of February; present, Mr. PUSEY, M.P., trustee, in the chair; Lord Ashburton, Hon. Dudley Pelham, M.P., Right Hon. Sir James R. G. Graham, Bart., M.P., Right Hon. Thomas Francis Kennedy, Sir Thomas Dyke Acland, Bart, M.P., Sir Thomas Tancred, Bart., Sir

Robert Price, Bart., M.P., Mr. Alcock, M.P., Mr. Raymond Barker, Mr. Bramston, M.P., Mr. Burke, Mr. D. Burton, jun., Dr. Calvert, Mr. Pole Carew, Colonel Challoner, Mr. Christopher, M.P., Mr. Clavering, Mr. Commerell, Mr. Layton Cooke, Mr. Dyer, Mr. T. B. Evans, Mr. Foley, M.P., Mr. R. Fox, Mr. Fuller, M.P., Mr. Brandreth Gibbs, Mr. Leveson Gower, Mr. Hamond, Mr. Fisher Hobbs, Mr. Jacson, Mr. Langston, M.P., Mr. W. Long, Mr. Maddison, Mr. Magendie, Mr. Marshall, M.P., Mr. Wykeham Martin, Mr. Miles, M.P. (Leigh Court), Mr. W. Mundy, Mr. Ralph Neville, M.P., Mr. C. E. Overman, Mr. Paynter, Mr. Pendarves, M.P., Mr. C. Pocock, Mr. D. Pugh, M.P., Captain Rushout, M.P., Professor Sewell, Mr. Villiers Shelley, Professor Simonds, Mr. Slaney, M.P., Mr. Augustus Smith, Mr. Stansfield, M.P., Mr. H. Strafford, Mr. Spencer Trower, Professor Way, Mr. Wilson (Stowlangtoft), and Mr. Wrightson, M.P. Among the distinguished visitors present (not being members of the Society), were Sir George Grant Suttie, Bart., Mr. Macartney, LL.D., Vice-President of the Flax Society of Ireland, Dr. Cooke, Professor of Chemistry and Mineralogy in Harvard College, America, Dr. Ryan, and Mr. George Hoare.

The following new members were elected :

Marjoribanks, Edward, Fawley Court, Henley-on-Thames
Bell, Matthew (High Sheriff for the county of Kent), Bourne Park, Canterbury
Rixon, Wm. Augustus, jun., Carshalton, Surrey
Ainslie, Rev. Robert, Tromer Lodge, Down, Kent
Taylor, John, Burnfoot House, Wigton, Cumberland
Reynolds, James, Lea-bridge-road, Leyton, Essex
Hamilton, William, Orchard Place, Canterbury
Browning, Edward, Bulmer Kitchen Farm, Sudbury, Suffolk
Dennis, John Charles, Rosebrough, Alnwick, Northumb.
Borton, John Barton-le-Street, Malton, Yorkshire
Carden, Captain, 13, Cumberland-terrace, Regent's Park
Kinglake Arthur, (banker), Taunton, Somersetshire
Searby, John, Foith Bank, Boston, Lincolnshire
Sandford, Mark, jun., Martin, Dover
Bramley, Charles, Westville, New Bolingbroke, Lincolnshire
Rayer, William Carew, Tidcombe, Tiverton, Devon
Morgan, Thomas, Maesgwrda, Laugharne, Carmarthenshire
Cornes, James, Barbridge, Nantwich, Cheshire
Maybery, Rev. Charles, Rector of Penderyn, Brecon
Hulton, James Dott, Islington-hall, Lynn, Norfolk
Stephens, John, Wilton, Taunton, Somersetshire
Howell, Francis, Ethy, Lostwithiel, Cornwall
Trevelyan, Sir Walter Calverley, Bart., Nettlecombe, Taunton
Wilson, Stephen, Boakfield, Ballitore, Ireland
Bland, Nathaniel, Leathernead, Surrey
Langton, Capt. Edward Gore, Stapleton-park, Bristol
Toplis, James, Bernard-street, Russell-square
Peel, Lawrence Henry, Llanstephan, Radnorshire
Sharpe, William, Copthall, Epsom, Surrey
Savery, A. B., Hardwick-lodge, Chepstow, Monmouthshire
Chapman, James, Tontine-street, Folkestone, Kent
Jackson, Thomas, Eltham-park, Kent
Mangles, George, Givendale-grange, Ripon, Yorkshire
Serrell, Sheffield, Leeson-house, Swanage, Dorsetshire
Carnegie, W. F. L., of Boysarth, Kinblethmont-house, Arbroath, Forfarshire
Evans, George, Wimborne, Dorsetshire
Hood, Alexander Acland, St. Audries, Bicknoller, Taunton
Webber, Henry, Park-hall, Bromsgrove, Worcestershire
Dunn, Thomas, York-gate, Regent's park, London
Orde, Sir John Powlett, Bart., Kilmorey, Lochgilphead, Argyleshire
Firmin, Harcourt, Stratford-hills, Colchester, Essex
Campbell, Alexander, Achindarrock, Argyleshire
Walker, Lawrence, 46, Welbeck-street, London
Newton, Robert Pillans, Halyburton, Coupar-Angus, Fifeshire
Broadmead, Philip, Milverton, Somersetshire
Thompson, Frederick, Sheriff-Hutton Park, York
Balmer, Thomas, jun., Goodwood, Chichester
Dearsley, Henry Richard, 3, Plowden-buildings, Temple
Yeoman, Thomas Lawrence, Richmond, Yorkshire
Lewis, Rt. Hon. Sir Thomas Frankland, Bt., Hampton-court, Herefordshire
Sergeaantson, George John, Camp-hill, Ripon, Yorkshire
Prosser, Francis Wegg, M.P., Belmont, Herefordshire
Baxter, Henry John, Brook-lodge, Cheadle, Cheshire

The names of seven candidates for election at the next meeting were then read.

FLAX-COTTON.—The CHAIRMAN informed the Council, that in consequence of the great interest, in a national point of view, attached to the recent discoveries of M. Claussen in rendering Flax subservient to the purposes of cotton, and the importance to the farmers of this country of every fact affecting the cultivation of Flax ; he had requested that gentleman to favour them with his attendance on that occasion, in order that he might explain to those members present his views on the subject of the increased demand that might possibly arise for the article of Flax by the British manufacturer, in consequence of the facilities offered by his new process, for adopting it to purposes of a more general character, and the greater attention the Flax crop would deserve on the part of the agricultural community, reserving to a further meeting the opportunity of detailing to the Council the chemical and mechanical processes by which Flax is converted into a substance possessing for manufacturing purposes all the properties of foreign cotton. The Chairman hoped that this discovery, if found to be equal to the expectation formed of it, might, perhaps, constitute a new bond of union between the farmer and the manufacturer of this country. He need scarcely add the caution, that the Council were not responsible for the opinions which might be laid before them on this subject, as their own rule, like that of other similar bodies, guarded them from any danger of misapprehension on that point. The statement of M. Claussen would rest on its own merits, or otherwise ; and they were obliged to that gentleman for favouring them with his views on the subject, at their first weekly Council of the session, and previously to the final enrolment of his specifications.

The Chevalier CLAUSSEN, attended by Mr. Edward M'Dermott, Mr. J. S. Christopher, of Gresham-street, Mr. Thomas Graves, Dr. Ryan, and Mr. C. J. Pownall, were then introduced to the Council, when M. Claussen stated that as he feared he should not be able to make himself sufficiently intelligible in English, he had requested his friend, Mr. M'Dermott, to draw up a paper on the general question of the cultivation of Flax, which, with the permission of the Council, that gentleman would read ; after which, he and other of his friends would be happy to afford the Council such information, as to his process, as the circumstance of his not having finally enrolled his specification would be prudent for him to state. Mr. M'Dermott then read the following paper :

## REASONS IN FAVOUR OF AN EXTENDED CULTIVATION OF FLAX AND HEMP IN THE UNITED KINGDOM.

My object, gentlemen, in reading the present paper, at the request of your esteemed Chairman, is to submit to you, and through you, to the great agricultural body of England, a few facts bearing on the importance and advantage which, in a national and individual point of view, would result from a more extensive cultivation of fibrous plants in this country. In venturing humbly to submit these facts and opinions to so important and influential a body of gentlemen as those who compose the Council of the Royal Agricultural Society, I am far from wishing it to be understood either that I conceive them to be ignorant of many of the facts which I shall have occasion to adduce, or that the subject of Flax culture is one to which they have not already paid some considerable attention. On the contrary, many of the valuable reports of your Society, and the prizes given for Essays on the subject, prove that it has at various times engrossed your consideration, and formed the theme of serious deliberation at your Councils. Market's comparatively undeveloped ; ignorance of the true character and structure of the plant ; prevalence of modes of cultivation and preparation of the fibre, wasteful and injurious in themselves, and attended with an enormous amount of risk and trouble to the grower, have, hitherto each had their weight in inducing your Society to withhold its valuable recommendation in favour of an extension of Flax culture.

The progress of science, and the skill and enterprise displayed by many of the agriculturists of England and of Ireland, have, however, now placed the matter upon a perfectly different footing, and upon one which I venture to submit should induce the Royal Agricultural Society, in the most strenuous manner, to urge upon the farmers of the United Kingdom the propriety of immediately devoting some portion of their land to the cultivation of Flax.

CLIMATE AND SOIL OF ENGLAND SUITED TO ITS GROWTH.—That Flax *can* be produced in this country is a point upon which I apprehend little doubt now exists ; and it is unnecessary for me, especially before such a body as that which I have now the honour of addressing, to argue such a question. Suffice it, therefore, upon this point, to say, that in many respects our climate is better adapted for its growth than even Belgium, inasmuch as we are not subject to those severe droughts which, occurring in the spring, in that country, frequently inflict very serious damage upon the young crop. Flax is grown, to some extent, in almost every part of the United Kingdom—it has been grown with success upon an Irish bog, and in the fen districts of England—on the summit of the Wicklow mountains, and upon the Beacon-hill of Norfolk, in the midland counties of England and the western shores of Galway and Mayo, upon rich and poor, clayey, gravelly, alluvial, and every variety of soil.

IMPORTANCE ATTACHED TO GROWTH OF FLAX BY GOVERNMENTS.—This suitability of our climate and soil, to the production of Flax, and the importance which in earlier times was attached to it, is sufficiently evidenced by the numerous legislative measures which at various times, from the reign of Henry VIII. to that of George III., have been passed in order to promote and encourage its growth. The "Transactions of the Board of Agriculture" for 1742, contain a letter, written by Robert Somerville, Esq., of the East Lothians, in which the writer regrets, notwithstanding these encouragements and the bounties offered by the liberality of the Government, that the cultivation of Flax should then have been so extremely limited, and the management in every stage, both of its culture and manufacture, so very defective.

"This," he says, "is the more to be regretted, as there can be little doubt that immense quantities might be raised in Britain with little labour, and that, too, upon soils where hardly anything else will grow. The accomplishment of an object so truly desirable as that of the extended cultivation of Flax, would be attended with the most salutary effects, by affording employment for an increased population, and materially lessening *our dependence upon foreign countries.*"

But if, upwards of a century since, great importance was attached to this subject, on the ground of *increased population and dependence on foreign countries*, of how much greater importance and advantage ought it not to be considered at a time when our population is more than doubled, and our *consumption of cattle food*, formed from Flax seed, and of raw material for our manufactures, have increased to an extent which, a *century* since, would have been considered fabulous and incredible ; and at a time, too, when our railways and improved means of transit give such increased facilities to the grower for the disposal of his produce.

MARKETS.—In urging upon the agriculturists of England the propriety of an extended cultivation of Flax, I am anxious first to show them the enormous extent of the *existing markets* for their produce, which is now almost exclusively engrossed by the foreign producer ; and the vast demand which is now opening up, in consequence of the recent discovery by which Flax may be employed in our silk, woollen, and cotton manufactures ; and which, if not speedily secured by our home producer, must in like manner, be supplied by the foreign grower. The markets which at *present* exist for Flax are twofold in their character—agricultural and manufacturing. Under the former are comprised those large quantities of oil-cake, and of Flax seed for sowing and crushing purposes, which are annually consumed in this country.

OIL-CAKE.—Upwards of 70,000 tons of oil-cake are annually imported, the value of which exceeds 500,000*l.* The whole of which might be produced by our agriculturists with the most perfect ease, and with profit and advantage to themselves. In connexion with our supply of foreign oil-cake, it is worthy of remark, that by far the larger proportions are sent from those countries which are the largest exporters of cattle to this country. By the almost total neglect of the cultivation of Flax our farmers are thus placed in the anomalous position of *dependence upon those countries* for the supply of food for their cattle, which compete with them in our markets, and in several instances we are actually compelled, in addition to the price set upon the cake, to pay a considerable duty imposed by the Government of the exporting countries.

FLAX-SEED FOR CRUSHING.—From *Russia* we import annually half a million of quarters of Flax-seed, the value of which is upwards of a million sterling. Our total imports of Flax-seed for sowing and crushing, from all countries, in round numbers, is about 650,000 quarters, the value of which, at the low price of 7*s.* per bushel, is 1,820,000*l.* There is no reason whatever why this large sum might not be annually saved to the pockets of our agriculturists, nor why the makers of linseed oil should not be supplied exclusively with home grown seed for the purposes of their manufacture. The cultivation of Flax at home, *if only for the seed*, would render our oil-pressers independent for their supply upon foreign countries, and would give to our agriculturists a return of upwards of 2,000 000*l.* annually. It would also give them an article more valuable for cattle food than the oil-cake purchased from foreign countries, and which consists of the mere refuse and husks which remain after the expression of the oleaginous properties from the seed ; or if it should be preferred by some still to use cake, the seed could be sold to the "oil-presser," and the grower might fatten his cattle upon cake produced from home-grown instead of from foreign Linseed.

SOWING SEED.—With an increased cultivation of Flax at home, we should also be spared the dependence upon foreign countries for our supply of seed for sowing purposes, and which we now import to the value of some 200,000*l.* per annum ; for it is absurd to suppose that flax can only be grown in this country from foreign seed. The reason for this opinion being no doubt traceable to the prevalent mode of pulling the Flax before fully ripe.

MANUFACTURES.—Passing on, however, from the agricultural demand which exists for the production of the crop in the shape of *seed*, I will now call your attention to the existing market and the sources of supply for the *fibre* of the plant required in our manufactures. It cannot fail to be a matter of deep regret to every well-wisher of his country, that in the two main branches of our textile manufactures we are so completely dependant for the supply of the raw material upon foreign countries. Our cotton manufactures, absorb, *daily one thousand tons* of cotton wool, the produce of foreign countries alone. For our supply of cotton, we must, no doubt, still continue to be dependant upon foreign countries, inasmuch as the material cannot be produced *at home* ; but there is every reason to believe, that by the adaptation of Flax to cotton machinery, this extent of dependence will in future be considerably less than it has hitherto been, provided our agriculturists will but come forward in earnest and endeavour to supply the new demand for their produce thus created. Our linen and other manufactures in which Flax is employed, are all but completely dependant upon foreign countries for their supply, and of the 100,000 tons now annually consumed, not more than one-fourth is produced in this country. The total value of the Flax fibre imported for manufacturing into linen, sail cloths, tarpaulings, rick covers, sacking, and other materials, exceeds 5,000,000*l.* annually ; and there is no doubt, judging from the rapid progress of our linen manufacturers, that if the supply of the raw material could be more readily obtained at home, the consumption would be increased to a still greater extent. The progress of the linen trade, in consequence of the great improvements which have been made in machinery, has within the last 20 years been almost unparalleled. The exports of linen have increased since that time from 50,000,000 to 105,000,000 of yards, and its declared value from 1,700,000*l.* to upwards of 3,000,000*l.* No attempt whatever has been made on the part of our agriculturists to meet this enormous and rapid increase in the demand for the raw material ; and as a consequence, the foreign producer has been reaping a golden harvest from the monopoly which he has possessed. The imports of foreign Flax have increased from 936,000 cwts. in 1831 to 1,800,000 cwts. in 1842. The value of the *increased* imports being not less than *two millions and a half*, nearly the whole of which is paid for in money sent out of the country.

HEMP.—We also import large quantities of Hemp, which might, like Flax, be easily and profitably grown at home. The value of the Hemp annually imported is about 1,500,000*l.* We have thus a demand existing for Flax and Hemp, and for the supply of which we are dependant upon foreign countries, shown in round numbers, by the following figures :

| | |
|---|---|
| Flax fibre | £5,000,000 |
| Seed for crushing | 1,800,000 |
| ——— sowing | 200,000 |
| ——— Oil-cake | 600,000 |
| ——— Hemp | 1,500 000 |
| | £8,800,000 |

NEW MARKETS.—Hitherto I have spoken only of the *existing markets*. I am now anxious to call your attention to that great demand which will be opened up by my discovery of the mode of adapting flax to cotton and woollen machinery. The substitution of flax for cotton is now no longer a matter of doubt. Recent experiments at Rochdale have completely set that question at rest. Important as may be the considerations connected with the present linen manufactures, and cogent as may be the arguments deduced from them, in order to induce you to obtain possession of the ground now occupied by the foreign producer—infinitely more important, and far more forcible, are those which may be drawn from the prospective demand now springing up in our cotton manufactures. The consumption of the raw material must of necessity be governed by the machinery which exists for its manufacture, and the spindles of Belfast, of Dundee, and of Leeds, are already supplied with the produce of foreign countries. Not so, however, with respect to flax and its adaptation to the cotton manufactures. Millions of cotton spindles are ready at once to take to the new material and spin it for you, without the slightest alteration being required in their arrangement. A thousand tons of cotton daily, or 770,000,000 of lbs. annually are consumed in our cotton manufactures, and the result of my recent experiments has been such as to show that flax may be substituted for one-half at least of this amount. In order, therefore, to supply the *new demand* for a *new material* thus created, the produce of 2000 acres will be required for each day, and the whole of the Flax grown in the United Kingdom does not amount to more than one-seventh of the supply required for Manchester alone. It is a duty imperative upon the agriculturists of the country to endeavour to meet this enormous demand, and not to allow it to pass into the hands of foreign countries, which will inevitably be the case, if they do not immediately exert themselves in this respect.

WOOL.—But not Manchester alone, but the woollen districts of England await with anxiety an increased supply of Flax which shall be available for the purpose of spinning in combination with wool, upon the existing wool machinery. I will not trouble you with statistics upon the subject of our woollen manufactures. The population of Leeds, Bradford, and other towns in the woollen districts, are kept in a state of prosperity by the employment which it affords ; and the introduction of Flax into that particular branch of our manufactures would have the effect of reducing the price of the material by 25 per cent., and of giving an increased amount of employment in those districts. A firm in Bradford has already taken steps to carry on the manufacture, and will alone require the produce of 5000 acres in the ensuing year.

DEFICIENT SUPPLY OF COTTON.—In connection with the supply of the markets already referred to, a further argument is to be found in the fact of the present diminished supply of the raw material from foreign countries. "There is," says Mr. Porter, in his remarks on the statistics of the cotton trade, in a paper read before the British Association last year, "a growing opinion that now, and for some years past, we have reached the maximum supply of cotton from the United States—a fact which, should it prove to be correct, makes it a matter of absolute necessity, either to seek for further supplies of the article from other sources, or to find some efficient substitute that shall provide the means of employment for our continually growing numbers." So great has been the deficiency of cotton in the United States during the past year, that the prices have risen cent. per cent. as compared with those of 1849, and our manufacturers are straining every nerve to endeavour to obtain an additional supply of cotton, and to reduce their dependence upon the United States for the supply of their staple article. The Manchester Chamber of Commerce, feeling the importance of the subject, have at considerable expense, sent a gentleman to India for the purpose of obtaining information as to the probable extent to which they might depend upon that country for an increased supply of cotton. But to realise this much desired benefit there must be introduced into India a totally new system of managing the crop,

and new and convenient modes of transit for bringing the produce of the interior down to the coast for shipment. Those acquainted with the habits and prejudices of the people of that country need hardly to be told with what difficulty such a change would be brought about, and how many years must elapse before the establishment of railways, or the formation of roads for the conveyance of the material produced under such an altered system. So far, then, as the arguments for an extended growth of Flax in this country, founded upon the present position of our cotton manufactures are concerned, our agriculturists have to consider the diminished supply and increased price of cotton; the difficulty of obtaining the requisite supplies from other countries; and above all, the fact that Flax can be advantageously employed as a substitute in those manufactures in which cotton is required.

Deficiency of Flax.—If again we turn to the position of our linen manufactures, it will be found that there exists in that branch also a most extraordinary deficiency in the supply of the raw material. In Ireland the cultivation of Flax has fallen off during the past year, as compared with 1845, by nearly 60,000 acres. In Russia, from whence we derive our largest supplies, there has been a decrease in the amount of exports of Flax of nearly 150,000 "poods," or about 20 per cent.; and I find in the *Morning Chronicle*, which has devoted much attention to the subject of an extension of the growth of Flax, a circular of one of the largest houses in St. Petersburgh, in which the following statement occurs:

"We are to have a small supply of Flax next season, *not above one-half* of that which we had two years ago, and such high prices are consequently paying in the interior, that the dealers will not be able to lay it down here, to cost less aboard, than it is now selling for on your side; so that we are not likely to have anything doing on contract for a long time, if at all this winter, unless the relative state of the two markets experience mutual alteration by an improvement on your side."

In Belgium, where the finest qualities of Flax are produced, the cultivation of Flax is considerably less than on the average of former years.

It is under these circumstances, with an increasing demand on the part of the manufacturers, and a diminished supply on the part of the foreign producer, that I venture to submit to the British agriculturist the taking some steps calculated to meet the existing state of things, to diminish our dependence upon foreign countries, and by so doing confer lasting benefits, both upon himself and upon his country. There is a happy conjuncture with this state of things and the time at which the present demand arises. Formerly, when our laws imposed restrictions upon the importation of grain for human food, our agriculturists might have conceived that there existed some kind of moral impediment in the way of increasing our home growth of articles for any purpose not of equal primary necessity. That impediment, whether rightly or wrongly I pronounce no opinion, has, however, passed away, and there is now no reason whatever why their fields should not henceforth be used for the production of any article that promises an adequate profit to the grower.

"It is," says Mr. Porter, of the Board of Trade, "especially desirable so to apply the productive power of the soil for the supply of articles *as indispensable* to the support of millions of our people as corn itself; and an *additional inducement* to the growth of Flax, beyond that offered by other articles, may be found in the fact that, to bring it to the same condition as that in which it is imported from foreign countries, calls for the employment of a considerable amount of human labour."

Objections to Growth of Flax: Agriculture—But, if satisfied that ample markets exist for the sale of his produce, and that this sort of moral impediment to its growth has been removed, the agriculturist may still point to the objections entertained against the growth of Flax, both on account of its supposed exhaustive character, and the trouble, risk, and expense attendant upon its preparation for markets, as reasons why he should not enter upon the cultivation of the plant. With respect to the exhaustive character of the plant, and its consequent injurious effects upon the soil, there appears to be no reason for supposing that, under a proper and judicious mode of treatment, it is more exhaustive or injurious than any other seed-producing crop. An examination of the stem of the plant shows that those portions of it which are required for the purpose of manufacture, are derived almost exclusively from the atmosphere. Indeed to so small an extent do the inorganic properties of the soil enter into the fibre, that it has been found upon analysis that 100 lbs. does not contain upon an average more than 2 lbs. of mineral matters, including lime, magnesia, oxide of iron, carbonic, phosphoric, sulphuric acid, and silica. It is the woody parts of the plant, the resinous matter of the seed, with its capsules and husks, which absorb from the soil the phosphoric acid and other fertilising ingredients. If the Flax, unlike other crops, be not allowed to return anything to the soil; if the seed be thrown into the steep pit or "retery" with the stem of the plant, and there destroyed; if instead of being employed as food for cattle, the straw or woody parts be rendered perfectly useless for all the purposes of manure, or mixing with cattle food, then undoubtedly Flax, like every other crop, would be *in itself* an exhausting crop. But practical experience, however, has fully proved that under a judicious mode of treatment, so far from being an exhaustive, Flax is actually a renovating crop. Numerous instances might be cited upon this subject. Mr. Edmonds, of Stonehouse, near Plymouth, stated, in 1843, "It is a mistaken opinion that Hemp and Flax impoverish the land; from *long experience* I have found the contrary; these are crops that make a *greater return as to manure than any corn crop.*"

Sir Richard O'Donnell, who is one of the largest cultivators of Flax in Ireland, and who has grown to the extent of 700 acres in one year, states in the *Morning Chronicle*, "As the results of many years' experience, that when grown in its regular rotation, Flax is so far from being exhaustive, that it tends greatly to improve the soil and the character of the other crops in the rotation. It is above all most valuable for laying down land after Wheat or Oats, as the process of pulling the Flax, by loosening the earth around the roots, improves greatly the quality of the Grass crop."

Mr. Warnes, whose exertions as a practical agriculturist, to promote the extension of Flax culture, are deserving of all praise, and whose system of agriculture rests upon the growth of Flax, and the fattening of cattle in boxes, upon the seed, incorporated with other produce of the farm, both summer and winter, has introduced the Flax plant into every rotation upon his farm; and, judging from the results of his own experience, he states that no rational assertion can now be urged against the growth of Flax, as the improved systems of cultivation and preparation have rendered obsolete the clauses in old leases, prohibiting the culture of the plant, and the antiquated notion that fibre and seed cannot be secured at the same time. So far, therefore, as the exhaustive character of the plant is concerned, there appears to be no sufficient ground for entertaining such an opinion.

Preparation for Market.—A further objection to the growth of Fax is, however, to be found in the nature of the process hitherto required to be employed previous to its preparation for the market. So long as it shall continue to be considered necessary for the grower to embark in the present troublesome and uncertain process of steeping the Flax in the straw, it will be in vain to expect any very general or extensive growth of the plant. Although considerable advance has no doubt been made in the preparation of the fibre during the last few years, still the present mode is far from being suitable to the great body of the farmers of the United Kingdom.

Dew Retting.—Under the system of preparing the Flax, hitherto four modes of steeping or retting the plant are resorted to. The first consists of the plan of "dew retting," or allowing the Flax to remain exposed on Grass land for a considerable number of days exposed to the action of the rain, dews, and atmosphere. The plan, however, is one which, from its obvious inconveniences, is not calculated to meet with general approval in the present advanced state of agriculture, and is indeed very rarely adopted.

Steeping in Streams.—Probably the best mode of steeping the Flax is that of placing it in running streams, according to the mode adopted in Courtrai, the principal Flax-producing district of Belgium. The Flax so prepared generally realises a much higher price than any other description of Flax. There are, however, certain peculiarities in the water of the river Lys which makes it admirably adapted for steeping purposes, and which are not possessed by any other streams in this country. Independent of the peculiarities of the water, the steeping of Flax in running streams cannot be made generally available in this country, as they are mostly too rapid in their character.

Steeping in Pits.—In the absence of suitable streams, recourse is had to a mode of steeping in pits or pools sunk in the ground. But so many favourable conditions are required to be obtained, and so many unfavourable ones to be avoided, in the selection of the site for the pool, and the supply of the water required, that it is probable that a desirable or perfect steep pool could not be formed in any part of the country. The soil forming the bottom and sides of the pit will have an influence on the colour of the fibre; clay, gravel, alluvial and peaty soil, will each impart some peculiar dye to the material, which more or less affects its value. The water used in the pit or pool must not be spring water, and it must not have flowed over any soil containing metallic deposits; and rain water is not well calculated for the purpose. But, in addition to all these difficulties attendant upon obtaining the requisite means, the grower of Flax has to contend against all the uncertainties and risks of either over or under-steeping his Flax. "One sultry night," says one of the reports of the Royal Flax Society, "while it is in the steep, and nearly rotted sufficiently, is enough to carry the fermentation beyond the safe point. So much is this feared by farmers, that almost all Flax is underwatered; and although much of it is afterwards mannered on the Grass, yet the great proportion is brought to market with the shores still unseparated in bits on the fibres." But while the sultry nights of summer are unfavourable to the steeping of Flax, and inconvenient to the farmer, inasmuch as his labourers are at that season generally otherwise employed, it is also obvious that during the winter, when comparatively little farm labour is carried on, the process of steeping must be discontinued altogether, in consequence of the temperature.

Schenck System.—A fourth process has, within the last few years, been very strenuously advocated by the Royal Flax Society in Ireland, which consists in steeping the Flax in hot water. This mode, although doubtless an improvement upon any of the existing plans, still does not afford the means of obtaining that complete separation of the fibres which it is desirable to obtain. The Belfast Society do not pretend that this is a mode generally applicable to the use of the producer of Flax, for under what they term a "division of labour," they propose that the whole process of preparation, with the profits attendant upon it, and the additional labour required, shall be taken out of the hands of the growers, whom it designates as "a class of persons ignorant of the commonest chemical principles," and handed over to capitalists or speculators who would erect the required machinery in districts where the growth of a certain quantity of Flax would be previously guaranteed. According to the reports of the Society, it appears that the profits upon the preparation of an Irish acre of Flax, would be something like 200 per cent. upon the amount paid to the grower for his produce. The farmer is paid for his Flax a price ranging from 5*l.* to 8*l.* per acre, the steeper, upon this principle of "division of labour," receiving a net profit (I take the figures of the advocates of the plan) of upwards of 20*l.*

With such *inducements* as these offered by the Flax Society, I doubt much whether the agriculturists of this country will feel very much disposed to enter upon the growth of Flax to the extent which the circumstances of the case require; and in Ireland I have no doubt but that the whole scheme, fraught with so many of the abuses of the middlemen system, will soon be found alike intolerable to producer and consumer. The whole of these difficulties may I believe be easily overcome, by the adoption of a system more in accordance with the present advanced state of practical science and knowledge, and which involves *the entire abolition* of the whole of the existing modes of steeping the Flax in the straw.

Steeping Injurious.—Not only is the present process of steeping inconvenient and unnecessary, but it is highly injurious, as it imparts its injurious dyes to the fibre, deteriorates, and gives to it an inequality of strength, which, in the subsequent stages of manufacture, are exceedingly difficult to be overcome. I have found this to be more particularly the case in the preparation of the Flax into a material capable of being spun alone or in combination with wool and cotton upon the existing machinery. I am anxious that the grower should not resort to any of the existing modes in the preparation of his Flax, for any one step taken in that direction entails subsequently the necessity of much additional trouble and expense, in addition to most materially affecting the strength and quality of the yarns and thread produced from it.

Purchase in the Straw.—The mode in which I should most prefer to purchase the Flax would be in the straw, precisely as it is left after the removal of the seed. In this state it can be dealt with, with a far greater degree of certainty than in any other, and may be, within four-and-twenty hours from the time of its being pulled ripe from the field, placed in a condition fit for preparation for spinning upon any of the Flax, cotton, wool, or silk machinery of the country.

Facility of Transit.—As there would be obviously many inconveniences connected with the transit and carriage to a large distance of a material so bulky as that of Flax in the straw, the grower might in certain cases, by the use of a common breaker and a pair of toothed cylinders, remove a great portion of the more bulky part of the plant, and thus send the fibre in a partially cleaned state to the market. The chaff obtained from this partial separation of the straw from the fibre, which contains a very large proportion of the inorganic matter from the soil, and which, not having been destroyed by the process of steeping, will form a most valuable material for mixing with cake, crushed seed, the mucilage formed from it, or other articles of cattle food.

Further Process.—I am anxious, however, to see the growers of Flax deriving the full amount of benefit which is to be obtained from the complete preparation of the material into a substance suitable at once for the markets of Belfast, Dundee, Manchester, and the woollen districts. I am aware that in the hands of individual growers the process, although not a complicated one, but which still requires some larger amount of acquaintance with the *higher* branches of chemistry than generally exists among the agricultural classes, must not be considered as generally available. I believe, however, that a plan might be very easily devised by which the Flax-grower might secure for himself these benefits, which, according to the recommendation of the Royal Flax Society, are to be exclusively engrossed by speculators and capitalists. Indeed, several applications have already been made by parties, requesting me to grant them monopolies under my patent, for the perfection of Flax, within an area of a certain number of miles in various parts of the country. I believe that such a course is one eminently calculated to rob the grower of his legitimate profits, and to retard that extension of the growth of Flax which I conceive to be indispensably necessary for the welfare of the country. Within the last few days, I have been informed of a case in which a gentleman in Ireland, who has for several years grown Flax to a very great extent in one of the districts in which a monopoly is possessed by a "steeper," under the patent system. Possessed of this monopoly over a large tract of country, such an individual has the whole of the growers entirely at his mercy, and can offer them whatever sum he pleases for their produce, knowing full well that no other available market exists for many miles. Indeed, to such an extent has this system of extortion been practised, that many of the growers have been compelled, after keeping the Flax in stack for the last two or three years, to sell for 30*s.* per ton that for which he would have received, but for this monopoly, from 3*l.* to 4*l.* The gentleman to whom I have referred has now about 700 tons of Flax in stack, which he will not sell at the ruinous price offered by the "steeper," and further states that he will not sow a single acre of Flax in the present year, unless some fresh mode of disposing of his produce is created.

Joint Stock Associations.—The mode in which I would venture to suggest this system may be prevented, and the growers be enabled to derive the full benefit of the perfection of the Flax, would be by the establishment in different localities throughout the country, by means of joint subscriptions among the Flax growers in such district, at which the preparation of the material could be carried on, and the profits derived from the process distributed at stated periods among the shareholders in proportion to the amount of shares or interest which they held in the undertaking. This system is one which has been found to work well among the cultivators of the sugar cane in the West Indies—and there is no doubt but that it would work equally well among the producers of Flax in this country.

Local Societies.—A second mode by which this object could be attained would be by the erection of suitable premises and apparatus by each of the various local agricultural associations or farmers' clubs in the country, the buildings and plant being the property of the club or association, and the use of them being allowed to members or subscribers, upon payment of such sums per ton or per acre as might be agreed upon by the parties.

Landlords.—There is also a third mode which might be made available in the case of the failure of either of the preceding plans, which is, that of the erection of the required accommodation by the landlords for the use of their tenants, upon the payment of such sums as would be calculated to cover the interest of the capital invested, and the cost of keeping the buildings and apparatus in an efficient state of repair.

Profit.—There remains yet one very important point to which I have at present only incidentally alluded—I mean, the profit to the farmer upon the cultivation of Flax. If I have succeeded in convincing you of the extent and certainty of the market which exists for the produce, and of the absolute necessity which exists for your endeavouring to obtain possession of those markets, I have no doubt that I shall be enabled most satisfactorily to prove that you can do so with considerable profit and advantage to yourselves.

Seed and Fibre.—It will be found in the first place that the profit derived from Flax under the present modes of steeping, combined with the saving of the seed, is considerably greater than can be obtained from the cultivation of *Wheat*, at present prices. Mr. Warnes states that the profit upon 14 acres of Flax, grown and prepared by him last year, was upwards of 6*l.* per acre over that of his Wheat. His figures are

| | £ | s. | d. |
|---|---|---|---|
| Prepared Flax sold at Leeds ... ... ... | 238 | 16 | 0 |
| Value of seed ... ... ... ... ... | 126 | 0 | 0 |
| | 364 | 16 | 0 |
| Deduct cost of preparing Flax ... | 140 | 0 | 0 |
| Gross profit ... ... ... ... | 224 | 16 | 0 |
| Value of produce of 14 acres of Wheat, at 38 bushels to the acre, at 40*s.* per quarter ... | 133 | 0 | |
| Total balance in favour of Flax over Wheat, not including 6 tons 6 cwt. of husks equal to Hay, 26 cwt. of tow, and many loads of refuse for littering cattle ... ... ... ... | £91 | 16 | 0 |

Seed Alone.—The above is an instance in which both the seed and the fibre were saved and prepared. There are cases, however, in which the Flax is grown solely for the purpose of seed; and others in which the seed is wasted or destroyed, the only object in such case being to obtain the fibre. In either case there is a greater profit to the grower than can be obtained from almost any other crop. Mr. Beare, probably one of the best farmers in the county of Norfolk, grows every year one or two acres of Flax after Wheat, and without manure, for the seed only. His crop last year yielded 26 bushels, which, at 10*s.* per bushel, would be worth 13*l.*; while his Wheat crop did not exceed five quarters, which, sold at 40*s.*, would yield but 10*l.*, leaving a profit in favour of Flax seed alone (the straw being used as litter for cattle) of 3*l.* per acre. I may state upon this point, as a general rule, under the present system, that, when grown for its seed alone, the Flax fibre is coarse, and is not considered of so much value as that of a finer description.

Fibre Alone.—Seed Destroyed.—Numerous instances might be adduced, from the reports of the Royal Flax Society, to show that even in cases where the seed has been thrown into the steep pits and destroyed, the profit upon the sale and preparation of the fibre was still greater than that of many other of the crops. As the example thus set is one, however, which is not likely to be generally followed by enlightened agriculturists in this country, it is unnecessary for me to trouble you with any figures upon that point.

New Process.—These, however, are returns obtained under the *present mode* of steeping and preparing the Flax. According to the plan which I venture to submit, the returns will, I anticipate, be even more favourable to the grower.
